Messrs. Leeming and Leeming's Claims for Compensation.—In reply to Mr. Shaw-Lefevre, Mr. Plunket said: The proposal in the Supplementary Estimates to pay Messrs. Leeming and Leeming £8,000 in full satisfaction of their claims has resulted from the report of the Select Committee on the Admiralty and War Office Sites, which sat this year, and by a very large majority recommended that the scheme known as Messrs. Leeming's should be abandoned, and the additional sum of £500 will be asked for the preparation of plans for extending the existing Admiralty buildings, as also recommended by the Select Committee. Messrs. Leeming have acted with perfect propriety in the matter, and from the communications which have passed between them and my department I have no grounds for supposing that we shall have any difficulty in dealing with them. Under these circumstances I see no reason for laying on the table of the House the correspondence which has taken place, but I shall willingly show the letters to the right hon. gentleman should he wish to see them.

Industrial Dwellings and House Duty.—Mr. Hobhouse asked the Chancellor of the Exchequer on Friday if he was aware that in blocks of improved industrial dwellings, wherever two or more single-room tenements were let together, the Commissioners of Inland Revenue required the payment of inhabited house duty, although the aggregate annual value of the tenements let together was below the limit of £20; whether such a practice was in accordance with the concession explained by the Secretary to the Treasury and the Chancellor of the Exchequer on the 29th of February, 1884, in the House of Commons, that such blocks of industrial dwellings were to be exempt from duty "provided only that the conditions were satisfied, that the block consisted of tenements each of which was under £20 value"; and whether, since the result of such a practice must be to discourage the proprietors of improved industrial dwellings from letting more than one room to poor families, he would consider how far the directions given by the Treasury to the Commissioners could be modified. The Chancellor of the Exchequer: The exemption from house duty which the Inland Revenue is empowered to give in the case of tenements forming part of improved industrial dwellings is limited by two conditions—namely, (1) that the tenements should be under £20 in value; (2) that they should be structurally separate from the rest of the buildings. In the exceptional cases referred to by the hon. gentleman the second of these conditions does not exist, inasmuch as the two rooms, though each by itself structurally separate, are not, when occupied together, so separate. The condition with respect to structural separation is, in strict accordance with the promises of the member for Edinburgh, as Chancellor of the Exchequer, in the debate of February 29, 1884. At the same time the effect of the rule about structural separation is in exceptional cases somewhat anomalous, and I am prepared to consider whether the rule cannot be modified in such a way as to meet these cases and to provide for exemption from house-duty of all tenements under £20 in *bonâ fide* industrial dwellings.

Coldbath Fields.—The Home Secretary, on Monday, in answer to Mr. Pickersgill, said that the Treasury had arranged that the Post Office should have at least five acres of the Coldbath Fields prison site. No part of the site had been sold to the London School Board. The Clerkenwell site was not yet sold to the School Board; but negotiations were in progress. About four acres of the Coldbath Fields site were undisposed of; but some portion of that might be wanted by the London School Board. Endeavours had been made, by negotiations with the Metropolitan Board of Works and with private individuals, to utilise part of the site for the erection of artisans' dwellings at a low rent, but without effect. The appropriation of part of the Clerkenwell site by the School Board would avoid the removal of houses and the eviction of occupiers which might be necessary if the Board purchased another site. The Clerkenwell Vestry were of opinion that additional artisans' dwellings were unnecessary.

The new free library at Folkestone is on the point of completion, so far as the external fabric is concerned. Mr. Brightwen Binyon, F.S.A., of Ipswich, is the architect, and Mr. Webster the contractor. The cost of the building will be between £4,000 and £5,000.

Extensive alterations and additions are about to be made to the workhouse at Cheltenham, from plans by Mr. Darby, of that town.

An extension of the London Southern Tramways Company from the "Swan," Stockwell, to Vauxhall Bridge, viâ South Lambeth-road, has been opened for traffic this week.

WATER SUPPLY AND SANITARY MATTERS.

Bury St. Edmunds.—The new sewerage outfall works, constructed by the corporation of Bury St. Edmunds at West Stow, were formally opened by the mayor on Thursday, the 11th inst. The sewer is egg-shaped, and is 30in. in diameter. It is built of 4½in. brick, laid in cement, and surrounded by concrete. The total length is a little over three miles one furlong. It has a uniform gradient of 1 in 642, or rather more than 8ft. per mile. At the end of the brick culvert there is a steel pipe rather more than a mile and a half in length, which carries the sewage under the river and through the marshy land on to the pumping station. At ordinary times the sewage will flow on to the sandy soil, which forms the irrigation farm, without any pumping whatever. About 22 acres of land have been laid out on two levels, and only when the sewage has to be deposited on the upper level the pumps need be used. Near the pumping station is a large overflow tank, with concrete walls. In the engine-house are two engines, driving two centrifugal pumps, each of which will deliver between 500 and 600 gallons per minute. The engineer employed was Major Fosberry, of Warwick; the contractor was Mr. Mackay, of Westminster. The cost of the works is about £25,000.

Dundee Water Supply.—Some time ago Mr. Hawksley, C.E, London, on the invitation of the Dundee Water Commissioners, made an inspection of the Dundee waterworks from Lintrathen to Clatto, for the purpose of enabling him to report respecting the improvements proposed by Mr. Watson, the engineer. He now reports that on the principal question, whether the duplicated portion of the main pipe should extend only from Pitnappie to the tank at Shanzie, or should be continued to the Loch of Lintrathen, he has no hesitation in expressing a decided opinion that the latter course ought to be adopted. The consumption of water in Dundee was so rapidly increasing that the comparatively small difference of expense—estimated by Mr. Watson at £18,000, or, at most, £20,000—ought not to stand in the way of the greater volume and greater safety of the supply, which the duplication of the main conduit between the loch and Pitnappie would effect. He had, therefore, no hesitation in recommending that this work be forthwith undertaken.

Water-closet Construction.—The town commissioners of Bournemouth have adopted a report by their surveyor, Mr. G. R. Andrews, recommending the provision of w.c. accommodation for both sexes, and of urinals and lavatories in various parts of the district. Eight groups of structures will be erected, three being reserved for ladies. The commissioners have since accepted the tender of Messrs. F. Hoare and Son, of Bournemouth, at £2,178 for the execution of the works, Mr. Andrews's estimate having been £2,368. Some of the details of construction of the four underground structures, based upon Mr. Andrews's observations in London and other towns, are worth notice, and the plan is especially suitable for watering-places. Each of these buildings will be entered by a flight of steps, closed at night by gates, and situate entirely beneath the street level. The structure will be lighted by prism pavement lights let into cast-iron frames, and ventilated by perforated iron panels and gratings laid at the road level. Ventilation will be also obtained to the water-closets by open fanlights over each of the doors to the same. The whole of the metal-work of the urinals will be of brass. The drains throughout are to be kept clear by means of hinged inspection-boxes, manholes, and covers, and have ventilating pipes carried up the gas-standard in the entrance. The floors throughout of the closets and the passage-ways are to be of Portland cement paving. The whole of the internal walls will be faced with white glazed bricks, with coloured borders and dado. The woodwork throughout, excepting the seats of the water-closets (which will be of polished hard wood) is to be of pitch-pine varnished.

Water Supply for Liverpool.—During the three months ending the 30th June last the amount expended on the Vyrnwy Waterworks was £53,497 9s. Appended is a return of the expenditure since the operations commenced:—Llanwyddyn embankment works and works connected with the reservoir, £444,835 7s. 4d.; Llanwyddn quarry, £163,304 8s. 8d.; aqueduct, £710,646 17s.; and land and easements, £265 330 12s. 9d. The total amount expended so far is £1,584,167 5s. 9d.

A memorial window representing St. Lawrence giving alms to the poor was unveiled last week at the parish church of Winslow, Bucks. The architects are Messrs. Burlison and Grylls, of London.

The death is announced of Mr. John Edward Lee, F.S.A., of Newport, Mon., the author of several works on archæological subjects. Mr. Lee was 74 years of age.

STAINED GLASS.

Cheltenham. — At St. Gregory's Roman Catholic Church a new stained-glass east window has been erected in place of an older window which was found not to harmonise with those recently placed in the transept. The principal subject of the new window is "The Assumption and Coronation of our Blessed Lady." In the lower portion of the side lights are represented, in circular medallions, "The Blessed Virgin's Life on Earth" and "Man's Redemption through the Incarnation of her Son." Between the subjects in the lower part of the centre light is seen the tomb in which the Virgin was laid after her death. This is represented as unoccupied, and lilies spring from it; while above, an escort of angels, some with censers and some with musical instruments, accompanies the Virgin into the presence of the Holy Trinity. In the dexter central light is the figure of God the Son, on the right hand of the Eternal Father, seated on a golden throne. Between these figures is our Lady about to receive the crown of glory seen above her head. About the throne attend saints of the Old Law. On the dexter side are Adam, Eve, Rachel, Miriam, Ruth, and David; while on the sinister side are St. John the Baptist, Isaias, Judith, Esther, Solomon, and Bethsabee. The background of the throne is filled with a cloud of Seraphim. In the sexfoil tracery above the centre light the Third Person of the Trinity is seen hovering as a dove. The work has been executed by Messrs. John Hardman and Co., of Birmingham.

CHIPS.

The death has just taken place at Melksham of the Rev. Edward Lowry Barnwell. He was the life and soul of the Cambrian Archæological Society, and it was mainly owing to his influence that the pre-Norman Church at Bradford-on-Avon was preserved. He was the author of several monographs on the megalithic remains of Great Britain. The deceased was the third son of Mr. F. Barnwell, formerly keeper of the coins in the British Museum, and graduated at Balliol College, Oxford, in 1834.

A life-size portrait of the Rev. Canon Pitman, who has since 1828 been Vicar of St. Mary's, Old Eastbourne, and who is now 85 years of age, was publicly presented to the corporation of Eastbourne on Monday, and will be hung in the new town hall.

A Baptist school-chapel is about to be built at Honor Oak, S.E., at a cost of about £1,100. Mr. George Baines, of Great Winchester-street, E.C., is the architect, and Messrs. F. and H. F. Higgs, of Loughborough Junction, are the contractors.

A new Wesleyan chapel is being built at Walbottle, near Newcastle-on-Tyne, from plans by Mr. B. H. Frampton, of that city. It will be Gothic in style, faced with local stone, and fitted in pitch pine, seats being provided for 220 persons.

In spite of the elaborate works carried out last winter in improving the drainage beneath the Houses of Parliament, complaint is still made that the atmosphere of the Palace of Westminster is vitiated by disagreeable smells, and the explanation offered by Mr. Bailey-Denton, who maintains that the noxious odours are due to the escape of "ground air" from the subsoil of the palace, is probably the correct one.

The Norwich school board have elected Mr. John Brown as clerk of works at the Bull Close road schools, about to be built at a cost of £11,000.

A Victoria Cottage Hospital is now in course of erection at Kingston, Herefordshire, Mr. Henry Winslade, being the contractor. Mr. Kaynes Purchase, of the same town, is the honorary architect.

A stained-glass window, designed and supplied by Mr. Rambart, Kentish Town, N.W., has been erected in the Congregational Church, Kirkcaldy. It occupies the three lights above and behind the pulpit.

The East London Water Company have advised the local board of health for Waltham Abbey that it is intended to ask the Local Government Board to put a stop to the continual flow of sewage into the Lea at Waltham Abbey.

Mr. Greville Chester, when visiting Asia a short time since, met with a quadrangular hæmatite seal which had been found near Tarsus. The seal approaches the cubical form, and is engraved on five sides. It is regarded as Hittite in character, and resembles in several features a circular seal from Yuzgat, acquired for the British Museum last year. On the base or principal face of the seal there are, within a border of interlaced pattern, two figures, of which one, seated, has in his hand some flower with a long root; while another, standing, presents a trident-like object. Two other trident-like objects occur in other faces, and also a number of equilateral triangles, a symbolical design also employed on the seal from Yuzgat.

Our Office Table.

Mr. E. de Lisle, M.P., little discouraged by the unfavourable reply he received in the House of Commons the other night from the First Commissioner of Works, appeals to the public for sympathy and support in his proposal to complete the mosaic decorations in the Central Hall of Westminster Palace. The existing mosaic of St. George, by Mr. E. J. Poynter, R.A., may not, he admits, be faultless, but Mr. de Lisle contends that the general effect is at least bright and splendid; and since it only cost £650, he hopes that the next estimates will provide that a sum not exceeding £3,000 may be devoted to the representation of the patron saints of Scotland, Ireland, and Wales, together with their appropriate heraldic emblazonings and badges. As to the alternative proposition to fill the four compartments with fresco paintings, Mr. de Lisle points out that frescoes would neither withstand the damp and chemical effluvia, nor would they be effective in a hall blazing with gold and colour, and lighted by stained glass windows.

Mr. Cavendish Bentinck's well-known irruptions into debate in his capacity of amateur art critic are always amusing, and more particularly so on Tuesday night. The vote was for the Science and Art Department, and in this connection Mr. Cavendish Bentinck waxed eloquent. The right hon. gentleman was contending that the knowledge of architecture among the working classes is of the haziest kind, because they have not examples and models before them. By way of exemplification, he remarked that many members of the committee would know that weighing machines had been set up at many of the metropolitan railway stations. "Well," he proceeded, "the tops of these machines are supported by two pillars. One of them is supposed to be Ionic, and the other Doric. But as a matter of fact, they are nothing of the kind; they are simply German." We shall have to offer a prize, when the Designing Club is resumed, for an architectural weighing machine in the German style.

The Manchester meeting of the British Association will be opened on Wednesday evening next, and will conclnde on the following Wednesday, September 7th. The President-elect, Sir Henry E. Roscoe, M.P.,F.R.S., will deliver an address, which is expected to take the form of a review of the progress of chemistry during the past fifty years. The sections under which the meetings will be held are: A, Mathematical and Physical Science, Sir R. S. Ball, president; B, Chemical Science, president, Dr. E. Schunck; C, Geology, president, Dr. Henry Woodward, whose address on the arrangement of museums is expected to give rise to some discussion; D, Biology, president, Prof. Alfred Newton; E, Geography, president, Sir Charles Warren; F, Economic Science and Statistics, president, Mr. Robert Giffen, L.L.D.; G, Mechanical Science, president, Professor Osborne Reynolds, who will probably deal in his address with the achievements in mechanical science accomplished since the Association last met in Manchester, 26 years ago; and H, president, Professor A. H. Sayce. Excursions to places of interest in the neighbourhood of Manchester will be made on the afternoon of Saturday, Sept. 3rd, and on Thursday, Sept. 8th.

Mr. Edward Armitage's picture representing "The Institution of the Franciscan Order" in 1209, which was one of the chief features of the recent Royal Academy exhibition, was unveiled on Sunday in the Roman Catholic church of St. John, Duncan-terrace, Islington. The new work, which was illustrated in our issue of the 17th June last, replaces a fresco of the same subject painted by Mr. Armitage in 1859, which has so far decayed that restoration was impossible. The general plan of the original fresco has been retained, but heads, hands, and draperies have been re-studied from nature, and the artist has aimed at giving greater individuality and precision to the new work. In the new work noteworthy points are the grey dress selected for the Franciscan monks, the brown garments not having been adopted for some time after the establishment of the order, the domical form of the Papal tiara, encircled by a single crown at the base, and the low mitres of the attendant bishops. Mr. Armitage has previously been a munificent donor to St. Duncan's Church, having presented it with his picture of "The Meeting of St. Francis with St. Dominic," and also restored the side chapel at his own cost.

We published on July 1, page 37, particulars of the prizes offered by the Council of the Society of Arts to art workmen, and may remind those who propose to compete that all articles must be sent into the society's house at John-street, Adelphi, W.C., by to-morrow (Saturday). The prizes are offered in the following eight classes:—1. Painted glass, £25, £15, £10. 2. Glass blowing in the Venetian style, £10, £5, £3. 3. Enamelled jewellers' work, £25, £15, £10. 4. Inlays in wood, with ivory, metal, or other material, with or without engraving, £25, £15, £10. 5. Lacquer, applied to the decoration of furniture or small objects, £25, £15, £10. 6. Decorative painting on wood, copper, or other material, applied to furniture and internal decoration, £25, £15, £10. 7. Hand-tooled bookbinding, £25, £15, £10. 8. Repoussé and chased work in any metal, £25, £15, £10. The prizes will be awarded to workmen only, and the works will remain the property of the competitor. Prices may be attached to articles sent in, and sales effected no charge be made in respect of any such sales. Each work sent in competition must be marked with the workman's name or that of the manufacture, or, if preferred, with a cypher accompanied by a sealed envelope giving name and address.

By a happy thought, the lines of Liverpool Castle were marked out in limewash on the pavement of St. George's-crescent and Derby-square, in that city, for members of the British Archæological Association, who inspected them on Friday morning. A notice in the Exchange Newsroom attracted many of the merchants and brokers on 'Change, who went during the day to see the site. The keep was drawn out on the north side of St. George's-crescent; the gateway barbican, with two towers, projected into Castle-street; the north-west tower came close up to the National and Provincial Bank; and the south-east tower was on the south side of St. George's-crescent. Other towers were covered by the site of St. George's Church. The castle was not removed till the early part of last century, so that plans dating back to 1660 enabled the site to be ascertained with absolute precision. The plan for these lines was made by Mr. E. W. Cox from old records and plans, and was marked on the ground by Mr. Samuel Phillips.

CHIPS.

A new organ, built at a cost of over £400 by Mr. Alfred Kirkland, of Holloway, N., was opened on Tuesday at the New-street Baptist chapel, Burton-on-Trent.

Mr. Enoch Clutterbuck, the contractor for the Quay improvement at Gloucester, having stopped the works, it was agreed by the city council on Tuesday, at the request of his sureties, that the contract should be completed by Mr. W. M. Colchester Wemyss, at the same price as Mr. Clutterbuck's, and with the same guarantees, but with an extension of time.

During the past week there has been erected at Weston-super-Mare a large beacon for the purpose of marking the line of the Atlantic cable, and to act as a warning to small vessels which anchor in the bay. The beacon consists of a wrought-iron tube 3ft. in diameter, and is fixed on the foreshore near low-water mark. The bottom part of the same is sunk about 35ft. below the surface of the mud; the upper part of the tube is diminishing, and on the top is fixed a large wooden mast 30ft. in length, and which carries an iron cage 5ft. 6in. in diameter upon its summit. The total height above the mud level is 51ft., and about 18ft. above ordinary high water. The whole has been carried out by Mr. A. Krauss, contractor, Bristol.

A town hall is proposed to be erected at Lewisham; estimated cost, £8,000. Mr. Albert L. Guy, 78, High-street, Lewisham, is appointed architect. The building is to contain shops, offices, large hall to seat 1,000, two small halls, &c.

The City Corporation have received a report from a committee recommending that the sum of £47,500 should, with the consent of the Charity Commissioners, be applied to the purchase of Clissold Park as an open space.

At the triennial visitation in his cathedral church on Monday, the Bishop of Bangor said the work of church building and restoration had been going on as steadily in the diocese as in the past. Since the last visitation new churches had been built at Dolwyddelan, Criccieth, and Llanberis; four churches had been well restored, and a tower and spire had been added to Christ Church, Carnarvon, the approximate cost of all these works being £16,500. Besides these, there was a new church in course of erection at Pwllheli, and another at Bangor.

By command of the Queen, the Society of British Artists will henceforth be styled "Royal."

Mr. Brougham Glaisher, of Spring-gardens, W.C., writes that the only damage occasioned by the recent fire at Knole House was the destruction of the roof and internal floors of the stone-built tithe-barn, an ancient structure measuring 150ft. by 50ft. and 50ft. high to eaves, and some injury to the carriage stables. As soon as the barn is reinstated, the building will have much the same appearance as before.

The autumn exhibition at the Manchester City Art Gallery will be opened to the public on Tuesday next. The Exhibition Committee have been assisted this year by Mr. Marcus Stone, R.A. The works number some 700 examples in oil and water colour, and are confined strictly to the seven regular exhibition galleries in the building. It is understood that the work shown is good, all the Academicians and Associates of the Royal Academy and other distinguished artists having sent examples.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, post free.—LESSER FRIEDLANDER, Tobacconists' Complete Furnisher, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 60 years.

Holloway's Pills correct all irregularities and weaknesses. They act so kindly, yet so energetically, on the functions of digestion and assimilation, that the whole body is revived, the blood rendered richer and purer, while the muscles become firmer and stronger, and the nervous and absorbent systems are invigorated.—[ADVT.]

HYATT'S LENS and "SEMI-PRISM" LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1704.
FRIDAY, SEPTEMBER 2, 1887.

INTERNAL WALL SURFACES.

SOME years ago all architects were taught by many of the realistic preachers gainst shams that it was positively ini-uitous to plaster the walls of their churches id other public buildings. Mr. Ruskin was ne of the foremost among those who pro-sted against the imitation of natural sub-ances. In his "Stones of Venice, he says: There is not a meaner occupation for the man mind than the imitation of the stains id striæ of marble and wood." Many archi-cts, including the late Mr. Street, practised e same doctrine, and we know at least of vo or three churches where the plaster was ripped off the old walls and the rough stone ce was left. Puritan whitewash was no oubt an abomination, but it was only a vering up of dirt—it was cheap, and at any te cleanly. There were some architects, id amongst them the late Sir Gilbert Scott, no took a more reasonable view of the sub-ct. That eminent restorer boldly contended at an internal wall surface should not be ft rough, and pointed to the ancient build-gs of the greatest periods of art where the lls were carefully faced internally with rough stone or plaster and decorated. This mmon-sense opinion has at length over-me the feeble arguments of the ultra-alistic Goth. Mediæval buildings of un-phisticated purity, never tampered with by ritans and churchwardens of the 17th ntury, are to be seen, in which plaster is ill visible. We may point to the ruins of nventual buildings never touched by oderns where traces of plaster and stucco ay be seen on the walls as a covering to the ugher stonework. In many of the Cister-an abbeys, where rubble stone was used the clerestories and vaults, the plaster ay still be found hard and firm; on some them are found the remains of painting. et the absurd practice of which we speak as destined to find admirers and to become opted. In a paper read by the late Sir lbert Scott at Northampton in 1874 he uded to this custom in the following rms:—" . . . We now see churches ose interiors are faced with rough brick-rk, relieved, perhaps, with lines of red and ck, and others in which the modest rubble pointed with the blackest mortar, in-niously combining the harshness of barbar-n with the disingenuousness of civilisation. is a duty to protest against making our urches the field for the exhibition of such aries. Let those who, satiated with feeble inement, can find no relief but in still aker affectation of barbarism, confine their k to their own drawing-rooms; but let our urches be spared. Numbers of fine old urches have been stripped internally and luced to a nakedness compared with which ritan whitewash is decency." Another mpion against this affectation of truth is be found in Lord Grimthorpe, who, while notices Sir Gilbert Scott's strictures, nementy protests against the absurd rage. s attack is vigorous, and is well worth ding at this time, when all that can be id against it has come true. He says of s anti-sham sect that "they rage against nting deal to look like oak, and go about aning church interiors of their genuine ient Gothic plaster and exposing rough lls, such as you would not leave in the llery of a cottage, though at other times y will go and daub all this same plaster r with their own vulgar painting, making double sham, if plaster is one. And lately, by way of a specimen of consistency, we have had some of this school, headed by a Gothic architect of the straitest sect, wanting to cut off the stonework of St. Paul's in order to veneer it with marble," and the same vigorous writer goes on to accuse Mr. Ruskin of preaching against shams and still finding praise for the Italian builders who have veneered their churches with thin marble slabs.

The fact is, as we have said in another place, it is not dishonest to cover one material with another so long as we do not misrepresent facts. Now, making deal to look like oak or any other wood, or painting plaster to imitate stonework, is certainly an inexcusable sham, inasmuch as it purposely misrepresents the material. Plaster does not, it cannot be, mistaken for any other material if treated simply as plaster, or made the ground of painting upon; therefore plastering is allowable. We quoted Ruskin just now in reference to the meanness of imitating marble and wood, and he is perfectly right in denouncing all kinds of marbling and graining, for it is opposed to the principle we have enounced. But the anti-sham craze has at length given place to rational views of this matter. We see no more churches with rough rubble walls or rough brickwork. When brickwork is used internally, it is neatly executed; the bricks selected are of a uniform colour, or are disposed in diapers and bands. In several new churches the architects have introduced terracotta in the brick walling, and its use as a lining for walls of brick or stone is worth attention. The other day we saw a church designed by Messrs. George and Peto, where square terracotta slabs with ornaments stamped on them were arranged as a diaper round the walls of the chancel. The effect was admirable. For more decorative treatments, the "faience applique" of Burmantofts, manufactured by Wilcock and Co., can be employed, and this kind of lining or veneering, if it can be so called, is certainly more rational than a veneer of marble, which may misrepresent a solid wall of that material. So with all terracottas and glazed Doulton ware, which allow of ready fixing to the wall, and are impervious to dampness as well. Architects have no ground of excuse for employing shams when they have materials of this kind they can use, partially or wholly, for their wall linings when something more decorative than plain plaster is required. We are quite sure the rage for rough brick and rubble as a finishing is past, and if we cannot get wall materials better than these, there is no other plan so good as to plaster and relieve by simple patterns such as were used by the old architects, and have been discovered under the layers of whitewash at Salisbury, Worcester, and other cathedrals and churches.

PREPARING PLANS.

PREPARING plans! Every architect knows what this means, but how few are those for whom plans are prepared who understand the labour, the thought, and the cost involved in the work of preparation. There are many who think architects' designs are kept in stock and pigeon-holed; that it is easy for an architect when he once knows the extent of his client's pocket to go to a drawer and take out a set of plans that will exactly suit, much in the same way as a retail shoemaker, after measuring the foot, can bring half a dozen pairs to try on. Surely, they argue, the plan of one house will do for another, with slight alteration. If the elevations are not right for the roads, the plan can be turned round. To them the matter is easy and simple enough. Aspect and prospect are immaterial to such people, especially in towns, where those conditions cannot be chosen at pleasure. Besides which, modern art is supposed to overcome the necessity of a good aspect, as any temperature can be obtained all the year round by improved stoves and apparatus. These opinions prevail, and are increasing, and they have increased more since building houses has been taken over by the speculator who builds wholesale in the hopes of suiting all comers. But the architect has fostered the notion as well by building houses alike, by catering to ignorant and stupid clients, and by careless designing and copying. The art or science of planning buildings differs from the art of the shoemaker or garment maker in the fact that it is more than a mere mechanical art of fitting. It is one of creating pleasure and enjoyment as well. Yet a garment may delight and please as well as fit, the material and the style may be admirable for the wearer, and these constitute its claim to the rank of an art; but designing a building ought to be something more than this. A house cannot be so readily thrown aside as a dress; there it stands to give pleasure or pain to one generation after another. There is one thing that distinguishes the work of the architect from that of the tailor or *modiste*—viz., adaptation to circumstances. A garment has to fit the figure and the climate only, but a house has to suit not only the occupant and climate, but the surroundings, the prospect, the soil. If it does not do so it is a failure, and its rank is no higher than that of a garment. More than half the houses built in our towns are of this inferior class. They are "manufactured" to suit a by no means critical public, who are constantly shifting from one part of town to another. We cannot be surprised that the architect's labour is valued at a low rate, and that the practice of preparing plans for houses has very much fallen off. They are now to be selected from dozens already in the market. The practice of speculating builders and ready-made architecture has affected mainly the provision of dwellings and residences of a certain limited cost, and it has to that extent injured the prospects of the architect. His main chance will therefore be in using his best efforts to re-establish the old and only satisfactory system by showing the inferiority of such building.

The custom of preparing plans for structures, like other duties, has very much fallen into a groove amongst some architects. If it is not exactly the pigeon-hole routine, it is one very like it. The client wishes to see a number of plans of buildings, if he does not refer to an example he likes imitated. The architect complies. If he manages to "hit" his client's wishes, well and good; if he does not, he tries again, and after a series of compromises, in which the building owner gets the best share, a plan is agreed upon. A too ready compliance with the notions of the client is one of the pitfalls of the inexperienced architect. The client is a man of the world, has travelled and seen a good deal, possibly more than his professional adviser; and herein lies the difficulty. Though a man may be brimful of ideas and "fads," he may not have the slightest knack of arranging and putting them into form, the result of which is there is either a yielding or a struggle. The young architect is inclined to give in, and the building owner gets it all his own way. In nine cases out of ten the client is the first to grumble if anything is wrong. The architect gets the credit or discredit, and is further accused for not insisting upon what he considered to be the proper arrangement. His complacence has cost him much trouble and uneasiness; the very things to which he gave in have become sources of annoyance.

In the preparation of plans, say, for a gentleman's residence, the client's requirements ought first of all to be consulted; an idea of the size of rooms is important, bearing

always in mind that people unacquainted with dimensions make often egregious mistakes as to the size of rooms. The matter of arrangement should be left absolutely to the architect, and it is necessary that he should be firm in deciding which is the most desirable disposition. Once he allows interference on this point he will be landed into all sorts of difficulties; the client will assert his right to do this or that with the consequences we have foreshadowed. This should be undoubtedly the architect's prerogative, though, strange to say, it is the plan in which a client often tries to have a finger, and, as a purely technical representation, only a practised architect can really see the effect of this or that alteration. We have known a plan submitted to the whole family and relatives for suggestions, and returned with such sundry instructions that it has required the patience of a Job to incorporate all the ideas. It may in some things be true that in a multitude of counsellors there is wisdom; valuable suggestions are sometimes made in the matters of detail; but the final judgment ought to be left exclusively to the architect. In architecture at least "many cooks spoil the broth." In plans of other buildings interference is less common, the reason being that the architect is trusted whenever the employer feels his own ignorance. Great Government buildings in which intermeddling has been common are not successes. Then, again, in competitions for public edifices, like municipal offices, it is questionable whether the highest results have been obtained by requiring the competitors to design their work on a set plan. In short, if an architect is to be no more than a simple draughtsman of other people's ideas, he had better put himself up in that capacity, and not lay claim to the title. We do not hamper the sculptor or the painter with ideas; he is master of his own arrangements and conceptions; could we expect a work of sculpture or painting from one who was restricted as to form and treatment? Certainly not. Yet the architect is supposed to yield here and there; he is restricted in the requirements and cost. Many architects have little time for thinking over plans, which makes matters worse, and they introduce improvements and modifications as the work proceeds—a course that is never wholly satisfactory.

The preparation of plans for a new building involves more than even some architects imagine. A set of geometrical drawings is not the end but the mechanical means employed to render intelligible to workmen the architect's meaning, though they are thought by many to be the whole work, and that as soon as they are prepared the architect's labours are over. They are part of the instructions merely. The notion of the architect that he is the mere preparer of drawings is a modern one. If an architect's work was ended when his drawings were finished, and he had simply to draw them, the mere draughtsman could fairly call himself an architect. We all remember what the *Quarterly Review* some years ago had to say about architects, and how it offended many of the profession. The writer's theory was that a building designed by working men on the co-operative plan was perfect, though the example he gave shocked everyone possessed of taste; but the unfortunate illustration chosen did not make the idea wrong. We suspect all our great cathedrals were planned on the co-operative system, whatever may be said to the contrary. We gather from many sources what kind of architects were employed. Gervase, in his account of Canterbury Cathedral, tells us something about William of Sens, who rebuilt the choir, and who met with an unfortunate accident by the fall of the scaffolding in 1179. Being much injured, he was able only to direct the work from his bed by calling in a young monk whom he selected to carry on the works. This monk was the successor known as "William the Englishman," whose work is so well known. There is nothing to show that either of them were mere draughtsmen, but they clearly were constantly at the works. Drawings of some sort were prepared, though probably they were rough ones, such as are employed by foremen in the setting out of works; details were left to the master workman. After all there is a great deal in this view. The architect's work by no means begins with the drawings and ends with them, as many think. His labours ought to commence long before he puts a line on paper. Does he go and see the site for himself? We are inclined to think very few take this trouble; and yet how can sections be prepared and quantities taken out without knowing the soil and subsoil? These things are guessed at; a certain depth is taken, any increased depth being allowed as an extra. The natural levels and drainage are of the first importance before a plan can be devised. Hundreds of buildings and houses are either half buried, or do not take advantage of the natural fall of ground. Quite as great an omission is the adjustment of a building as regards aspect. Architects cannot now, as they did years ago, choose their own sites; but they can exercise their judgment. The monastic ideal was a low, sheltered valley, and the same notion has prevailed more or less since. The Elizabethan builders, who had an eye for picturesqueness, loved such spots; but modern sanitarians and physicians tell us to avoid all these low, sheltered sites, however charming, for, where morbific influences are, there lurks rheumatism, and fever miasms hang about the still air of these charming valleys. On the contrary, the high and dry site enjoys immunity from disease. Frequently the air on the mountain top, even in severe frost, is warmer and more genial than it is in the valley, for the cold air has a tendency to flow down the mountain sides. Gardeners find that the plants at the low levels and in valleys suffer more from frost than those on higher parts; but the elevated situation has the further advantage of being drier, of commanding finer views, and a more rarified atmosphere. In the preparation of plans, the first thing is to decide, if it is a house, the best aspect for the principal rooms. The south or south-east is, of course, preferable, though this may not always be obtainable without sacrifice of prospect. Here the architect's administrative skill is called into exercise. A few points to the east or west may make all the difference; but we often see houses built with the living-rooms due west, so that they get not only the hottest sun, but more of it, as the sun is lower in this quarter than when it is in the south, and, therefore, enters the room more when people can least bear it. And, after all, perhaps it was wiser to study aspect before prospect. Window openings are left to chance, though their width and height ought properly to have some reference to the extent of the entrance of the solar rays when they enter and leave, also to the position of bedstead and fireplaces.

In the planning and design of town buildings, the question of casements is one that ought to be ever present. Reference to adjoining properties which have dominant rights of light must determine heights of stories and the position of windows. But how few plans take the matter into account; the consequence of which is that the client is stopped by mandatory injunction, and damages or legal expenses are incurred. All might have been saved if the architect had at the commencement of his work found out the rights and obligations of the owner. Affecting also the preliminary work of the architect are points respecting boundaries, party walls, easements of support, involving careful inquiry and labour. So much for external conditions. There are various points concerned in the interior economy which ought to be considered at the outset. In designs for public buildings, a basement is always useful for heating apparatus, storage, or electric lighting. In plans of basements, we often find very little to indicate study of the requirements of this part; the walls of portions are simply carried down without any arrangement for flues or inlets for fresh air. In schools and public assembly halls the whole scheme depends on the proper proportion and arrangement for seating so many people or children. The entire plan ought, in fact, to be developed from the assembly hall or schoolroom, for which purpose the proper unit or floor area for every person and the distribution of the seats are of the first importance. A hall for speaking or concerts is much too often the replica of another or a modified copy of a similar room having no special reference to the position, aspect, currents of air, or surroundings. It is too late afterwards to find that no one can hear, that there is an echo, that the orchestra is at the wrong end of the room or ill-shaped, or that an error has been repeated. So with seating, the plan may fail owing to a trifling fault that could have been discovered by a few benches placed in position. Plan preparation, in short, ought to be considered in the light of an independent study—a study of particular circumstances under special conditions of locality, material, and use. Instead of which the design is looked upon both by architect and client as too much of a commodity, by the former as the choice of a precedent, and by the latter the acceptance of it, the result being satisfactory or not, according to the experience of the architect.

STONE STRUCTURES: THEIR DECAY AND PROTECTION.

THE apparently rapid decay of the stone of many of the older churches and public buildings in London is forcing itself upon the attention of the authorities. Unhappily, it is not always possible to pronounce a stone building safe or not, until the stonework is removed and various works undertaken; or we should not have to witness what looks like the mutilation of a church in the Strand regarded by all architects and admirers of Renaissance architecture to be one of much beauty and interest. Mr. T. G. Jackson, F.S.A., in a recent letter, to which we referred in our last issue, has raised a timely appeal on behalf of St. Mary-le-Strand and other churches of the Revival. Mr. Jackson points out truly enough that the church has particular claims; for the "actual beauty of its architecture and the unrivalled advantages of its position it has scarcely an equal in Europe." Englishmen are apt to run into ecstasies over buildings of hardly greater pretensions in European cities if they occupy positions of prominence; and it is chiefly for the eminently picturesque situation of the Strand church that admiration must be accorded to it. It forms one of the most pleasing of the series of etchings by Mr. Ernest George, and has been repeatedly made the object of the architectural landscape painter. Though the increase of traffic in the Strand has led many to view the edifice as an obstruction, in reality it is not so. If, as the accomplished and versatile Surveyor of Pictures to her Majesty, and other writers have suggested, the premises on the north side were set back a little, the church would fairly divide the two streams of traffic going eastward and westward; indeed, so long as the block behind it is allowed to stand, the church is a valuable mask to the unsightly premises in its rear, and the Strand would be a loser by the removal of the church. The unique steeple of three stories, as we lately pointed out, is an ornament that is seen a long way off both eastwards and westwards

n the Strand. In addition to its external fea-ures, the church possesses a finely modelled oof of characteristic interest, some good arving on the pulpit, and a very richly ecorated apse, all of which are of interest o architects who admire the English Renais-ance. The evidence of Mr. Butterfield and f Mr. Henry Poole, mason to Westminster bbey, whose letters on the question we eferred to last week, is satisfactory as eassuring the public of the stability of the abric. The only portions of the building ikely to become dangerous are the cornices nd the vases, and when these are properly ecured, as they doubtless will be, the struc-ure will be perfectly safe. Mr. Poole peaks from experience, having been requested o examine the parapets and vases in 1878 by Ir. Butterfield, and expresses his surprise at hat he considers the needless work being arried on at the church. We presume that he orders for taking down the vases would ot have been given had not their condition ustified their removal. To take them down ntirely would be to rob the church of im-ortant ornaments which add much to the utline and beauty of the façades; and we hould be sorry if such is the intention of he authorities. We believe, on the contrary, hat the architect to the vestry, Mr. Vicars, ill see fit to restore these accessories. Sir . C. Robinson and Mr. J. Knight Watson, hose letters we reprint elsewhere, support he retention of these features. One or two f the vases look as if they were broken in vo or three pieces, possibly through the orrosion of the iron bolts which hold the arts together.

We have alluded to these instances of ecay of stonework to point out the nger to which our stone edifices are posed. For there is the danger of cidental dislocation of stonework through ghtning discharges, such as we referred to st week, frosts, and other disturbances; d secondly, the danger arising from build-gs of historic interest being shorn of their tails and features. In these utilitarian nes, when everything is valued for its oney worth or its utility, there is a strong mptation to remove or to mutilate by lop-ng-off features that are considered in the y or are dangerous. The Metropolitan ard of Works cannot be expected to enter-n any sympathetic feelings for old build-gs, or any tender regard for architecture, ich less for archæological remains. Temple r was removed because it was in the y, and there was a reason, and similar sons will be found for the removal other buildings in the City if the rdians of our public edifices suffer them fall into a dangerous state of repair. cay of stone is the cause of all the mischief, ecially when the masonry is secured by n cramps or bolts. All our Portland stone ldings which have been erected a hundred rs or more show the marked ravages of e; the surface or original faces have in posed situations disappeared by a kind of sion which, while it does not affect in-ously the centre of the stone, has con-rably reduced or worn away the surface. is the stone vases taken down from St. y-le-Strand exhibit in a remarkable ner this kind of wearing down, though nd within. One of the vases is much inished in the upper part of the body, the ulated ornament carved upon its surface entirely disappeared on the exposed side, gh the surface feels hard. On other vases ornament is fresh and sharp, and can easily traced. This kind of erosion observable in all the old City ches of stone: the material is sound gh, and in some cases is hardened n outer skin; but generally an erosion on gradually on all the exposed faces, nouldings disappear or are nearly lost, he profile assumes a rounded shape just see in the worn pebbles of flint on the seashore, or what takes place in all cemeteries when white and veined marble monuments are closely inspected. The cementing or calcareous material is gradually washed away or dissolved by the smoky atmosphere and rain, leaving loose grains of shells or carbonate of lime, which is rough to the touch. In course of a few years this process is carried to such an extent as to break away the surface and arrises, and the surface, when scraped, is found to disclose the hard stone underneath. But decomposition varies in the stones of the same building. At St. Paul's Cathedral we may find the "pitting" or washing out of the mineral grains which compose the stone on the exposed sides, the cornices appear to have suffered much in this form; in other parts lamination is observed, or rather exfoliation of the surfaces; but generally it will be found the first process is the most general. The solvent action of the rain and acid in the atmosphere loosens the cementing material holding the grains together, and this pitting or erosion takes place leaving ridges or hard nodules of harder flinty substance. What have chemists done to arrest the process of disintegration? Very little. Chemistry has not helped the architect or mason to stay the action of acids which it can thoroughly explain, and while it has pointed out the causes of decay in stone with precision, it has signally failed to supply an antidote to the ravages of atmosphere and smoke, or to give the mason rules how to lay the stone. To fill up the pores with oleaginous substances has not been generally successful, and we have no positive evidence of the permanent resisting power of waterproofing by paraffin, sulphur, and oil. All that can be said is that these processes have done good for a time by arresting the action, and that they are harmless. If periodical examinations of our stone buildings were made, and the waterproofing solutions re-applied, there might be some chance of arresting dangerous decay. Architects have learned many things since these buildings were erected. One is the unreliability of iron. They now know that iron dowels and cramps are not to be depended on, and that if copper cannot be used slate dowels run with cement are to be preferred. The oxidation of iron when it is exposed to the moisture of the air is certain to become an agent of destruction, and we cannot insure protection to it long when the stone decays. The lead or cement with which it is run then becomes useless, and we should always recommend brimstone to be used in preference to lead for insertion into stone. The proper or natural bedding of stone is equally important as a condition of success.

BUILDING MATERIALS.—III.*

By W. Y. Dent, F.C.S., F.I.C.

Of all natural productions, there is not one of greater importance to the builder, or that is applicable to so many manufacturing purposes, as limestone, this being the general term by which all rocks may be designated which have carbonate of lime for their basis. These calcareous deposits belong to several geological formations, and differ materially from each other both as regards their chemical composition and their physical character, being sometimes in the form of a dense hard rock, as is the case in what is known as carboniferous or mountain limestone, many of the beds of which are of great thickness, consisting of nearly pure carbonate of lime. In the limestones of the Lias, on the contrary, the carbonate of lime is associated with silica and alumina in proportions varying from 10 to 20 per cent., of which we have examples in the limestone of Abershaw, in Glamorganshire, the Barrow limestone in Leicestershire, and the limestone of Warwickshire. These Lias deposits consist of comparatively thin layers of hard limestone separated by others of a more argillaceous character, or shales, containing various proportions of carbonate of lime. The Lias district extends from Lyme Regis, in Dorsetshire, to the north-east of Yorkshire, the limestone being worked chiefly in the counties of Dorset, Warwick, and Leicester, yielding, when calcined, the best description of hydraulic lime. In the chalk districts of Kent and Surrey, we have in the upper white chalk a soft description of comparatively pure carbonate of lime, and in the grey chalk which lies immediately below it, we have a carbonate of lime of a somewhat harder description, associated with a small proportion of argillaceous matter.

One of the most wonderful and curious formations of limestone is that which results from the agency of the coral polype, which possesses the power of abstracting carbonate of lime from the water of the ocean, and is thus enabled in warm climates to construct those enormous reefs which, in some cases, extend for hundreds of miles in the Pacific and Indian seas. The coral, as produced, is carbonate of lime, soft and porous at first, but it gradually becomes hard and compact, so much so that it is capable of being used as a building stone, as is the case in some of the South Sea Islands. In the course of its formation, all kinds of marine *débris* get mingled with it, which, when cemented together, produces a rock that bears a resemblance to some descriptions of the older limestones. The sediment resulting from the trituration of the coral when deposited in sheltered water channels produces a material similar in appearance to chalk, whilst the coral from reefs that have been upheaved by volcanic agency is found to be of a sparry or crystalline character. These coral reefs occur in every stage of development, from the coral that is daily growing to that of a compact solid mass resembling some of the softer marbles, and thus, owing to the changes that take place from the action of the waves, and to the elevation or depression of the ocean bed, a coral reef eventually becomes a more or less compact limestone, so that as the result of the labours of the coral polype, we have deposits which represent several varieties of limestone.

Carbonate of lime is found in a state of chemical purity in rhombohedral crystals, as Iceland spar, which (as is well known) possesses the property of refracting light in a peculiar and remarkable manner, and has hence received the name of double refracting spar. Carbonate of lime is also found in six-sided prisms, known to mineralogists as aragonite, so called from Aragon, where it occurs in large mackled crystals, in the gypsum deposits of that part of Spain. The form of crystal assumed by carbonate of lime depends upon the circumstances under which the crystallisation takes place, such as temperature (the tendency to the formation of aragonite being greatest when it crystallises from warm solutions), the degree of concentration of the solution, and the presence of foreign substances. Its purest form as a rock is that of white marble, the coloured marbles containing iron, manganese, and carbonaceous matter. The proportion which the carbonic acid bears to the lime is as 22 to 28, lime itself being an oxide of calcium. Calcium is a light malleable metal, somewhat harder than lead, tarnishing rapidly on exposure to the air by the absorption of oxygen; when heated to redness it burns with a brilliant, scintillating white light. It has not received any practical application in the arts, and is only capable of being produced in very small quantities for experimental purposes.

By exposure to a red heat, under ordinary circumstances, carbonate of lime is decomposed, the carbonic acid is driven off, and the lime remains in an uncombined or caustic state. The time required for completing this decomposition depends upon the character of the limestone, and the circumstances under which the "burning" (as it is termed) of the limestone is conducted.

If carbonate of lime be heated in a confined space, such as a close retort, where there is no possibility of the escape of carbonic acid, complete decomposition cannot take place, however high the temperature may be raised; the limestone becomes surrounded with an atmosphere of carbonic acid, and until this is removed its further decomposition is arrested. Chalk under such circumstances may assume a highly crystalline condition, and thus in nature we

* Being the Cantor Lecture delivered before the Society of Arts.

find dull granular limestones that have been altered in their character by the intrusion of an igneous rock; we have an example of such conversion in Rathlin Island, off the north coast of Ireland, where two basalt dykes ascend through the chalk, converting the latter into a fine granular marble. Experiments were made many years ago which proved that when the carbonic acid liberated was rapidly carried off by a current of steam or air, the rapidity with which the limestone was decomposed was increased, a fact which it may be well to remember in discussing the merits of different modes of calcining. The process of "lime burning" is carried out in several different ways, in comparing the advantages of which it is necessary that the various circumstances that bear upon the question, such as the character of the stone and the amount of lime that can be disposed of in a given time, should be considered.

Whether the operation be carried out in the simplest manner, or in the kilns constructed on the most scientific principles, much will still depend (both as regards the quality and quantity of the lime produced) upon the kilnsman, for it is only by constant observation from day to day that the eye becomes capable of judging whether the proper temperature has been reached, or that a correct opinion can be formed as to the effects produced by the various disturbing causes which exert an important influence upon the working of a kiln, such as its size, shape, the character of the limestone, the quality of the fuel, and the state of the atmosphere.

The kilns usually employed vary as regards size and shape in different districts, consisting generally of inverted cones or ellipsoids, into which layers of limestone and fuel are alternately thrown. When worked continuously as running kilns, the lime is periodically withdrawn from below, fresh quantities of stone and fuel being filled in at the top. It is obvious that the consumption of fuel must be much less when worked continuously than is the case when, after every charge, the kiln is allowed to cool down before the lime is removed. It is very difficult (even when every care is taken) to obtain from ordinary kilns, when worked continuously, a uniformly satisfactory product; the temperature is not sufficiently under control, and sometimes increases more rapidly in one part of the kiln than it does in another; or not unfrequently a block occurs, and a mass of stone and fuel remains immovable for a considerable time, and when this stoppage is overcome the mass gives way, and a quantity of lime and half-calcined limestone comes down together. Owing to these uncertainties, which no precautions can entirely guard against, when it is essential that the limestone should be equally and thoroughly calcined, the kilns are worked on the intermittent system, the charge being put in at once, and the kiln allowed to cool down before the lime is removed, the extra cost in fuel being more than compensated for by the superior quality of the lime obtained.

In the chalk districts, in which what is termed "flare lime" is produced, to distinguish it from the lime as obtained from the kilns to which I have referred, the process is carried out in a somewhat different manner. Only a small quantity of fuel is mixed with the chalk, its calcination being chiefly effected by the flames of the burning coal placed below. A fireplace is constructed in the outer wall of the kiln of brick arches, these arches being continued within the kiln by piling up large blocks of chalk, over which the remainder of the chalk is filled in; the fire below the arches is lighted, and when the whole mass has attained the requisite temperature (which is determined by the experienced eye of the kilnsman), the fire is allowed to burn out, and the lime, when cold, is withdrawn. These kilns will turn out about thirty tons of lime with a consumption of about nine tons of coal. A variety of kilns have from time to time been proposed with the view of diminishing the consumption of coal, few of which have been constructed on sounder principles, or have been more successful in attaining the desired object, than those of Hoffmann, which are frequently alluded to under the name of circular or ring kilns.

The great economy, as regards fuel, effected by the use of kilns of this description is obtained by causing all the air entering the kiln to pass over the lime that has already been calcined before it reaches the burning fuel, and the products of combustion, together with the carbonic acid and vapour of water from the limestone, to pass over the fresh limestone before reaching the chimney. By the arrangement adopted, the air is raised to a high temperature before it reaches the fuel, by taking up the waste heat from the hot lime, which in ordinary kilns is entirely lost. Combustion takes place under the most favourable conditions, the fuel being consumed in the most perfect manner, with scarcely any escape of smoke. The heat recovered from the gases evolved is sufficient to raise a portion of the limestone almost to dull redness before it meets with the burning fuel, and the amount of heat that escapes is little more than what is required to create a sufficient draught in the chimney. The kiln consists of a flat-roofed circular or elliptical tunnel, divided into twelve or more chambers, placed round a central chimney shaft; the flues which connect each chamber with the central chimney are so arranged as to be capable of being closed at pleasure. Two adjoining chambers of this series are opened (generally every day), in one of which the operation of charging with fresh limestone is going on, whilst the lime is being taken from the other. The air entering at these open chambers passes through four chambers filled with hot lime, which it cools down, becoming more and more heated before it reaches the two or three chambers in which the fuel is being consumed, and afterwards passes through the remaining chambers of the series filled with fresh limestone, finally reaching the chimney through the flue of the last chamber that had been filled on the previous day. The fuel used is small coal, which is thrown in at the top of the flat roof of the kiln in very small quantities at a time, through openings communicating with shafts that are left to receive it when stacking the limestone. These openings are closed by loose covers that are only lifted at the moment when the coal is put in, or for the purpose of observing how the kiln is working. The kilns are constructed on a very large scale, each of the chambers, in a kiln which has now been worked for 20 years in North Wales, being capable of turning out 20 tons of lime. The building of such kilns involves a large outlay of capital, and it is necessary that they should be kept going constantly and regularly, as the kiln after having been once lighted is never allowed to go out, every chamber taking its turn for the operation of filling, firing, and discharging. It is evident under these circumstances that kilns of this description are most suitable for large works, and where there is a constant demand for the lime produced. Another description of kiln has recently been brought out for burning lime and cement, known as the Dietzsch kiln, which is still more economical as regards the consumption of fuel than Hoffmann's, inasmuch as there is less waste of heat, owing to the portion of the kiln in which calcination takes place never being allowed to cool except for repairs. This kiln consists of a vertical shaft, divided horizontally into two parts, which are connected together by a short horizontal chamber. The upper part of the shaft is kept charged with the raw material, which gradually falls by its own weight into the horizontal chamber, from which it is passed on as required, by means of shovels, to that part of the lower portion of the shaft in which its calcination is completed, and which is maintained at a high temperature, by the continual addition of fuel (in small quantities at a time), through apertures made for this purpose and for stoking. The calcined material is allowed to fall into a cooling chamber, through which air is supplied to the kiln. By this arrangement the cement or lime does not remain in contact with the fuel for a longer time than is necessary for its calcination, and no heat is wasted in having to warm up the walls of the kiln after every discharge. The air supplied to the kiln is warmed by passing over the calcined mass which it cools, whilst the gases produced by the combustion of the fuel give up the greater portion of their heat to the freshly charged material before escaping from the top of the shaft. It is stated that in a kiln of this description a ton of cement does not require more than from two to three cwt. of small coal for its calcination. The Dietzsch kiln has only quite recently been introduced into this country. Its construction is simple, but it requires more constant attention than ordinary kilns.

It has been proposed to use gas as the fuel for lime burning, a plan which has the advantage of not bringing the lime into contact with coal or coke, and consequently produces a lime of better colour. Although attempts have been made to adopt this process on a considerable scale, I am not aware of their having been brought to a successful issue in this country, owing to the difficulty that has been experienced in so regulating the supply of gas and air as to insure the ignition of the mixed gases taking place in such a manner as to produce a uniform temperature throughout the mass of limestone, and in making the kiln gas-tight. It may be anticipated that, with more experience, these difficulties will disappear, but at present the Hoffmann kiln for lime burning is entitled by long experience of its merits to be considered as one of the best, both as regards efficiency and economy.

When lime has not been properly calcined, and will not slake with water, it is termed "dead burnt," which may arise from two causes: from insufficient burning, when the limestone, instead of being entirely caustified, has only been changed into a basic carbonate consisting of two equivalents of lime and one of carbonic acid, one-half only of its carbonic acid having been expelled; this basic carbonate, on the addition of water, instead of forming a hydrate of lime, and being converted into a fine impalpable powder, attended with the production of a large amount of heat, is changed with but comparatively little elevation of temperature into a mixture of hydrate and carbonate.

In the case of hydraulic limes which contain a considerable amount of silica, this "dead burning" may arise from the limestone having been subjected to too high a temperature whereby a partial fusion of the silicate of lime formed has been produced, giving an impervious coating to the inner portions of the stone, which retards the further evolution of carbonic acid. On this account the eminently hydraulic limes require to be carefully calcined at as low a temperature as practicable, and hence we not unfrequently find that lias lime has been imperfectly calcined. Pure limes, if subjected to too high a temperature, exhibit somewhat less tendency to combine with water than is the case with lime that has been properly calcined.

Caustic lime units with water with great energy, so much so, as to evolve a very considerable amount of heat. When water is poured upon a piece of well-burnt pure lime heat is rapidly generated, and the lime breaks up with a hissing, crackling noise, the whole mass being converted in a short time into a soft impalpable powder known as "slaked lime;" chemically speaking, it is a hydrate of lime—that is, lime chemically combined with a definite amount of water. In the process that is termed slaking, one equivalent or combining proportion of lime unites with one equivalent of water, or in actual weight 28lb. of lime combine with 9lb. of water (being nearly in the proportion of 3 to 1) to form 37lb. of solid hydrate of lime; the water loses its liquid condition, and it is to this solidification of water that the heat developed during the process of slaking is partly due. In the conversion of a solid body into a liquid, as is the case in melting ice, a certain amount of sensible heat is rendered latent, and in reassuming the solid condition this amount of heat is again rendered sensible. In slaking lime, however, a much larger amount of heat is developed than is derived from the solidification of water, which further development of heat is to be ascribed to the chemical action which takes place between the water and the lime; for chemical combination, in by far the greater number of cases, is attended with evolution of heat. The heat thus generated may be perceptible to the senses or not, according to circumstances—thus, for instance, when carbonate of lime is decomposed by the addition of an acid the heat developed may not be observed, because a large proportion is absorbed in the conversion of the carbonic acid from the solid form in which it existed as carbonate of lime into a gaseous state.

The heat generated by slaking lime has been made use of as a perfectly safe means of obtaining coal in fiery mines without the

necessity for using gunpowder or any other explosive. A hole is bored in the seam of coal about 3ft. in length, and 2½in. in diameter, into which is inserted a perforated iron tube of about ½in. in diameter, covered with a strip of canvas in order to prevent the perforations being closed by particles of lime. The hole is then nearly filled by putting in a number of short cylinders of highly compressed lime in which a groove is left to receive the iron tube, the charge being completed by 6in. of well-rammed clay tamping; water is now forced down the iron tube, and in a few seconds the lime begins to swell, producing a quantity of steam under considerable pressure, which tends to crack the surrounding mass of coal. The temperature never exceeds 800deg. Fahr., so that in the most fiery mines there is never sufficient heat generated to give rise to an explosion.

The manner in which the process of slaking lime is conducted is a matter of considerable importance, because if this operation is imperfectly carried out, the plaster made from such lime will be liable to blister, owing to the subsequent slaking of small particles of lime still remaining in a caustic state, and these blisters will not unfrequently make their appearance after the lapse of a considerable time. All "rich" or "fat" limes (as those limes are termed which are obtained from pure limestones) may be slaked by mixing with a sufficient quantity of water to reduce the whole to a thick pulp, and are not in any way injured by remaining in this condition for a considerable period. In the preparation of plaster for fresco painting, it is customary to employ lime that has been kept for a long time in the state of thick paste, so as to secure the hydration of every particle; for it is well known that the smallest portion of unslaked lime would be fatal to the plaster as a suitable material for the ground of any decorative work of art.

With the eminently hydraulic limes, on the contrary, it is necessary to adopt a different mode of proceeding, inasmuch as it is requisite that care should be taken, in slaking limes of this description, that too large a quantity of water should not be employed.

The energy with which hydraulic limes combine with water is not nearly so great as is the case with pure limes, and if too much water be added, and the lime is flooded, the slight amount of heat generated is absorbed. If limes of this description be allowed to remain for any length of time in a pasty condition, hydrated silicates of lime and alumina begin to be formed, and if these silicates be disturbed and broken up, the power of the lime to set subsequently is diminished. In slaking hydraulic limes no more water should be used than is necessary to secure hydration. The slaking of such lime is carried out in practice by sprinkling water over a heap of lime, and covering it over with the sand that is intended to be mixed with it when converting it into mortar, the covering of sand serving to retain the heat that is developed, so as to enable the process of slaking to be carried out slowly throughout the mass.

By exposure to air caustic lime is slowly converted, without much elevation of temperature, into a coarse powder, consisting of a hydrate and carbonate of lime.

Mortar consists of a mixture of slaked lime and sand, in the condition of a thick paste, which is spread in thin layers between bricks or stone for the purpose of cementing them together; the effect of the sand is to increase the points of attachment, and to render the mortar open in its texture, hence it is that the more irregular and angular are the particles of sand the better is it adapted for the purposes of mortar-making. In mortar required for plastering it is necessary that the sand used should be free from salt, and that no brackish water should be employed, on account of its containing deliquescent salts, which have a great tendency to absorb moisture, and consequently to render the plaster always liable to become damp.

The hardening of mortar is due to several causes which act collectively. In mortar made from pure or rich limes the first setting is due simply to the evaporation of the water, and to the production of minute crystals of hydrate of lime; this hydrate then slowly absorbs carbonic acid from the air, the rapidity of this absorption necessarily decreasing in proportion to the difficulties presented to the free access of air. This being the case, it is manifest that pure limes are not suitable for mortar to be used for thick massive walls, or in places where it is likely to be exposed to the action of water. It is a well-established fact that, in very heavy masonry, mortar made from pure lime may remain for an almost indefinite period in its original soft condition. In the case of mortar made from hydraulic limes, it is necessary that the mixing of the mortar should be completed as rapidly as is compatible with the thorough incorporation of the materials, and that it should be used as soon as practicable after having been mixed, for if mortar of this description be put aside for any length of time, its setting properties are deteriorated.

The pure limes are undoubtedly the most effective when lime is required for disinfecting or sanitary purposes, as, weight for weight, they contain more lime than the hydraulic limes, but for the use of the builder there can be no question but that those which partake more or less of the character of hydraulic lime are most suitable; the mortar of such lime sets quicker and much harder than is the case with mortar made from the purer descriptions of lime. It is on this account that the grey Dorking lime made from the lower chalk is preferred for building purposes to that made from the upper chalk. Mortar for hydraulic purposes may also be made by mixing with the pure limes calcareous clays or shales, which have been so altered by the agency of heat that the silica they contain has to some extent assumed the condition of soluble silica. The mortar which was held in such high estimation by the Romans consisted of lime mixed with puzzuolana, so named from a small town at the foot of Mount Vesuvius, in the neighbourhood of which it was first obtained. It is also found in other localities which have been subjected to volcanic eruptions. This puzzuolana is an altered felspathic tufa, the silica of which has been so changed in its character as to be in a more or less soluble condition.

Trass is a material similar in its character to puzzuolana, obtained from the pits of extinct volcanoes in the valleys of the Rhine, between Mayence and Cologne, as well as in various parts of Holland. It is held in high reputation by Dutch engineers, the name trass being derived from a Dutch word signifying a binding or adhesive substance.

There is a great want of uniformity in the chemical composition of these volcanic products, which necessarily gives rise to uncertainty in the composition and character of the supplies obtained, and their use is now to a great extent superseded by the substitution of hydraulic lime or cement.

IMPROVED HOUSE-BUILDING IN BUENOS AYRES.*

THERE are few parts of the world where the science of architecture is more necessary, and certainly none where it so little exists as in this rapidly-increasing city of ours, euphoniously and appropriately called Buenos Ayres. By reason of the very inferior materials at hand, proper artistic, effective, useful, and sound work is all but impossible to the ordinary workman. By art in architecture I mean professional skill in the disposition of rooms and staircases, heights of floors, ventilation and sanitation, not ornamental stucco-work, with pilasters and columns, standing out and carrying nothing, and balconies, pediments, and parapets of apparently crushing weight, but of no use or beauty whatever. The iniquities that have been and are perpetrated by uncultured constructors, unqualified draughtsmen, and *soi disant* architects go a very long way towards hindering the advancement and civilisation of a nation which, of all the junior countries of the earth, is at the present time the most promising and prosperous. A stranger, on first catching sight of the prison-barred houses, finds it hard to understand how such obsolete vestiges of a barbarous age can find favour in the capital of so progressive a nation as the Argentine Republic—the London of South America, the New York of the Southern hemisphere. I am told, whilst hundreds of young men are yearly taking to the profession of law and physic, none ever turn their attention to architecture. It is made too much of a trade, a commercial business. *Constructor arquitecto*, and *ingeniero* appear to be regarded as synonymous terms, whereas they bear but little real affinity or relation one to the other. Hitherto, all the labour and honours of the architectural profession have fallen to the lot of a few foreigners, amongst whom I am proud to recognise more than one fellow-countryman standing out in the first rank, shoulder to shoulder with Germans, French, and Italians. I fear that they have but very few native-born apprentices in their offices, and it is to this circumstance that the study of architecture proper, both from an artistic and scientific point of view, is suffering and will continue to suffer. In England, on the contrary, every architect's office is overcrowded with articled pupils, and the profession is so overstocked that competition has, for many years past, been both keen and disastrous. In this country youths are crowded into Government offices where there is little or nothing to do, and where the temptations to go wrong are so great that the most promising boys succumb, and the industrious youths become lazy and indolent. Considerable improvement has taken place in the architecture of Buenos Ayres since the beginning of the century, when General Whitelock's army attacked the city, every house of which, by reason of its low and flat roof, became a veritable fortress. At that period, possibly, there could not be found a single *alto* house in the whole city, and Sarmiento tells us that so recently as 1850 there were not a dozen houses boasting of two stories, the principal one being in the centre of the *manzana* where the old Bolsa now stands. The first alto houses of any importance were *La Vireyna Vieja* in Calle Peru, and the *Altos de Escalada* at the corner of Victoria and Defensa—a very grand edifice, doubtless, in its own day, but a frightful eyesore as it at present stands. Then came the *Recoba vieja*, which disappeared in one night under the magic stroke of Senor Alvear's wand. I would that he had swept away that ill-named *Casa de Justicia* as well, or, at least, the Clock Tower. From this period until the Mitre administration, 1862—1868, little or no advancement was made in architecture, whatever may have been the progress of the nation in other respects. But for the Paraguayan war, much more advancement would have been made both in public and private enterprise. The birth of the Argentine Republic, properly so called, dates from the battle of Pavon, where the old *caudillo* system received a death-blow. The large buildings erected for the Provincial and Hypothecary banks mark the Sarmiento period, as stand out the palatial State schools like monuments to General Roca. In like manner, I hope, the new Capitol, Law Courts, Immigrants' Hotel, &c., are destined to speak to future generations in favour of the present administration. Rivadavia first decreed the rounding off of the corners at the *boca-calles*, but it is only of late years that this salutary statute has been enforced, it having remained a dead letter during close on to half a century. Whilst on the subject of street corners, I should like to say a few words regarding the width of the most central and fashionable streets, which are during certain hours of the day most inconveniently crowded. Why not oblige house-owners to set back their buildings three yards or more from the boundary lines of their property on the *veredas?* And furthermore, why should not the Municipality expropriate narrow strips of land through each square, so as to form narrow lanes or approaches to the rear of the houses or buildings? By this arrangement all nuisances such as coals, *basura*, boxes, &c., can be avoided at all the principal entrances, and servants and tradesmen will be provided with entrances of their own. This plan has been successfully adopted in the principal European capitals, and there is no reason why it should not be done here. As we all know, land has lately risen tremendously in value, but I think we shall presently see a reaction set in. Whether it does or not, the population of this city is increasing so enormously, the central part must of necessity be very expensive, and economy must be exercised in covering the land to be built upon. How is this to be done? Simply by sinking basements and building *altos*. The setting back of the buildings will give more light and air, and, architecturally, the aspect of the streets will be much more pleasing.

* Portions of a paper read before the English Literary Society of Buenos Ayres by FRANK E. THICKE, architect, June 23, 1887.

Dr. Crespo, the new Intendente, has increased the limit of the height of buildings by two mètres—thus, instead of 14 mètres we may erect a facade 16 mètres high to the top of the cornice. Mr. Duggan's fine house in Calle Piedad, Dr. Rocha's fine mansion (the architecture of which I am not prepared to criticise) in Calle Lavalle, are notable instances of the advantages of setting back from the side-walk. Mr. Peter Gartland in Calle Florida was the first to employ solid blocks of granite, a plan worthy of consideration, by reason of the abundance of this splendid material to be found in the South of this province, and which, while a thousand times more durable than bricks, is more easily cut and moulded than marble. The "house-famine" has been, and still is, a matter that has not escaped the notice of capitalists and speculators, but the subject has bothered and puzzled them in more ways than one. The exceedingly high price of land has been the chief obstacle to a definite and satisfactory solution of a very difficult question. Even in the remote and out-lying quarters of the city it is hard to find a house for a small family under 80 dollars per month, or three times the rent of a house 18 months ago. If we take the depreciation of currency into account, the rents are still exorbitant and very much higher than in Europe. Taking this into account, and also the very high price of eatables and drinkables, it would appear on the face of it that all of us above the position of peones or servants are living much beyond our means. Time alone can prove whether this is so or not. As the *Buenos Ayres Herald* a fortnight since said that while "in 1886 there were not far from 4,000 building permits taken out, which would indicate housing accommodation for, say, 40,000 persons, but some of these were reconstructions, it may safely be said that the new buildings just about provided for the new comers. We are paying not less than double the price of house rents in the most progressive of cities in the United States, and from three to four times as much as one would pay for equal accommodation in a European city of the size of Buenos Ayres." In 1842 there were only 42 houses built in Buenos Ayres. In 1853 there were 500, and ever since then the number has increased, and two-storied houses began to present themselves pretty frequently. In Mr. Mulhall's statistics of 1884, he tells us that the annual value of houses built in Buenos Ayres is £720,000, as against London £15,300,000, New York £5,600,000, and Montevideo £230,000. But I will now endeavour to deal with the professional part of my theme. Professor Ruskin, who, as everybody knows, is an art-critic, a genius, and an eccentric one, very beautifully says of architecture: "It is the manly language of a people inspired by resolute and common purpose, and rendering resolute and common fidelity to the legible laws of an undoubted God." Good architecture is the work of good and thinking men. A nation's prosperity and progress are judged by its architecture. It is, therefore, manifestly to the interest of us all to pause once in a while and consider the position of affairs in connection with an art and a science which are so truly identified with our physical and moral well-being. The rise and progress of domestic house-building is a subject which should be discussed in this city above all others at the present time with great and impartial deliberation. Undoubtedly a new era is setting in, and a social revolution is impending, which will distract the attention of the native from the extravagantly large and lofty rooms, and over-górgeously decorated entrance halls and salas, and divert his thoughts to the more practical considerations of economy in space and improved sanitary arrangements. The increasing facilities for visiting Europe have had a very beneficial effect upon the minds of those who have, during the past few years, journeyed to London, Paris, Berlin, and Vienna, and many have returned imbued with improved ideas of domestic physical existence which have permeated through the strata of their own spheres with considerable advantage to themselves directly and indirectly to the community at large. The first thought of the designer of a house after taking the general instructions of the proprietor should be: How can I combine stability, utility, and beauty in the building which may become an ever-present monument to my skill, or an ever-standing stigma to my discredit as a professional man? An architect who has a conscience and is properly trained knows perfectly well that no defect is more glaring or more unpleasant than want of proportion. He is taught that by harmony is meant the general balancing of the several parts of a design, and he has learnt that due attention to harmony and proportion gives the appearance of stability and repose which are indispensable in a fine building. After this comes the very important matter of ornament, a subject that to-night must be very lightly touched upon. I may remark *en passant* that colour in architectural embellishment should be regarded as a subsidiary element, and I may moreover hint to you, even in this city of stucco, that it is very doubtful how far external colouring of an artificial character is desirable. Shams are ever to be deprecated, and I loathe and detest those who suffer the exteriors of their dwelling-houses to be daubed over with various outlandish tints which represent in no degree any *natural* materials such as architects or builders of this or any other age have ever witnessed. The time has not arrived as yet when the architect can indulge his fancies in variegated brickwork; but the English-cut bricks which are now being made at San Isidro point to a not very remote future when proper brick houses will be possible without the aid of stucco. When this time arrives and a little more attention is paid to tiles and slate-roofing we shall see springing up all around the suburbs, and, indeed, in the city itself, specimens of Gothic and Queen Anne architecture which will relieve the monotony of the square, flat-roofed, box-like edifices with plastered fronts which abound everywhere and are such terrible eyesores to artistic minds. Far be it from me to criticise too harshly the *plan* of the ordinary native house; but, in justice to my subject, I must allude to the very glaring defects which they possess—defects, in most instances, admitted by the natives themselves. We will take for instance a private residence or dwelling-house, whatever you may call it—in Calle Santa Fé, where so much building is now being carried on (I am sorry to say mostly in the same old style), costing from 15,000 to 18,000 nacionales. You have an entrance in the centre leading to a patio; on either side of this a large room with windows to the street, and what we call at home a French casement-window at the rear opening into the patio. To get from one of these rooms to the other, access can only be had through the exposed patio. These two rooms have behind them three, four, or five other rooms, used as bedrooms, as the case may be, all leading out of one another, and with simply either one or two French casements for the purposes of light and so-called ventilation. Then comes the *comedor* and the kitchen, right away at the rear of the square plot of land upon which the building is erected. Now, it is obvious to the meanest capacity, that in the event of one of these intermediate rooms being occupied by a sick person, or being rendered impassable in any other way, the only way to get to the comedor or kitchen is through the open patio, be the weather what it may. Hereby have been sown the seeds of consumption and other diseases, owing to this fatal arrangement. Another defect patent to a stranger is the absence of proper "wholly inclosed" entrance halls, where callers can wait and hats and overcoats can be left. Cupboards, store-closets, linen rooms, larders, and other appurtenances so dear to the English housewife, are generally conspicuous by their absence. At all times and at all seasons the servants have to trudge through possibly three patios to get to the front door, even if they hear the door-knocker, which is so far off, and bells are so very scarce. In many houses the "door-windows" have no fanlights, so that on a hot summer's night, if ventilation is to be obtained, one of the casements must be opened down to the ground, thereby admitting any rats, dogs, or cats that may be prowling about in the patio, and decidedly destroying the privacy of the bed-chamber. Light, "God's eldest daughter," is a principal beauty in a building; but it does not shine alike from all parts of the heavens. An east window gives the infant beams of the sun before they have strength to do harm. In a west window the sun grows low, and the day seems longer in the room in which it is placed. Through lights are best for rooms of entertainment, and windows on one side only for dormitories. The private buildings in a town are often beset with difficulties which do not occur to those in the country, where the extent of site is freer and ampler. These, consequently, can be isolated and receive light from every side. Their offices may be separated from the main building and the parts may be disposed in the simplest possible manner; but in cities the site is generally more or less restricted, often very irregular in form, and usually bounded by party walls. Yet, with all these obstacles, it is necessary to provide almost as many conveniences as are required in a country house. All that can be done is to make it as much so as the nature of the spot will permit, and to produce the maximum of comfort which the site can be made to afford. Nothing should be beneath the attention of the accomplished architect, nor anything above his powers. He ought as cheerfully to undertake the meanest cottage as the most magnificent palace. A poor man's dwelling in town should consist at least of a sitting-room and a bedroom; a w.c., sink, and lavatory distinct and not far removed from his rooms; a washhouse and scullery with the means of drying clothes in any weather without artificial heat, and, when practicable, a playground for his children. These requirements can only be arranged for on the barrack system which in London has now become so popular, not only for the poorer classes but also for the middle and upper classes. The necessary economy of space in the over-crowded parts of this city, renders it urgent that something should be done in the way of sinking *sotanos* and erecting *altos*. You all know that in England the general mode of building the average middle-class town house is to construct a kitchen in a floor below the ground and a room behind serving for a variety of purposes—an area in front with vaults under the pavement, and the same in the rear. The space opposite the descending staircase forms a cupboard—wine-cellars, larder, &c., are provided for the vaults. On the ground-floor there is rarely more than a passage on one side which conducts to a staircase, and this requiring more width than the passage itself; the best room on this floor is placed in the front, and the back is a smaller room, often opening on a small light closet still further in the rear. A yard is supposed to be behind by which light is obtained for the back-room. On the first or other floors the passage becomes unnecessary; the drawing-room or front upstairs room therefore runs over it, and becomes larger, while the back rooms follow the form of those on the ground floor. Though little variety may be the result to which this sort of house is usually confined, the addition of 4ft. or 5ft. either way will enable an architect to throw in closets and other conveniences. If this style of house is successful in other cities, why should it not be adopted here? It is only a question of time for this plan to be carried out, *necessitas non habet leges*, and it must come to it if any return at all is to be made for the investment of capital. The English word home, it is a curious fact, is an untranslatable one. It has no actual equivalent in any other country, and look in what foreign dictionary you may you will not find it. We English pride ourselves upon our homes, which we call our castles, where we are safe from intruders, where we shake off all business matters or thoughts, and where we indulge in that congenial, loving domesticity, which has made England's sons and daughters what they are and what they are determined they will continue to be. A North American lady has recently paid a charming tribute to English homes. She says: "There is a room in every English house which immediately declares itself as home. Everything declares itself to be a part of the home and the family. Going into such a room the first feeling is the sense of harmony, then the atmosphere of many minds and much culture. There is the chair for papa from which he reads the evening paper and hears his daughter's music; old family portraits are on the walls, and everywhere there are visible the touches of hands familiar with the legends and meanings of the room," &c., &c. The English community in the city of Buenos Ayres do not appear to have built private residences to the extent that might have been expected of them in order that they might make their homes more on the

true old English lines. This may be accounted for by the fact that the majority of them are mere birds of passage, paying periodical visits to the mother country, and never intending to end their days in so far-off a land. Nevertheless, it is a surprising fact, although in various parts of the camp there are many estancia houses which can compete with many a well-designed English country house. Of these the house of Messrs. Kincaid Bros., on the North bank of the Rio Negro, deserves honourable mention. It is a piece of Scotland transplanted and flourishing in the midst of the Patagonian desert. The introduction of hard wood into the construction of houses in this country has apparently, as far as my knowledge goes, not yet been tried, otherwise than in doors and window frames. I think it might prove to be very successful, and have induced the directorate of a new hotel which I am erecting at Mar del Plata to try the experiment. In a flat even country, like the greater portion of this province at least, it behoves us to assist nature by erecting buildings which are picturesque and attractive, and in a seaside place especially we want something more than the mighty ocean to make a *coup d'œil*. Promenades, terraces, public gardens, and other public places may, and probably do, go some way towards making a district pleasing and attractive; but so long as the square, stucco, box-like one-story houses are permitted to be erected, so long will any district remain an eyesore to the artistic mind, be it in city, suburb, country town, or seaside watering-place. When Senor Alvear, our great Lord Mayor, proposed the grand central Boulevard, so simple and so useful, *La Prensa* only backed him in a lukewarm, half-hearted manner, whilst other city journals, edited by Argentines, openly attacked this most excellent measure. The boulevard is a public necessity, and must be made sooner or later—the sooner the better—but it should be made by the people and for the people. All properties improved by the work should be expropriated at their actual value to be resold by public auction in the act of opening the grand thoroughfare. In this way this great health-giving and beautifying work would be realised without costing a cent of public money. Honeycombed as this city is with *pozos*, it is satisfactory to know that in the city itself the water supply from the *aguas corrientes* is abundant, and as satisfactory as can be reasonably expected under a municipality which, as has been recently demonstrated, is not the most perfect in this hemisphere. It is many years since sheepskin men went their matutinal rounds on foot or horseback, their stock-in-trade (water) being contained in bags of raw hide for lack of barrels or tin cans. Many of you here to-night may remember the ante-umbrella epoch, as it is called, when long, snake-headed pipes, projecting from the roof tops across the narrow *veredas*, or sidewalks, carried the storm-water away from the roofs, thus allowing pedestrians to pass along unmolested and perfectly dry. Next came the barrel system, and then the *algibes*. Surface draining has certainly been studied in various parts of this city, and the deluges and petty Niagara Falls are not so common as they were. Not longer ago than 1869 I read of men and horses being swept away, pianos, sofas, and other articles of furniture floating down the most fashionable thoroughfares. Thirty thousand pounds would scarcely cover the loss by the floods on one memorable day. As recently as 1871 peones carried people across the best paved streets on their backs after a heavy fall of rain, and English ladies went to a ball, at the quinta of a leading physician, in a bullock cart! Tramways have done more for this city than for perhaps any other city in the world, and that is saying a good deal. One thing is certain, that trams first began to run here in 1870, and in an incredibly short space of time changed the whole system of life, architecture among the rest benefiting by the reaction. What would the suburbs of Flores and Belgrano be now without the tramways! Many of you must remember when it was a day's journey to visit either Belgrano or Flores. And when the underground railway comes, and it will come sooner or later, what scope will there be for the local speculative builder, and what fortunes will be made on the lands which the line will open up. Time has not permitted me to say all I have in my mind regarding house-building in Buenos Ayres, but I hope that within the next few months you will be enabled to see some of my original drawings and designs carried out in their integrity, and they will, I hope, convey to your minds what my ideas are upon the subject. I have endeavoured to show you that there is imperative need for improvement in house-building in this city, and I have tried to make you believe that it is not so difficult to attain all those domestic home comforts in this far-off land that we have been accustomed to in the old country. Economy of space, and a more detailed investigation into matters generally, both materially, artistically, and sanitarily, on the part of proprietors, are the only cures for evils which, if neglected, will only increase and multiply. The members of this society, many of whom have come more or less recently from the priceless comforts of happy English homes, should not be above studying house-building, both artistically and practically, for though it may not at first bring them actual profit in the shape of dollars, physically and morally, they will not only be helping themselves, but also benefiting their fellow citizens.

THE INSTITUTION OF CIVIL ENGINEERS.

THE council invite original communications on a variety of subjects of professional interest. For approved papers premiums, arising out of special funds bequeathed for the purpose, are awarded—viz., from the Telford fund, which produces £260 annually; the Manby donation, of the value of about £10 a year; the Miller fund, for students' papers, realising £150 per annum; besides a Miller scholarship of £40 each year and tenable for three years; and the Howard bequest of nearly £16 a year, awarded every five years, commencing from 1877. Among the suggested subjects of papers are the following:—Tacheometry, or Rapid Surveying; the distinguishing qualities of Clay to make good Puddle; Colonial Woods suitable for Engineering Purposes; the influence of Sea-Water upon Portland-Cement Mortar and Concrete; Wind-Pressure upon Structures; the Working-Strength of Iron and Steel as affected by (1) the amplitude, (2) the frequency, and (3) the time-rate of the stress-variations; the Effect of Different Qualities of Water on the Condition and Duration of Cast-iron Pipes; Recent Improvements in Cable Tramways; the Present Position of the Manufacture of Steel—its Defects, and Suggestions for its Improvement; the Distribution of Electricity for the Lighting of Towns; and Electricity for Working Street Tramways. In writing these essays the use of the first person should be avoided. They should be legibly transcribed on foolscap paper, on one side only. Every paper must be prefaced by an abstract of its contents not exceeding 1,500 words in length. Illustrations, when necessary, should be drawn on tracing-paper, to as small a scale as is consistent with distinctness, but in no case should any figure exceeed 6½in. in height. The communications must be forwarded to the secretary of the institution, from whom any further information may be obtained. There is no specified date for the delivery of MSS. Among the premiums awarded for the Session 1886-87, were the following:—The Howard Quinquennial prize to John Percy, M.D., F.R.S., in recognition of his researches on the uses and properties of iron. For papers read and discussed at the ordinary meetings:—a Telford medal and a Telford premium to Alexander Blackie William Kennedy, F.R.S., M.Inst.C.E., for his paper on "The Use and and Equipment of Engineering Laboratories"; A Telford premium to William Joseph Dibdin, F.C.S., F.I.C., for his paper on "Sewage-Sludge and its Disposal"; a Telford premium to William Santo Crimp, Assoc.M.Inst.C.E., for his paper on "Filter-Presses for the Treatment of Sewage-Sludge"; a Telford premium to John James Webster, M.Inst.C.E., for his paper on "Dredging Operations and Appliances"; and the Manby premium to Lewis Henry Ransome, Stud.Inst.C.E., for his paper on "The Conversion of Timber by Circular-saws and by Band-saws in the United States." For papers printed in the proceedings without being discussed: A Telford Medal and a Telford premium to John George Gamble, M.A., M.Inst.C.E., for his paper on "Water Supply in the Cape Colony," and Telford premiums to Joseph Hetherington, for his paper "On Utilising Waste Air in Filter-Pressing; with some Results of Pressing Sewage Sludge at Chiswick," and to Killingworth William Hedges, M.Inst.C.E., for his paper on "Central-Station Electric Lighting."

GRANITE QUARRIES OF CHESTER COUNTY, PENN.

THE *Proceedings* of the Engineers' Club of Philadelphia recently contained an account of the "Granite Quarries of Chester County, Penn.," by Mr. J. H. Harden. Chester County has become noted for its syenite, and three companies are engaged in working the quarries. This granite is a beautiful grey syenite, of fine grain, uniform in colour, free from iron or mica, and capable of splitting in any direction. The Pennsylvania Granite Company, who are developing the quarries in one part, are engaged in cutting the boulders into paving blocks dimension stone. Some of the boulders are of immense size, and from any of the quarries the largest sized stone required for architectural purposes can be obtained. Dr. Charles M. Cresson, in a report on the granite, remarks that the stone is a syenite of fine and even texture, the component quartz being less in amount and in much smaller masses than in the Quincy granite, which is also a syenite. The French Creek stone, worked by the French Creek Granite Company, is said to weigh about 191lb. to the cubic foot, the Quincy granite weighing 167lb. The French Creek stone is also said to be inferior in weight to the Slaten Island Granite, used so largely for paving at New York. The report observes that, owing to the finer grain of the French Creek stone, in addition to greater density, it possesses greater toughness and resistance to wear than the Quincy stone. Trials upon imperfectly-prepared cubes of the former stone show that a force of over 23,700lb. on each square inch, or over 1,500 tons on each square foot, was necessary to crush them; whereas, according to Trautwine, the alternate crushing load for granites is stated at 300 to 1,200 tons per square foot. It is said also that the French Creek stone resists atmospheric influences fully as well as the Quincy granite. The waste stone makes excellent macadamising material. Chester County, according to Mr. Harden, is likely to become a great quarry for paving blocks and cut granite, and there is room for other quarries.

EFFECTS OF TEMPERATURE ON IRON BRIDGES.

THE influence of temperature on iron is of vital importance in the construction of iron bridges. It has been observed by Mr. Edwin Clark that "half an hour's sunshine has a much greater effect on the tubes of the Britannia Tubular Bridge than the heaviest trains or the greatest storm; they are, in fact, in a state of perpetual motion." Mr. Graham Smith, in a paper read at Liverpool in 1877, made some useful remarks, which may be usefully quoted here. He referred to the strains caused by the variation of temperatures. "If the difference between the extremes of temperature be assumed at 82° Fahr., or, say, between 20° above zero and 102° Fahr., and a change of 15° be capable of inducing a strain of one ton per square inch on wrought iron, it follows that this variation of temperature, unless provided for, will induce a strain of 5·5 tons per square inch; but this is a somewhat extreme supposition for this reason: such extremes are never coexistent in any 24 hours, because the cold ten degrees of frost is of necessity only present in winter, and then the temperature in the sun might be taken at 40° Fahr., or a difference in any winter's day of but 18°, or a strain of little more than a ton." Mr. Smith thinks an allowance of 7-16in. in every 100ft. is sufficient in this country. The strain caused by expansion has been calculated, unless provision is made, to be about 3½ tons to the square inch. The Meteorological Department furnishes the most exact data obtainable as regards the maximum range of temperature in England, from which it appears that the maximum difference possible

at the same instant between any two parts of a structure is 51° F. Mr. Edwin Clark, speaking of the Britannia Bridge, says: "An increase of temperature of 26° F., from 32° to 58°, gives an increase in length of 3¼in. on the wholebridge. The expansion is thus one-eighth of an inch for each degree, or 1-1450th part of the whole length. It sometimes bends 2½in. laterally and 2½in. vertically when the sun shines on one side or on top of the tube. A heavy train deflects the tube only 3-10in." In a straight girder the resistance to friction on the supports does much, to prevent the free expansion and contraction of the beam; this is usually lessened by the introduction of rollers. The resistance of rolling friction varies directly as the weight resting on the roller or half the whole weight of girder, and inversely as the radius of roller. In order to enable the girder to move freely it ought to be built with a certain camber, so that the horizontal thrust would be in equilibrium with the resistance of friction, and any change of temperature would cause the guide to move freely in the direction of its length. When the resistance of friction is not so balanced by the thrust due to camber there is a danger of the girder twisting or bending. It would be easy to show graphically these forces; but it may suffice to say that for rollers 1ft. in diameter and 100ft. span the versed sine of the camber is calculated at 1·85ft.; the smaller the diameter of the rollers the greater the camber.

TESTS OF PORTLAND CEMENT.

IN obtaining reliable results certain tests are necessary in the use of Portland cement. Weight per bushel is not always to be relied on, unless the cement is fed through a standard hopper into a measure of standard size. One authority, Mr. D. L. Collins, gives rules for this weighing, and a drawing of a hopper. Fine grinding is of more importance, and it makes great difference to the weight, as may be observed by passing the best cement freshly ground through an 80-mesh sieve, and leaving certain percentages of residue. All cement increases in bulk and weighs less with age. Fineness of grinding is one of the safest tests. For engineering works the per cent. residue left should be under 10 through a sieve with 2,500 meshes, and for special work the same residue through a sieve of 6,400 meshes. Speaking of the water test, Mr. Collins says it is one of the safest guards as to the soundness of cement; and recommends that thin cakes should be made up and placed upon pieces of glass or other non-absorbent material, and then, when thoroughly set, one cake should be immersed in water, the other being kept in the air. Before immersion, the cakes may sometimes require 24 hours to become set. If after this the cakes show cracks in the outer edge, the cement should not be passed unless it can be proved that the defect is due only to freshness of grinding, and can, therefore, be thoroughly remedied by air slacking. A glass test-tube filled with gauged cement is a good test; if the tube cracks in two or three days, the cement is good; if the expansion bursts the glass to pieces, it is inferior. Many clerks of works use the test-tube, and on all works where good cement is required it ought to be tested in this manner.

Christ Church, Carlisle, was reopened on Sunday week, after partial renovation. The old three-decker pulpit, reading desk, and clerk's desk have been removed from the chancel, and the higher level of the chancel floor has been extended. The new pulpit is of polished pitch pine with mahogany panels. The seating has been renewed and rearranged, and a system of hot-water pipes has been laid down. The reredos has been redecorated, and the walls painted throughout. Mr. Court carried out all the joiner work, and also prepared the plans for the work just completed; Messrs. J. and J. Wharton supplied and laid the heating apparatus; Mr. Miles Newton did the mason work; and the painting and decorating were done by Mr. Hannah.

General Hutchinson, on behalf of the Board of Trade, officially inspected on Aug. 25th the new tramway from Haslingden to Accrington, and expressed his approval. It was opened for public traffic on Saturday. There is now tramway communication from Haslingden to Blackburn, a distance of nine miles.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Cambrian Archæological Association.—The concluding meetings of this association took place on Friday and Saturday. On the former day excursions were made from Denbigh, the rendezvous of the association, to St. Asaph, where the visitors were received by the Dean and conducted over the cathedral. Visits were paid to Bodelwydden Church, built at a cost of £60,000 by Lady Willoughby de Broke, in memory of her husband; St. Mary's Well, Vaynor Manor House, and Trefynant Church. An excursion was made to Cefn Caves, where human and animal remains of great antiquity have been found. The annual association gatherings terminated in the evening with a public meeting at Denbigh, under the presidency of Lieutenant-Colonel Mainwaring, at which notes on Rhuddlan Priory were given by the Venerable Archdeacon Montgomery, and a paper on Welsh parish records was read by the Rev. Elias Owen, M.A. On Saturday, the members inspected the museum got together by the local secretary, Major R. Lloyd Williams; the 400 exhibits included the charters, plate, and regalia belonging to the town council of Denbigh, ancient manuscripts, and historical portraits.

Glasgow Institute of Architects.—On Thursday the annual excursion of this institute took place, the destination being Dunblane and Doune. The party numbered about 20, and on arriving at Dunblane at 10.40, were received at the Cathedral by the Rev. Mr. Ritchie, minister of the parish, and Dr. R. Rowand Anderson, of Edinburgh, architect to the proposed restoration. Among others present there were—Mr. David Thomson, president of the institute; Mr. John Honeyman, past-president; Mr. T. L. Watson, treasurer; and Mr. Thomas Turnbull, of Wellington, New Zealand, at present on a visit to Europe. Mr. David Robertson, the president of the Institute of Measurers; and Mr. A. Lindsay Miller, secretary of the Architectural Section of the Philosophical Society, and other guests were also present. Dr. Anderson conducted the party to the choir, where he recounted what was known or surmised of the history of the Cathedral. In the adjoining aisle he exhibited some old illustrations and his own drawings of the building, and described some of the proposed restorations, dwelling particularly on points of great obscurity and difficulty with which he had been encountered. On these he invited suggestions of members. The party then spent some hours in examination of the structure and in consideration of some of the points of difficulty. Dr. Anderson does not intend to renovate or restore the wasted or defaced architectural members. His restoration is to be confined to the rebuilding of the parts actually ruinous, with a new roof and floor and the glazing of the windows. The walls and pillars of the building were originally covered with a thin coating of plaster, which was afterwards decorated. No attempt will be made to restore this. The broken and wasted mouldings and carvings are not to be touched. Satisfaction was expressed by the visitors that the renovation was not to include the effacement of the present character of the building, as has occurred in so many other cathedrals and churches. We illustrated the present appearance of the Cathedral by an elevation and details of the west front in the Building News for May 20, 1870, and the nave arcade on Oct. 14 of the same year, both being drawings in the "Sketch-Book Series" afterwards published separately; the west front was shown in a sketch by Mr. W. Ferguson, of Glasgow, on Dec. 13, 1878; and perspectives of the exterior and interior, from drawings by Mr. J. B. Tyerman in our issue of July 24, 1885. The party then visited the ruins of the Episcopal Palace, and a call was afterwards made at Archbishop Leighton's Library, where some of the more curious of the old volumes were examined. In the afternoon train was taken for Doune, where the castle was visited. Mr. Dunbar, the custodian, conducted the party over the building, which is one of the largest and best preserved of the castles of Scotland. Noon was spent in examining the numerous fine apartments of the building, and in tracing the remains of outworks. In the evening dinner was served in an hotel, when Mr. David Thomson, the president, occupied the chair, and Mr. T. L. Watson, the vice-chair. The President afterwards wrote to the clerk to the heritors of Dunblane, saying:—"I am asked to express the great satisfaction of the members that the Cathedral restoration is to be carried out in such a conservative manner as Dr. Anderson's explanation showed. They are of opinion that the effect will be to preserve the structure, and that as the existing work is not to be touched, except where necessary for its preservation, the historical and architectural interest attaching to the building will not be impaired."

Society of Architects.—A special general meeting of the Society of Architects will be held at the society's new rooms, St. James's Hall, Piccadilly, on Tuesday week, the 13th inst., at 7 p.m., when votes will be taken on the advisability of changing the title to "The Society of Architects," and upon other matters of general business, including the balloting for thirty-one gentlemen who have been nominated for membership. It is in contemplation for the members of the society to visit York and neighbourhood during the first week in October. Gentlemen intending to join the party can apply for tickets to Mr. G. A. T. Middleton before September 13th. Tickets for friends may be obtained, admitting to the visits and *conversazione*, price 7s. 6d. each. The following is a sketch programme drafted by the York Architectural Association:—

Monday.—Gentlemen from the South travel down by the 10 a.m. train from King's Cross. 3.30 p.m.—Reception and Conducted Walk round York. 7.30 p.m.—Discussion: 'The Architects and Engineers Bill."

Tuesday.—Visit: Kirkstall Abbey and Adel Church. Train leaves York for Leeds at 9.10 a.m. 7.30 p.m.—Discussion: "Yorkshire Building Stones."

Wednesday.—Visit: Ripon and Fountains Abbey. Train leaves York at 10.15 a.m. 7.30 p.m.—Discussion: "Yorkshire Architectural Art."

Thursday.—Visit: Beverley, Hedon and Hull. Train leaves York at 6.45 a.m. 7.30 p.m.—Discussion: "Professional Charges."

Friday.—9.0 a.m. Visit: St. Mary's Abbey, York.—11.0 a.m. Visit: York Minster and Minster Library.—3.30 p.m. Visit: Heslington Hall.—7.30 p.m.—Conversazione of the York Architectural Association, to which all members of the society visiting York are invited.

CHIPS.

The second meeting of the Cumberland and Westmoreland Antiquarian and Archæological Society for this season will be held on Tuesday and Wednesday, the 13th and 14th inst., when the members and their friends will meet at Ulverston. During the first day Swarthmoor Hall, Birkrigg, Aldingham, Gleaston, and Urswick will be visited; and on the second day, Marsh Grange, Kirkby, Ireleth, Coniston Hall, Lowick Hall, and Hawkswell.

Mr. Charles Waring, of the firm of Waring Brothers, railway contractors, died on Friday at Wycombe Abbey, Bucks, of which he was tenant during the absence of Lord Carington in Australia. Mr. Waring was, from 1865 to 1868, M.P. for Poole.

Mr. Samuel Fielding, of Todmorden, has purchased a building in Dock-street, Fleetwood, hitherto known as the Whitworth Institute, and has offered it to the town for the purposes of a free library. The ratepayers have adopted the Free Libraries Acts, and the building will be formally presented to the town by Mrs. Fielden on Saturday, the 10th inst. The name of the Institute will be altered to the Fielden Free Library and Newsroom, and the new promenade, which is also to be opened on the 10th, will be designated the Fielden Promenade.

By an extensive fire which occurred on Friday in Messrs. Cumming and Smith's furniture factory, North Wallace-street, St. Rollox, Glasgow, damage was caused to the extent of about £6,800, being £5,000 to stock and £1,803 to buildings. Besides the stock, a large quantity of workmen's tools and machinery used in the business has been completely destroyed. Messrs. Cumming and Smith were both occupiers and proprietors of the premises.

St. Joseph's Roman Catholic Church, in Grosvenor-street, Liverpool, was reopened on Sunday after having been internally decorated by Messrs. Jelley and Co., of Slater-street, in that city.

Mrs. Lough has just made a valuable supplementary gift of statuary and models by her late husband to the corporation of Newcastle-on-Tyne. The most important of those works are "Milton Invoking the Muses," "Hercules," a marble statue of Algernon, fifth Duke of Northumberland, a marble bust of the mother of the sculptor, and one of the first Baroness Rothschild, and models of the four Apostles and four of the Prophets.

SEVILLE CATHEDRAL. — ANTIQUES FROM THE LOUVRE.—RESIDENCE AT WESTCOMBE PARK, BLACKHEATH. — LONG'S HOTEL, BOND-STREET.—INITIALS FROM THE LETTERS OF CLAUDIUS TOLOMEUS.—ST. CHARLES'S HOME, BULLINGHAM, NEAR HEREFORD.

OUR LITHOGRAPHIC ILLUSTRATIONS.

SEVILLE CATHEDRAL.

Of the numerous interesting architectural monuments of Spain, perhaps the Cathedral at Seville may claim the first place, as it is certainly one of the largest and finest; the solemn, or "grandeza," is its distinctive quality, as elegance is of Leon, strength of Santiago, and wealth of Toledo. The original mosque, on the form of which it is built, was erected by Abu Yusuf Jacob-al-Mausur in 1172, and continued to be used as a cathedral until 1401, when it was pulled down. The new cathedral was begun in 1403 and finished in 1506; but the cupola fell down the following year, and the work of reconstructing it was not completed until 1519. The name of the architect is not known; whoever he was, he worked with no thought of self, but for the sole love and glory of God. The cathedral at the present time is in course of restoration under the superintendence of Senor Cassanova. The plan of the building is an oblong, being 414ft. long by 271ft. wide; it consists of five aisles, the two lateral being railed off to form chapels. The nave is magnificent, its height being 150ft., while the dome of the cupola rises to 170ft. The cathedral is lighted by ninety-three windows, some of them being filled with the finest stained glass in the country. The view given is looking up the nave towards the coro to the high altar. The coro is open to the high altar, and is railed off by a fine wrought-gilt reja, the upper part of which is seen; it is the work of Sancho Munoz, 1519; the marble screen, from pier to pier, shutting off the coro from the rest of the nave, is a most beautiful piece of Spanish Renaissance by Bartolomé Morel. The cathedral and its numerous chapels are museums of fine art and curiosities, possessing some of the finest pictures in Spain. GILBERT S. DOUGHTY.

ANTIQUES FROM THE LOUVRE.

This sheet of sculpture represents three of the best groups of Roman statuary to be seen in the great collection of the Louvre. Nero, whose name is the synonym for cruelty and vice, will for ever be associated with works of depravity and brutality. He was the son of Caius Domitius Ænobarbus and Agrippina, the daughter of Germanicus, and was named Nero Claudius Momitius Cæsar. His nightly pleasures were taken frequently in the meanest taverns, and the different scenes of his excesses were found among the vilest characters. Resolved on imitating the burning of Troy, he caused Rome to be set on fire in different places, and during the conflagration, which lasted for nine days, he enjoyed the terrible scene; placing himself on the top of a tower, he sang of the destruction of Troy, accompanying himself with his lyre. He put his mother to death and murdered his wife, Octavia (whom he married when he was only 16 years of age), in order that he might wed his mistress, Poppæa Sabina, the wife of Otho. The odium of Rome's destruction was thrown upon the Christians, and in consequence many were put to cruel deaths. After several unsuccessful conspiracies against him, Nero terminated his own life in the year 68 A.D., in the thirty-second year of his age, after a reign of 13 years and eight months. Wretch though he was, it is said that he had some few to mourn for him, and Suetonius records that some unseen hand had placed flowers on his tomb. Byron thus alludes to this incident at the end of the third Canto of "Don Juan":—

> "When Nero perish'd by the justest doom,
> Which ever the destroyer yet destroy'd,
> Amidst the roar of liberated Rome,
> Of nations freed, and the world overjoy'd,"
>
> "Some hands unseen strew'd flowers upon his tomb—
> Perhaps the weakness of a heart not void
> Of feeling for some kindness done when power
> Had left the wretch an uncorrupted hour."

In brilliant contrast to the dire deeds of Nero stand the records of Trajan's clemency. This Roman Emperor was born at Ithaca. His services to the empire recommended him to the notice of the Emperor Nerva, who adopted him as his son and invested him with the purple. The actions of M. Ulpius Crinitus Trajanus were those of a truly benevolent prince. He died in Cilicia in August, A.D. 117, in his sixty-fourth year, and his ashes were taken to Rome and deposited under a stately column which he had erected in his forum to commemmorate his victory over the Dacians. It is 125ft. in height, and is ascended by 185 steps. Upon the summit was originally a statue of Trajan, but Pope Sixtus V. substituted that of St. Peter when he repaired the column in 1589, and placed a figure of St. Paul over the Antonine Column, which was executed in imitation of the column of Trajan. The celebrated hero Hercules, also illustrated here to-day, ranked as a god after his death. According to the ancients, there were many persons of the same name, but the son of Jupiter and Alcmena, generally called the Theban, is the most distinguished, and his birth was attended with many miraculous events. Before he was eight years old, Juno sent two snakes to devour him, which he seized and crushed to pieces. "The Twelve Labours" which he achieved comprised the slaughter of the Nemæan lion; the destruction of the Lemæan hydra; the catching of the stag with golden horns and remarkable for his swiftness; the seizing alive a wild boar which committed great ravages; the cleansing of the stables of Augias; the killing of the carnivorous birds near Lake Stymphalis; the taking captive a prodigious wild bull; the obtaining the mares of Diomedes, which fed on human flesh; the getting possession of the girdle of the Queen of the Amazons; the destruction of the monster Geryon; the obtaining the apples from the Garden of the Hesperides, and the bringing to the earth the three-headed dog Cerberus. He delivered Dejanira from the Centaur Nessus, whom he killed. The Centaur as he expired gave Dejanira a mystic tunic, which in a jealous paroxysm she gave to Hercules to put on; this he had no sooner done than he was seized with a desperate distemper which was incurable. He erected a burning pile on Mount Æta, on which he cast himself. Jupiter surrounded the burning pile with smoke, amidst which Hercules, after his mortal parts were consumed, was carried to heaven in a chariot drawn by four horses. In the group which we illustrate to-day we see Hercules with the infant Telephus in the palm of his hand. The legend of Telephus, son of Ange, an Arcadian princess, who, while acting as priestess of Athené, was subjected to the violent wooing of Hercules. This unhappy woman exposed her infant on the mountains of Arcadia, where it was suckled by a hind. Mother and child were soon found by Hercules and saved from destruction. The story of Telephus is portrayed on the frieze of the great altar at Pergamon.

RESIDENCE AT WESTCOMBE PARK, BLACKHEATH.

This residence has lately been erected from the designs of Messrs. Higgs and Rudkin, architects, the builder being Mr. H. L. Holloway, of New Cross and Deptford. The building is of red brick, with red terracotta window dressings, hanging tiles, half-timber work, and Broseley tile roof. The entrance hall is 31ft. by 25ft., with a panelled dado and handsome oak staircase and arcading. The house is lighted throughout by electric light.

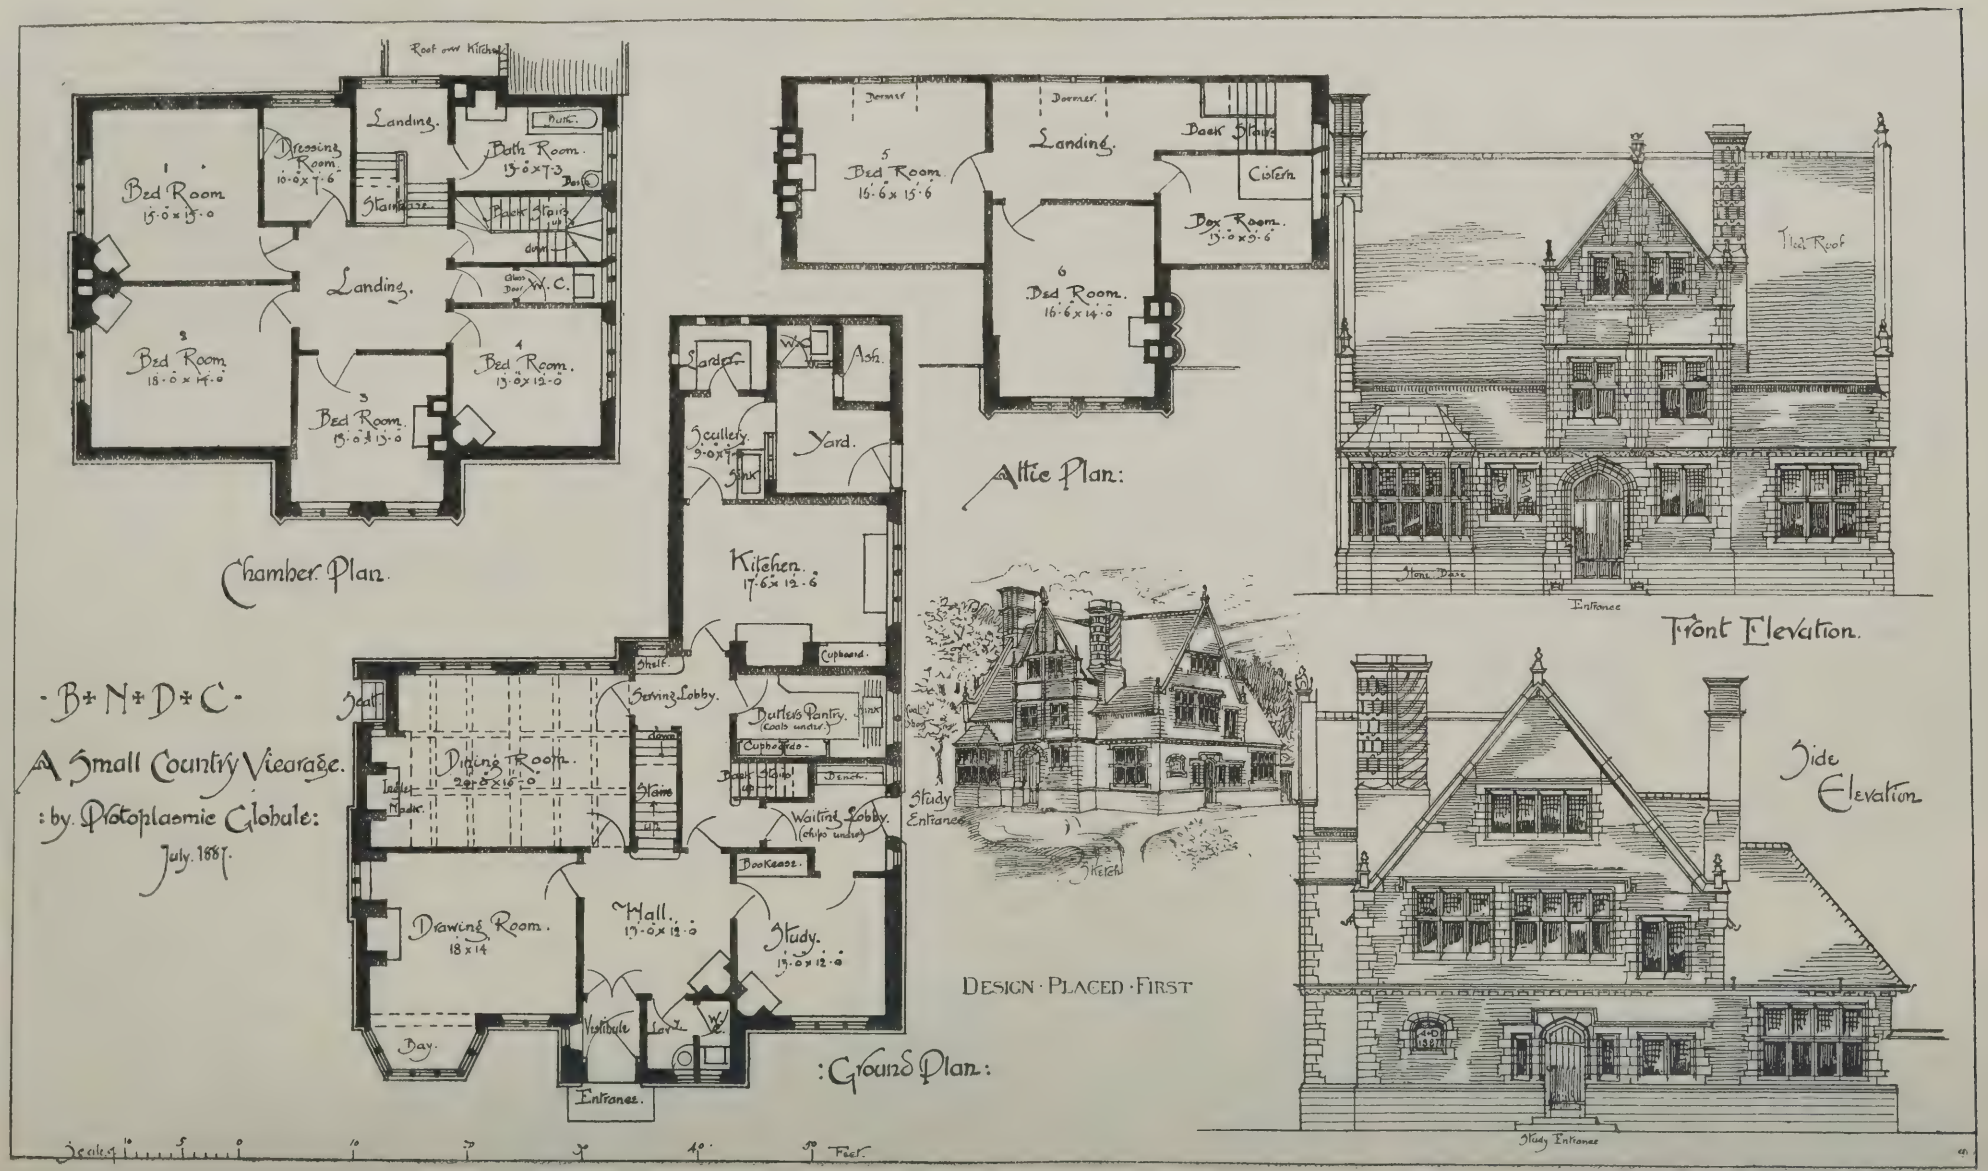
LONG'S HOTEL, BOND STREET.

This old and important hotel will be very shortly rebuilt on its present site, and with the additional site of No. 13, Clifford-street. The important and commanding character of the intended new building will be seen from the drawing. The hotel will be constructed on the best and most modern principles of drainage and sanitation, in respect of which especial attention will be given. The kitchen departments will be in white glazed bricks. Coffee, reading, smoking, and billiard rooms, with their adjuncts, will be on the ground floor. The upper floors will be specially arranged as sitting, bed, dressing, and bath rooms. The hotel will be provided with a visitors' lift to the several floors, and the hotel generally will be lighted by electricity, with a supplementary system of gas lighting. The work of rebuilding has already been commenced, so as to insure completion by the ensuing season. Mr. William G. Bartleet, F.R.I.B.A., of 2, New Broad-street, E.C., is the architect.

INITIALS FROM THE "LETTERS OF C. TOLOMEUS."

The admirers of Tolomeus, in or about the year 1547, collected many of his letters and caused them to be published, to the number of over 400, in a substantial quarto, by G. Giolito, the famous printer of Venice. Each epistle begins with a fine initial letter, and it greatly taxed the ingenuity of the printer to provide the necessary supply of woodcut capitals. The volume in question contains some three or four distinct series of such letters; prominent among them are a set representing games or sports—thus: A, cards; B, dice; E, jumping; G, ninepins; and V, tipcat. We have selected some of the best of this set of letters in the sheet of woodcuts we have reproduced in facsimile. A few letters of the same character belonging to other series have been included, the subjects in some cases being rather obscure, but the designs are mainly Biblical or mythological. Strange to say, the works of Tolomeus are less sought after by 19th-century collectors for their intrinsic literary merit than they are for these numerous initial letters, and the book has been so ruthlessly cut to pieces on this latter account that it is actually "scarce." What a sad fate for an author after over 300 years! There are sixty different letters in the entire volume.

ST. CHARLES'S HOME, BULLINGHAM.



St. Charles's Home, just erected at Bullingham, near Hereford, was built by Mrs. Delabarre Bodenham, of Rotherwas, and is intended for a home for old people on Rotherwas Estate. The materials used in the construction are the local red brick, with dressings of Bromsgrove stone, which harmonise well with the brick. All the external woodwork is of oak. The roofs are covered with local tiles. The cost has been a little over £1,000. Mr. T. Taylor, of Hereford, was the contractor; and the architects were Messrs. Pugin and Pugin, of London.

The foundation stone of a new Wesleyan lecture hall and class rooms was laid in Dilston-road, Newcastle-on-Tyne, on the 24th ult. Mr. J. W. Taylor, of Westgate-road, Newcastle, is the architect, and the building, which is Late Gothic in style, and built of local stone, will accommodate 400 persons, at a cost for erection of £1,300. Mr. Joseph Elliott, of North Shields and Newcastle, is the builder.

The death is announced, at the age of 70 years, of Mr. John Palliser, C.M.G., F.R.G.S., by whom the international boundary line between British North America and the United States was topographically determined across the main chain of the Rocky Mountains, and thence to the Pacific Coast, in 1857-60.

A Local Government Board inquiry was held at Andover on Wednesday week before Major Hector Tulloch, with respect to an application from the town council for sanction to borrow £1,000 for paving purposes. The inspector said he should report favourably on the application.

The new bridge over the Medway, between Rochester and Strood, which is being reconstructed for the South-Eastern Railway Company, in connection with their extension to Chatham, is rapidly approaching completion. Messrs. Cochrane and Co., of London, are the contractors.

"BUILDING NEWS" DESIGNING CLUB.

SUBJECT R.—A COUNTRY VICARAGE.

WE have no doubt whatever as to the superior merit of the design for a country vicarage contributed by "Loidis," considered only in respect to its architectural treatment; but with equal certainty the plan by "Protoplasmic Globule" is in most points preferable to it, and in house building, particularly in vicarages, where the occupiers cannot select their own houses as the laity can, a good plan necessarily is of primary importance. The elevations of "Protoplasmic's" design are tasteful and quiet in style, with little really to find fault with, though he cannot in this case claim either much originality or any particular home-like character for his building. The point which governs the plan of such a house is the position of the study, with its waiting lobby and separate external entrance. This has been fairly well provided for in this design, and the parish people calling on their clergyman are isolated from the body of the house; and, moreover, which is of great importance, they do not pass any of the reception rooms or the front door, thus leaving the privacy of the dwelling unimpaired, both outside as well as in. The hall is square and light, while the two parlours are well planned, save that the door of the dining-room would have been better placed facing that of the study. At present it crowds upon the dining-room entrance. The staircase ought not to face the front door, and the stairs seem more pinched on the ground plan than they would be in reality. The kitchen is of a proper size; but the other offices are needlessly crowded. The ingle nook window in the dining-room should command an outlook, but as here shown it peeps only into a garden-seat recess. The ornamental chimney stalk adjoining the entrance gable is rather too big in drawing in the perspective. "Loidis" fails, as we have already said, with his plan, but he takes the second place, most assuredly, and we commend his elevations for their pleasing grouping and good proportions. As both these designs are illustrated herewith, our readers can at once follow the rightness of our award. The hall is somewhat similar to the last; but the study is so contrived that every person coming to see the vicar officially must go in front of the drawing-room windows, command a view of the verandah leading from the dining-room, and look right into the study itself; while the projecting bay window, pretty feature that it is, quite shuts off all view of the study door from anyone approaching the house. This the perspective sketch will show. The corridor between the kitchen and the dining-room is awkward, and so are the stairs for convenient service from the kitchen, which indeed is itself much too small for adequate service. The back stairs are badly placed, and effectually spoil the bedroom over the kitchen by rendering the connecting corridor necessary. In other respects the first-floor plan will pass muster, but the bath-room is too publicly situated, and the w.c. ought to have a lobby to it, and should not open off the staircase. "Norseman" sends a rambling plan, very disconnected in its exterior treatment; nearing, in fact, positive ugliness as seen in the perspective. The pastor's study is well isolated from the house, and the ground-floor lavatory and w.c. arrangement is good; but the waiting-room, thus thrust to the front of the house, suggests too much the idea of a public relief office or tax collector's office rather than the entrance to the sanctum of a spiritual adviser or confidential friend. The big windows of the houses beyond seem to indicate worldly grandeur and opulence, and thus they serve to mark unnecessarily the mean commonplaceness of the "study door" already noted. The dining-room and drawing-room are convenient, and the servery connecting the kitchen with the former is well placed, though it would be rather dark. The first floor is, generally speaking, well planned, subject to the remark that the w.c. and bath arrangements would bear considerable improvement. After "Norseman's" design comes that sent in by "Truth," who seems to have studied somewhat lightly the designs of the late E. W. Godwin. There is a crudeness also in his plan, but it realises the needs of a parsonage better than many others, while the study and its separate entrance are practically considered. The staircase has all the look of being dark, in spite of the words "window over" written by the wall of the linen closet; and, besides, the servery under the staircase would be in complete darkness. The exterior of the house, though high-shouldered in effect, would look rather well, and it has an air of quaintness worthy of note amidst so many uninteresting designs. "Iota" has merits in this contribution of his to the club, and his plan shows thought and study of detail, which is duly noted. The w.c. at the end of a long corridor leading off the main landing is, however, an instance of sheer carelessness — nothing could be worse. The exterior of this design is over-windowed, and no elevation is given of the entrance front. In the view, the garden entrance, with its over-depressed archway, looks too important. "Iota," with a little more experience, should rank higher in the contests yet to be inaugurated by our club. "Aspirant" knows how to work well, but not too wisely. There are numerous excrescences in his plan and windows, of all shapes and sizes, which need trimming. Here, too, is instanced another example of how not to plan a priest's study. The waiting-room to it is made too much of without really being convenient. The elevations are creditably drawn. "Omega" comes last among the designs of the first order of merit. Had his drawings been a little more refined he would have commanded a higher place, seeing that his plan is in some respects a very good one. The study entrance is too prominently treated, however, and the huge landing on the first floor is wasteful in the extreme. An isolated dressing room is little better than a dress closet, although in the elevations it may be marked, as here, by an important gable.

"Try Again" takes rank among the best designs of the second class in the competition. His plan evinces a sense of size and compactness which we have not overlooked. His waiting-room for callers on the pastor is situated in juxtaposition with the scullery, and forms, in fact, the only way between the kitchen and that necessary apartment. The back staircase leads also out of it. Such a series of conveniences for the parish caitiff or easily-tempted thief cannot be considered desirable, and spoils the other advantages of this plan as well as the elevation, which it illustrates; thus, we may with advantage repeat the author's motto and tell him to "Try again." "Elean" sends an unfinished drawing of a design not up to his usual standard either in plan or architecture. "Alley N." makes his study doorway compete with the principal entrance, and so visitors would find great difficulty in judging which archway might lead to the front door. In the perspective view both seem to lead to each other with a cloister between them. The plan itself is better, and without being distinguished by any originality of a special kind may be described as decidedly convenient. The sketch illustrating "Ierne's" design rather spoils its effects, but after allowing any merits which the elevations possess we find the plan both poor and disjointed, lacking a central point of interest and all air of comfort. The party wall, dividing as it were the house in two, may account for this failure. "A Student" sends a plan which suggests that its author with a more lengthened study will do better, for there are decided merits in his arrangements of plan. The study and its own door have clearly proved too much for him, and whichever way you approach the house the relative positions of the front door and this subsidiary one seem wrong. The principal entrance is out of sight round the corner in the sketch given. "En Avant" has a quaint elevation for his vicarage; but the view here also spoils it. The dining-room, with its two bays, is rather too pretentious, and the hall would be dark and ugly. The main idea of a clergyman's home is rather lost sight of.

Of plans in the third series of merit we have to enumerate "Vitruvius," with a top-lighted stair (?); "Lost," with a wonderful portico finished with a barge board, though his arrangement for the study by the side of the house realises far better than many other plans what a clergyman needs in the way of a waiting-room and separate doorway for his parishioners; "Rab" attempts a bird's-eye perspective, but evidently it is only a trial task. Another time the results may be better; at present the effect is very bad. His study and waiting-room are very good, and the author is anyhow a practical man, who, with a well-directed inquiry into the requirements of good planning, will avoid the crude features which now spoil his composition. Architecturally, he has clearly much to learn. Last in our list ranks "Stag," who, in case his building should be mistaken for, perhaps, the booking-office of a country railway-station, carves on a circular panel over the front door an inscription which he who rides may read "The Vicarage." We make this remark in all kindness, for the author fails entirely to suggest a gentleman's home by the design submitted, with its round tower and conical roof over it. On plan, this feature forms a circular study—a most inconvenient arrangement—while the flag on top of the roof is quite out of character. Nothing could be more awkward, too, than the angle porch forming a waiting-room for the visitors to the circular study.

SUBJECT S.—A CRICKET PAVILION.

"Protoplasmic Globule" wins the first place again for this subject, "Northumberland" coming second, and there being only one other competitor, "Lawton" comes third. The selected design we shall illustrate in due course, when the details of its ingenuity of planning will be understood better than by a verbal description here. The second best plan has a capital ladies' gallery and some good dressing-rooms. The committee are well isolated, and the players' terrace adjoins their room. Externally the design, too, though cramped in effect, is suitable. "Lawton's" design is more of the regulation type of building, and fails from its want of interest.

CHIPS.

A new hotel, erected on the site of the Duke's Head Inn at Skinburness, on the Cumberland coast of the Solway Firth, has just been opened. Mr. Ferguson, of Carlisle, was the architect, and Mr. E. H. Banks the builder.

The late Henry Cox Wilkinson, late of Enfield, has bequeathed bronze heads of Pope Clement VII. and Pope Sixtus V. to his wife for life, and then to the Science and Art Department, South Kensington.

The tower of Bradninch Church, Devon, which was struck by lightning in December last, has just been repaired by Mr. John Glover, of that village, under the superintendence of Messrs. Hayward and Son, of Exeter, from whose designs the general fabric is about to be restored.

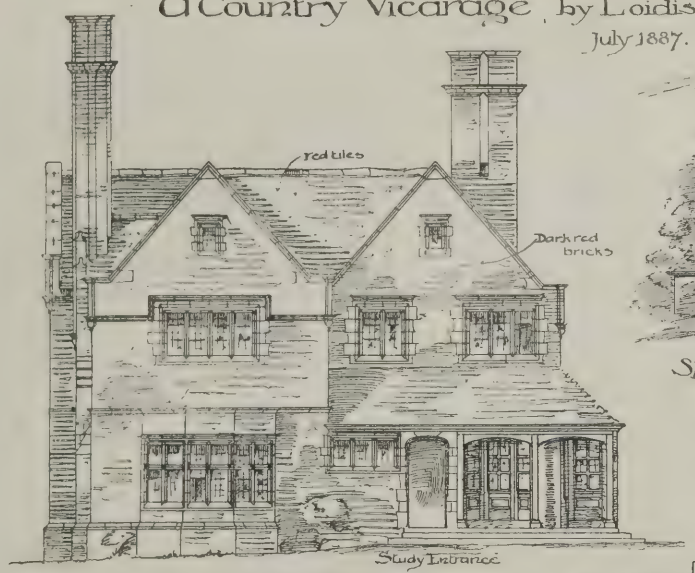
The Wolverhampton board of guardians have decided to build new workhouse schools for 200 children at Wednesfield at an estimated cost of £12,000.

The People's Opera House at Stockport was burnt down on Friday. It was built for use as a temperance hall, and had recently been enlarged and rendered otherwise more suitable for music-hall purposes.

A commencement was made last week in the demolition of buildings in West Tower-street, Carlisle, preparatory to the erection of new markets from plans by Mr. Cawston, of London. Messrs. Hodgson, of Workington, are the chief contractors.

The parish church of Seamer, near Scarborough, is about to be restored at an estimated outlay of £2,400. The pews are to be repewed by open seats, and new roof to nave, new pulpit and other fittings provided.

A memorial chapel is to be added to St. Jude's Church, Southsea, in memory of Sir Owen and Lady Lanyon. It is to be adorned with mosaics, and two monuments—one to Sir Owen and the other to Lady Lanyon—will be placed in it.



The new technical institute, Keighley, will be opened on Friday, October 14, by the Worshipful the Master of the Clothworkers' Company. Lord Rosebery and Professor Huxley will also take part in the opening proceedings.

The restoration of the parish church of Hayton, near Brampton, Cumberland, was commenced on Monday. Mr. T. Taylor Scott, of Carlisle, is the architect.

The statue of General Gordon for Aberdeen, by Mr. T. S. Burnett, A.R.S.A., was cast in bronze on Friday, by Mr. Walker, at the Grove-street Foundry, Edinburgh, in the presence of the artist and a number of friends. The statue, which is 9ft. in height., will be taken out of the moulds about a week hence, and it should be ready shortly thereafter to be placed on its pedestal in front of the new Art School Buildings in the Granite City.

WAYSIDE NOTES.

LITTLE that is of vital importance seems to have occupied the attention of the architectural topical world during the last two weeks or so. Holiday-making appears to be the chief theme of those who have been, or are going, away. The "big gooseberry season" of the architectural year may be said to have commenced with the closing of the R.I.B.A. on the 31st ult. Since my return from Brittany I have learnt that the A.A., or a portion of that body, have had a very enjoyable excursion in the West of England; that many societies and associations interested in archæological matters have also organised holiday excursions combining instruction with pleasure; and that individual members of the profession, from the most august personages down to the gentleman who grinds up the Indian ink, have been, and now are, travelling far and wide in the cause of architecture. With new ideas and the mind stored with fresh forms and scenes, we almost forget that the parish of St. Martin's-in-the-Fields possesses a church with a very self-asserting portico, or that there was ever a competition for an Imperial Institute.

From the church of St. Martin's-in-the-Fields, the tide of discussion seems to have turned turned towards St. Mary-le-Strand. This "dangerous structure" (!) has now the honour of being the subject of a spirited correspondence in the *Times*. Alarm as to the condition of the edifice would appear to be of periodical occurrence. Fifteen or sixteen years ago, when the interior of the church was refitted under the direction of Mr. R. J. Withers, there must have been fears as to the safety of portions of the stonework, as at the time several vases were taken down from the parapet of the west front, and never replaced. Considerable friction existed between the rector and churchwardens when these improvements were effected, so much so that the latter individuals would have nothing to do with the rector's architect, but actually employed a "common stonemason" to "tinker-up" the exterior and remove the aforesaid vases. This was about 1871 Anno Domini. In 1878, as we may all learn from letters to the daily papers, the church was again overhauled, and the remaining vases received some attention. But now, in 1887, there is considerable danger of their disappearing altogether.

I have seen a curious old print of the church, which must have been published soon after it was built, as the figures represented are all in the quaint costume of the period, and there is a regular Sedan chair being carried in the roadway. The perspective of this picture is quite wonderful; but otherwise it is not a bad representation of the building when it was complete to a vase. One rather strange feature of this print is that over the semicircular western porch is shown a statue. This must either have been removed, or else, as is more probable, it only existed in the imagination of the artist.

There are no new competitions announced that are of any note, if we except the scheme for the proposed new Parliament House at Buenos Ayres. Invitations are, I believe, to be issued to architects of all countries to compete for this building. If, as is stated, the premiums are to be two in number of £8,000 and £2,000 respectively, they are uncommonly liberal towards architects in the Argentine Republic; so much so that one is inclined to think there must be a mistake somewhere of a cypher at the end of both amounts. There is a rumour of another large building being required in foreign parts—viz., an Imperial Institute for New South Wales; but it is probable that even if there be any competition for the work, it will not affect British architects.

The result of the Scarborough Club, and of the Stockport Technical School, competitions must be considered satisfactory, if we judge by the fact that no local men have obtained premiums. True, this circumstance does not *always* warrant fair-play; but in nine cases out of ten it indicates an honest decision. Disappointed competitors, however, can generally show us things in a different light. According to these gentlemen, there never was, nor will ever be, a fair award.

The eleventh hour has now come for those who contemplate entering the Gloucester Baths Competition. It is worth the attention of men who have the time to spare and a sound knowledge of bath construction and the details of their fittings.

And, according to all accounts, there are many with spare time on their hands just at present. The amounts in the lists of tenders, too, have been latterly rather modest. It is really astonishing that an architect will advertise his own weakness by publishing lists of tenders not even out of their teens. What possible good can it do a man to let the world know he has been commissioned to erect a pigeon-house in his neighbour's back garden? Yet we have tenders often published which are about as important. We may expect something like the following some day:—

BEDFORD PARK.—For the erection of a Queen Anne dust-bin for Mr. ———. Mr. T. Square, F.R.I.B.A., architect. No quantities supplied:—

Mr. Bungler*	£55 15 7
Messrs. Arrant Swindler and Co. ...	15 10 0
Messrs. Fairplay...	7 0 0
Mr. Romantique†	4 10 0
Mr. Careless**	1 10 0

* Withdrawn—error in cast. ** Withdrawn. † Accepted—subject to modifications.

It may possibly be of some little interest to the reader to know whither I wandered after leaving Caen. There was much to see at this latter place, but chiefly of an ecclesiastical nature. So numerous, in fact, are the churches of Caen, that there are, at least, two now abandoned—one near the Abbaye aux Dames, which is shut up altogether, and the other at the opposite end of the town is now used as a cart-shed, and is full of carpenters' and joiners' rubbish. From Caen to Bayeux, Bayeux to St. Lo, and St. Lo to Coutances, I journeyed to Avranches, on the borders of Brittany. All the above towns are full of magnificent architectural remains. At Bayeux, too, anyone fond of a joke in earnest should visit the world-renowned tapestry, as the figures are most quaint, and infinitely more ludicrous than anyone could have made them if they had tried to do so purposely. At St. Lo there is a very fine cathedral, with a unique external pulpit of beautiful design. On the west front of the building the reader will recollect there is some exquisite Flamboyant work, that is represented in "The Seven Lamps of Architecture." The whole west front of St. Lo is very beautiful and delightfully unrestored. The mosses and lichens on the old stones are of quite a golden tint, and grasses and other plants flourish in the nooks and crannies of the carvings. At Coutances there is a fine cathedral and two interesting churches. I inquired somewhat more deeply than usual into the internal economy of this cathedral, wandering about the roofs and vaults of nave, aisles, transept, and lantern. When I left Coutances and arrived at Avranches, and had climbed to the citadel-like town and stood upon the terrace in the beautiful public gardens, I was reminded of Sir Charles Eastlake's picture of "Pilgrims in sight of Rome." For there before me I beheld what was in many senses the object of my pilgrimage.

I have made several attempts to "draft" a description of this distant view of Mont St. Michael from the terrace at Avranches, but have failed to produce anything satisfactory, so will not attempt it now. It is really a most magnificent sight, and I had the pleasure of beholding it both in the glow of sunset and the grey light of early morning. Subsequently, I visited the wonderful Mont, and after seeing the strangely interesting town of Dol, and the height near known as Mont Dol, left for home viâ St. Malo. Of the marvellous beauties of Mont St. Michael I have not now time to write. It is, in fact, almost impossible to adequately describe its glories, either of form or colour, its architecture or its natural beauty, it wondrous mass or wealth of detail. The architecture of Mont St. Michael has almost the appearance of a spontaneous growth, as from the wave-washed masses of granite at the base of the rock there is a regular scale of gradation in point of elaborateness till we reach the bristling pinnacles that crown its summit.

GOTH.

THE ADMIRALTY AND WAR OFFICE COMMITTEE'S REPORT.

THE report of the Select Committee on the Admiralty and War Office sites, containing the proceedings and minutes of evidence which has been published in the form of Blue Book, narrates in official language the history of this important public competition with which our readers are now pretty familiar; and we may refer to it again in the light of the evidence which has now been published. On the 4th of March of the present year a select committee was appointed to reconsider the plans and proposals for an Admiralty and War Office, who were further instructed to inquire whether some or all of the existing buildings of the Admiralty might not be retained with advantage; this committee, in fact, was appointed in place of the one nominated in 1885 for the same purpose, but which never met, owing to the resignation of the Government. We may say that Messrs. Leeming and Leeming, the successful competitors for the new buildings, had received instructions to proceed with the plans of the basement portion of their design, and had made considerable progress with them when the Select Committee of the House of Commons was appointed to re-consider the plans. The report from which we take these facts observes that "it is on all sides admitted that Messrs. Leeming and Leeming ably carried out the task assigned to them, and their plans have received high commendation from distinguished architects; while, on the other hand, objections have been taken, and strong feelings have been expressed against the whole scheme." No committee could say more in vindication of Messrs. Leemings' designs, while the evidence published furnishes to our minds conclusive reasons why a grand whole, and not a piecemeal structure should be adopted. Since the idea of reducing the expenditure and making an extension to the existing Admiralty buildings has been entertained, we have hesitated to believe that any successful extension of the old buildings, commonplace and cramped as they are, can be made, though we must confess that the plan and elevation of the proposed additions to that building as prepared by Messrs. Leeming, at the suggestion of the committee, and illustrated in plates 4 and 5 of the Report, show a dignified extension of the old structure towards the Park at the rear. They are designed in a plain style, harmonising with the solid though bare 18th-century building which now does service in Whitehall. In plan this proposal consists in adding a right-angle block of buildings to the rear of the old Park front of the Admiralty, in such a manner that the Park front of the old structure will form one of three sides, inclosing a quadrangle 198 feet square in Admiralty-gardens. On the south side of the inclosure, opposite the Parade, will be a screen of Doric columns, something like that before the Admiralty. The new façade parallel to the screen, and forming the main block, is proposed to have a slightly projecting centre, pedimented, surmounted by a low dome and adorned by attached columns of the Ionic order. This will form the entrance. The end of the return new block is similarly treated with engaged columns and pediment and flat domical roof, and the corresponding side, forming the present end of the Admiralty block facing the Parade, will be also marked by a similar arrangement; but the present Park façade of this block is very plain, and will be left much as it is. The internal façades will thus present an entrance block facing the Parade, relieved by columns and central dome and two plain return fronts, one of which is the present Park front of the Admiralty. The rusticated basements at the end and the palladomical treatment proposed harmonise with the old buildings and Parade elevation of the Horse Guards.

But let us briefly refer to the proceedings of the Committee. It consisted of the following members:—Sir William Harcourt, Lord George Hamilton, Mr. Henry H. Fowler, Mr. Jackson, Mr. Sclater Booth, Mr. Shaw-Lefevre, Colonel Malcolm, Mr. Howell, Mr. Dillwyn, Mr. Ed. Hardcastle, Mr. William Bright, Mr. Seagar Hunt, Sir William Crossman, Mr. Patrick Joseph Power, Mr. Byrne, and Mr. David Plunket. Many interesting fac

re referred to in the minutes of evidence with gard to the site, the old Admiralty buildings, ie designs by Messrs. Leeming, and the em-loyment of those gentlemen. The evidence of ie Right Hon. G. Shaw-Lefevre forms a very nportant contribution. The old Admiralty, he uly observes, has always been considered poor taste; while the front portico is in bad propor-on. He observes, "With regard to its frontage the Park, it is an interesting old building no great artistic merit, but one which, apart om other considerations, one would be rather ad to retain." Yet nobody had thought of taining the existing buildings or had said uch in its favour. The Surveyor of the ffice of Works, Mr. Taylor, had found that ie foundations were "bad and insecure; so nch so that it would be impossible to add to ie building by adding another story; the cond-floor rooms are low, the attic story ot suitable for official purposes, and the nitary arrangements are imperfect." Mr. aw-Lefevre affirms that if the building to ntain the whole of the Admiralty officials ould cost £320,000, and if the present building ere retained, which will only house one-fifth them, the saving would be only £65,000. ill, a War Office site would have to be found. n the other hand, a portion of the Spring ardens site would be left, which is worth 266,000, after allowing for a roadway to ckingham Palace. Referring to the com-tition, in which Messrs. Leeming's design as placed first, Mr. Shaw-Lefevre, when ked whether he thought that the competi-on was a fair representation of the architec-ral talent of the country, plainly answers: was. He was the only person who knew the mes of the 128 who competed, as it ll to his duty to open the envelopes with the mes, in order that the plans might be re-rned. We cannot here quote the replies in ll; but the tenor of them is that Messrs. emings' design was certainly the best, and as also unanimously selected by the judges. essrs. Leeming have, despite certain remarks d criticisms, proved themselves equal to the casion: the evidence adduced by Mr. W. Bright convincing on this point, and both Mr. ristian and Mr. Hardwick, the professional lges, have reported that the Government re fully justified in employing those gen-men as architects. Upon this, instructions re given to them to commence working wings, and they naturally looked upon their pointment as confirmed. They disposed of ir Halifax business, and came up to ndon. It is further recorded in this nute of evidence, that the only competition t they have since entered upon, the new nicipal buildings in Edinburgh, was decided their favour also. Mr. Lefevre's experience buildings, and his good taste and architec-al knowledge, make his evidence of par-ular value. He says: "I undertake to say t the plan of Messrs. Leeming and Leeming, regards its interior arrangements, cannot well improved upon. It is infinitely superior ny existing public building that I know of. n perfectly prepared to defend the scheme n all points upon which it has been criticised ersely as regards its interior arrangements." Christian's evidence is equally strong. He s distinctly that he considers Messrs. Leem-s' design "the work of a master of the t." Referring to the internal arrange-nts, Mr. Christian speaks highly of the ting and ventilation of the building, and of corridors specially, several other plans ing been condemned on those grounds. J. McVicar Anderson agrees substan-ly with Mr. Christian, and observes Messrs. Leeming have won their posi-honourably in competition, and that he resented the feeling of the profession gene-y. Mr. Philip Charles Hardwick also ex-ses similar opinions upon the merits of the gn. Alluding to the alternative plan by srs. Leeming, showing the extension of the ting Admiralty, Mr. Hardwick observes he uld be sorry to see it adopted instead of the selected. He thinks it a mistake to take old structure as the datum of a large new ding as regards the elevation. He even ks it would be preferable to cut down towers and reduce the external orna-ation than to extend the old Admiralty. rs. Leemings' elevation, he says, has one quality—fine proportion. "If you cut off all the ornament from Messrs. Leemings' building there will still be a stately structure." We may add that Messrs. Leeming, in their evidence, approve of Mr. Taylor's plan in the main, taking the present Admiralty buildings as an integral part of the arrangement. The plan illustrated is based upon this idea, the Park front determining the treatment of the elevations, which are simple.

The report concludes that by making additions to the present Admiralty all the requirements of that department may be suitably provided for; that this work, including repairs to the existing buildings, can be done at a moderate cost, and may be completed within two or three years; that a very large reduction of expense for building would thus be secured. Space and time forbid us noticing further the evidence elicited by Mr. Shaw-Lefevre, Mr. Isaacs, Sir W. Harcourt, Mr. Hardcastle, the Hon. David Plunket, and others. The evidence of Mr. Taylor is of particular value, to which we should have liked to refer in detail. The Right Hon. W. H. Smith's evidence is instructive. He finds no complaint with the internal arrangement of the design, and admits the architects showed great ability and skill, but says, "I am not satisfied, and never have been satisfied, with the conditions, nor have the late First Commissioners themselves." From the whole, it is pretty evident that some one has blundered in the first instance, and, as usual, the architects who complied with conditions have had the brunt of the mistake to bear. As Mr. McVicar Anderson points out, the great public improvements, the widening of Whitehall, and the opening of the Mall, ought to have had the first consideration. But we break off here. The plans in the appendix are seven in number, and include the plan of the site with Messrs. Leemings' first design—the view of the building towards the Horse Guards Parade; then alternative elevation, suggesting the reduction of height of the south-eastern wing next the Horse Guards; the plan of proposed additions to the present Admiralty, to which we have referred, elevation of the same, and sections of proposed alteration to that building; also a plan of proposed new War Office on Whitehall-place site.

COMPETITIONS.

Chelmsford Workhouse.—The Chelmsford Board of Guardians considered, on Tuesday week, the plans sent in under motto by three local architects—Mr. Fred. Chancellor, Charles Pertwee, and Frank Whitmore—for the rebuilding of the workhouse. A committee reported that they had considered the three schemes under the mottoes—"Union is Strength," "Adaptation," and "Kelpie," when, the last named plan having been eliminated, there appeared six votes for "Union is Strength," and four for "Adaptation." The Board adopted the recommendation of the committee that the plan "Union is Strength" be selected, and on opening the sealed envelope this proved to be that by Mr. Chancellor, while "Adaptability" was sent in by Mr. Pertwee. The Building Committee were instructed to meet Mr. Chancellor, and complete the plans and specification for the Local Government Board.

CHIPS.

The building committee of Heath Town local board have accepted the plans of Mr. C. Manton, architect, Wolverhampton, for the erection of new offices on the Wolverhampton-road at a cost of about £1,000.

An arrangement has been entered into between the Lanchester and Chester-le-Street sanitary authorities to have a joint sewerage scheme, to be carried out under the supervision of Mr. Balfour, C.E., of Houghton-le-Spring, at a cost of about £1,000; the proportionate shares to be borne by the two authorities being—Lanchester £350, and Chester-le-Street £650. The scheme has received the sanction of the Local Government Board.

A memorial drinking fountain and public lamp have been erected in the centre of Swan Bank-green, Congleton. Messrs. McFarlane, of Glasgow, were the founders.

A new Soldiers' Institute in Cliffold-street, York, was opened by the Archbishop of York on Friday. It is Italian in style, and has been built from designs by Mr. E. Taylor, of Stonegate, York.

Engineering Notes.

The Manchester Ship Canal.—At the half-yearly meeting of this company, held on Monday, the Chairman, Lord Egerton of Tatton, announced that the land survey and plans of works had been prepared, and they only wanted to make final arrangements with the landowners before proceeding vigorously with the work. A contractor for the whole of the work sanctioned by the Act of 1883 had been secured—namely, Mr. T. A. Walker, who had been contractor for the docks at Preston. The contract provided that the works were to be completed in four years from the date of their commencement for the sum of five and three-quarter millions, £500,000 to be paid in shares if desired by the company. He believed there would be no difficulty in executing the works in the stipulated time. Hopes were entertained that they would be able to induce the Queen or the Prince of Wales to cut the first sod, or lay the first stone, in connection with the canal.

University College, Bristol.—A new departure in engineering education is being made by this college by the generosity of local firms. As the outcome of a meeting held early in the present year, most of the firms of the neighbourhood have agreed to institute bursaries or scholarships at their works. The holders of these are to be nominated by the college authorities. Some will be awarded on the results of the annual examinations, while others will be reserved for deserving students unable to pay the usual premiums required on entrance into works. The educational scheme adopted at Bristol does not include any attempt to impart practical workshop instruction within the college walls; but the students spend six months (April to October) in each year, acquiring practical experience in the works and drawing offices of the engineers of the West of England. This system is found to answer so well that Messrs. Stothert and Pitt, of Bath, and the Bristol Waggon Works Company propose to make it obligatory on all their pupils to attend the college courses in the winter months for the first three years of their pupilage. Several firms are willing to take college students for short periods, so that civil engineering and electrical engineering pupils may spend one or two terms of six months in works; while at the same time mechanical engineers may have experience in two or three different establishments during their college career. In return for these concessions the council of the college has decided to permit deserving apprentices or artisans, nominated by the local engineer, to attend the college courses at reduced rates. Nine first-class scholarships and a larger number of second-class ones will be available during the coming session.

Advantage has been taken of the rebuilding of the outer walls of the chambers in King's Bench Walk, abutting on the Whitefriars entrance to the Inner Temple, to replace the old wooden gateway at this entrance by an archway of Portland stone and a porter's lodge, consisting of a two-storied octagon tower of stone. On top of the archway a shield with the date has been carved, while over the footway a carved panel, with the emblem of the Inner Temple—the flying horse—and a shield on each side, with the arms of the late and present treasurer of the society, has been placed. Mr. Arthur Cates is the architect, and the works generally have been carried out under the direction of Mr. W. Oldrieve.

A new laundry and females' dining-room have just been added to the Armagh District Lunatic Asylum from plans by Mr. John Boyd, of Belfast, who was also the architect for several previous enlargements, including the infirmary, new dormitories, and day-room and chapel. The builders were Messrs. Collen, Portadown and Dublin, and the engineering work was carried out by Messrs. Gardner and Co., of Armagh, the total cost of the present works having been £6,000.

The West-end Chapel—the oldest Nonconformist place of worship in Wellingborough, having been built in 1791—which has been closed for alterations and repairs, was reopened on Sunday. The work has been carried out by Mr. Slim and Mr. G. Hacksley. The building has been re-roofed, has new windows and new seats, and is match-boarded to the height of 4ft., while a piece of the south side is partitioned off for a Sunday-school.

Building Intelligence.

BIRMINGHAM.—In order to expedite the work of laying down the cable tramways between Colmore-row and Hockley, the contractor, Mr. Jacob Biggs, of Farm-street, Hockley, has this week completed an installation of the electric light, by the aid of which gangs of men will be able to work by night as well as by day. It is probable that the line will be laid, the depot built, and the whole system of Birmingham cable tramways ready for inspection early in October. With reference to the proposed line from Hockley Brook to the New Inn, Handsworth, a difference has developed itself between the Central Tramways Company and the Handsworth Local Board. The engineers had drawn the plans of this portion of the line, had got in tenders, and were finally considering them when the board required the laying of wood paving between the lines, with which the engineer could not comply. The electric light installation has been undertaken by Messrs. Fowler, Lancaster, and Co., of Graham-street, and consists of five arc lamps, of the Pilsen type, having an illuminating power of 2,000c.p. each, and being placed thirty-five yards apart. The rails and pulleys have been fitted together and numbered at the works of Messrs. Tangye, so that they will be readily placed in position. The contract is for 4,553 yards of single line. During the construction of the line improvements have been made in the methods hitherto used upon cable systems. Pulleys of a new type are being used. The tender of Messrs. J. and E. Wright, of Birmingham and London, has been accepted for the supply of the rope, in preference to ten other tenders; it is to be 3⅜in. in circumference, and will be composed of six strands of nineteen wires each, and is to have a tensile strain equal to ninety-five tons per square inch. Its "elongation," or stretch, must not exceed 1¾ per cent., and it must bear a torsion test of fifty-five turns in a length of 8in. The cars, which have been made by the Falcon Company, Loughborough, are nearly completed. They are of special design in several points, including a novelty in the gripper, which will diminish friction. The depot at Hockley Brook occupies two acres of ground between Whitmore-street and Hockley Brook. The buildings consist of a car-shed, boiler and engine houses, a tension shed, a repairing shop and smithy, a foreman's house, with rooms for workmen, and a waiting room.

CARLISLE.—The new public abattoirs, built in Devonshire Walk, from designs and under the superintendence of Mr. McKie, city surveyor, have just been completed. The site, a triangular area, is surrounded by a brick wall 10ft. in height, and approached by a new 30ft. road, which, like all the thoroughfares and passages, is of concrete. The cattle boxes and sheep pens are under one roof to the right of main entrance, and adjoin the killing and cooling rooms. The ventilation of the slaughter-houses is carried out on the fixed louvre principle. The provision of water is ample; and Adams's automatic flushing tanks are connected with the drains. The walls in the interior of the abattoirs are of glazed bricks up to a height of 6ft. To the left of the main roadway are the offices and the piggery and tripery. The louvre roofs in the pig slaughter-house and cooling room and tripery, and also the overhanging roof of the cooling rooms are glazed on Helliwell's patent system. The contracts amounted to upwards of £5,000, and the contractors were as follows:—Building and concrete work, Messrs. Beaty Bros., Carlisle; joiner and carpenter work, Messrs. Baty and Forster; slater, Mr. Smith; plumber, Mr. Anderson; painter and glazier, Mr. Palmer.

HANLEY.—The foundation stones of a new Victoria Assembly Room for Hanley were laid on Monday. The site is at the rear of the Town Hall, and completes the scheme of municipal buildings. On the site, Mr. J. Lobley, the borough surveyor, who has prepared the plans for the edifice, at the request of the Mayor, gave a description of the new buildings. He said that the point to which the Town Hall Committee had given attention was the construction of a room capable of holding a very large audience which should be second to none in the district, and which should also possess good acoustic properties. The question of ornamentation was reserved for future consideration. The main façade, towards Bagnall-street, would be of a character which would bear favourable comparison with the other portions of the Town Hall. Internally, the structure would be about 133ft. long by 64ft. wide and 55ft. high. It would contain two galleries and a large orchestra, and would seat 2,700 persons; but on great occasions the seats could be removed from the arena, and then there would be room for 5,000 or 6,000 persons to stand. Corridors would be constructed outside the internal walls, so that the sound of persons walking about would not be heard inside; and the galleries would be held to the walls by cantilevers, so that there would be very few columns to obstruct the views of the audience.

LLANDAFF.—The monument to be erected to the memory of the late Bishop Ollivant in the north aisle of Llandaff Cathedral has been removed from Burlington House to that city, and the work of erecting the tomb on which the marble slab will be placed has commenced, everything having been prepared, the blocks of marble forming the pedestal to the slab being carved and fitted, requiring only to be placed in position. The tomb is from a design by Mr. Clarke, of Llandaff, and has been carved by him. It is of white and Sienna marble. The figure of the late Bishop, which is reclining in Episcopal robes on a bed, with hands clasped as in prayer, is the work of Mr. H. H. Armstead, R.A. The work was exhibited this summer at the Royal Academy, and was illustrated in our photo-lithographic pages on the 12th ult.

CHIPS.

The church of Hackness, Scarborough, has received an addition to its stained glass of a window from the studio of Mr. Taylor, of Berners-street. It is a Jubilee gift.

A "Grand Hotel" is about to be built on the Promenade at Sutton, Lincolnshire, at a cost of £16,000. The first section, which is to be proceeded with immediately, will include in the basement vaults, smoke-room, and dining-room; on the ground floor, dining, smoke, and billiard-rooms, six sitting-rooms, and 15 bed-rooms; on the first floor, nine sitting and 19 bed-rooms; on the second floor, kitchen, scullery, laundry, seven bed-rooms, giving a total of 8 public rooms, 15 sitting-rooms, and 41 bed-rooms. Mr. Herbert Walker, C.E., of Nottingham, is the architect.

The award of the umpire in the arbitration between the Cockermouth Local Board and the Cockermouth Gas Company for the purchase of the company's works, has been made known. The local board considered that the company should have about £8,000, with £1,500 for certain contingencies; while the company alleged that £18,700 was the value. The arbitrator gives £14,644, which, with the contingencies, will bring the amount up to over £16,000.

The extension of the Fish Quay at North Shields has just been completed after two years' work. Mr. Charles Jackson, of Newcastle-on-Tyne, was the architect.

A portion of the reredos for Lillington Church, near Leamington, consisting of a handsomely-carved Caen stone panel, representing the "Lord's Supper," is now on view at the show-rooms of Jones and Willis, 79, Edmund-street, Birmingham, who will be very pleased to show it to visitors.

In the City of London Corporation for the present year the Tower Bridge construction account figures in the accounts for the first time, and from it it appears that the cost of the ceremony of laying the foundation-stone was £2,882, and the late Sir Horace Jones was paid £5,250 in addition to his salary as City architect for services in connection with the bridge.

On Saturday the corner-stone of a new branch public library was held at Bolton. The site for the library, containing 600 square yards, is in High-street, Great Bolton, and the architect for the new building is Mr. R. K. Freeman, of Bolton. The style is Gothic, plainly treated, and the building will be of brick with stone dressings, the total cost being £2,000.

St. Nicholas Parish Church, Rochester, has just been renovated at a cost of £600, and the edifice was reopened for Divine worship on Sunday. The renovation is from the plans of Mr. John Drake, of Rochester, and the structural work has been done by Messrs. Callard and Son, of Rochester, while the decorations have been carried out by Messrs. Robson and Son, of Rochester.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions our correspondents. All communications should drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France, Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi) £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLII., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—C. of G.—J. T. D. and Co.—M. O.—B. of L.—R. C. and Co.—D. and Co.—S. T. C.

Correspondence.

THE ARCHITECTURAL ASSOCIATION AT BATH.

To the Editor of the BUILDING NEWS.

SIR,—Mr. Halsey Ricardo challenges my remark that Prior Park was built as an advertisement for Bath stone, and assures us that instead of being "a dismal piece of building," as I described the house, it is a "really noble" structure. Mr. Ricardo certainly is welcome to his opinion as to the beauties of Wood's design, though in my judgment Prior Park is an excessively poor piece of work. That it was actually erected as an advertisement, the following quotation from Wood's own description of the house will amply verify, while the architect's glorification of his own design furnishes the best answer that I can give Mr. Ricardo:—"Notwithstanding all the methods that were taken to Reduce the Prices of Stone and the Workmanship of it, Mr. Milo Smith, one of the Proprietors of the Navigation, soon became a Competitor with Mr. Allen in the Trade he had embarked himself in, though he did not long continue so; and his Works dropping, the Quarries at last became the Property of the Person he opposed; whose Designs in the Stone Business have from time to time been very much defeated, partly by the Troubles and Disappointments inseparable to all manner of Trades; partly for want of Freight for the Exportation of Block Stone, and partly by the Chief Master Masons of the Country Reducing their Prices still lower than he himself had abated them to obtain Work, and thereby keep as much of the Domestick Trade of Bath in their own hands as possible. Besides all this, the introduction of the Free Stone into London met with great Opposition, some of the opponents comparing it to Cheshire Cheese, liable to breed Maggots that would soon Devour it; and the late Mr. Colen Campbell,

Architect, together with the late Messeurs Hawksmoor and James, as Clerks of the Works of Greenwich Hospital, were so prejudiced against it, that at a Public Meeting of the Governors of that Building at *Salters' Hall* in the spring of the Year 1728, they Represented it as a Material unable to bear any Weight, of a Coarse Texture, bad Colour, and almost as Dear as *Portland* stone for a Publick Work in or near London." Wood says he was present, exhibited some specimens, and brought a Bath mason with him to give practical illustrations. The result of all this inquiry was that the price of Portland stone was reduced "full three-and-thirty per cent. below what had been formerly paid!" "This great Abatement entirely defeated Mr. Allen's Proposals for carrying on the Masons' work of the Hospital with this stone; and *the Reflections cast upon the Free Stone of the Hills of Bath brought him to a Resolution to exhibit it in a seat which he had determined to build for himself near his works*, to much greater Advantage, and in a much greater Variety of Uses than it had ever appeared in any other Structure." "With this view several Designs were formed wherein the Orders of Architecture were to shine forth in all their Glory; but the Warmth of this Resolution at last abating, an humble simplicity took place, and the first part of the Seat that was carried into Execution in Pursuance of it was the Westward Wing."

The author then describes this "Fabrick," and adds: "Of the External walls only that which Fronts towards the South is Faced with wrought Free Stone; and this was to have been performed in such a manner as to Exhibit the Doric order, under its plainest Dress, but so high as to include the Principal and half Story, though separated by a Fascia. A Tetrastyle Frontispiece was therefore introduced in the middle of the whole Line before such an advanced Part of the Building as was sufficient to contain two of the Stair Cases on each side of the end of the Hay House and at the same time, appear as a proper Basement to the Pigeon House, which was to have Crowned the Center of the Edifice with Magnificence and Beauty: For the Basement extends fifty Feet; and a Square of that Size in the Middle of this Fabrick was to have been covered with a Pyramidal Roof, divided into Two parts, to discover the Body of the Crowning Ornament." "This Essential Part of the Building was omitted in the Execution of the Work." . . . . "Within this super-structure" (the Pavilion) "the Pigeons are magnificently Housed; and their particular Cells are all made with wrought Free Stone; So that if a Beautiful Habitation is really an Allurement to this Species of Birds, as some pretend, Mr. Allen's Pigeons will, in all Probability, never desert their Present Place of Abode." . . . "About Eight hundred Tun of Free Stone in large Blocks was buried under Ground to make the Foundation walls or Stereobata of this Structure" (the House) "and the Stylobata (or Ground Story) of the House was erected both Inside and Outside, with wrought Free Stone." . . . . "For the sake of Novelty, the Outside of the Building shows in its Rear an Hexastyle Frontispiece composed of Ionick Columns supporting a Corinthian Entablature divested of its Beauty for the Convenience of such windows as would give a Prospect to the Garrets; but in Front the Architecture is more compleat; and Mr. Colen Campbell having boasted of the Justness of the Hexastyle Porticoe designed by him before Wansted House, in Essex, it was determined that a juster Hexastyle Porticoe should be executed before this House, and with columns of a larger Size; and for this End, I Designed it with Columns of three Feet one Inch and a half diameter, which exceeds those of Wansted by an inch and a half; made the Intercolumnation of that Kind which Vitruvius calls Systylos; and gave two compleat Intercolumnations to the Flank of our Porticoe, instead of the compleat Interval and small Portion of another at Wansted." "*Now, as the Seat was thus far sufficient for displaying the Material proposed to be recommended to the public by it*, the Perambulation of the Curious was thus designed. After viewing the stables in the simplicity of the Dorick Dress, and coming under the Pavilion, great in its kind, they were to enter an Ionic Gallery which would have had the effect of a vast, long stage to a Rich Theatre; and this leading them to the stone passage that Traverses the Basement Story of the House from whence they were to ascend, by a Flight of Stone Steps to a Stone Hall of the Corinthian order, and then pass into the stupendous Porticoe of the same order. Returning from this Pavilion into the Hall, and passing through the Dining Room, Dressed with the Corinthian Order, a Stair Case, inriched with the same Order, was to amuse them while they were ascending to the gallery in the Chamber story proposed to have been finished with all the Elegance and Beauty that could possibly be given to works of the Corinthian Dress; and from this gallery they were to pass into the Tribunal seat of the Chapel, where the Corinthian order was to increase in Magnificence; and by representing Cherubims and Palm Trees placed Alternately, give them an Idea of the manner in which King Solomon finished the Inside of his Temple in Jerusalem." "The fame of Mr. Allen's stone works was thus soon carried to the Principal parts of the Kingdom," and Wood, the author of this masterpiece, was engaged for five years to correspond with such inquiries as were likely to result in business; but, he adds, "I have the justest Reasons to Lament that my Time had not been better employed." Mr. Ricardo confuses the two Woods, or does not know more than one. The younger Wood designed Pulteney-street, which is pure stuff in comparison with the elder Wood's work in Queen-square. The Assembly Rooms are attributed to the younger Wood; but it was John Wood the Elder who built Prior Park. His "Essay," from which I have quoted, was published (2nd edition) in 1749 by C. Hitch, in Paternoster-row, and by J. Leake, at Bath (Vol. II. page 426, &c.).—I am, &c.,

THE WRITER OF THE ARTICLE.

SIR,—I cannot quite make up my mind whether Mr. Halsey Ricardo, who writes in your last issue, is in earnest or not. Scores of people have written about Bath; but Mr. Ricardo is the first who has spoken so disparagingly of its natural situation, which has been compared favourably, in turn, with Edinburgh, Rome, and Jerusalem. His eulogy on Wood, on the other hand, is considerably exaggerated. Not only are there gross errors in his planning of streets, but his architectural detail is very insipid in quality, whilst his masses and outlines are singularly ineffective, except in Prior Park, and it is ludicrous to hear him compared with Michael Angelo and Wren. In these points, however, Mr. Ricardo is merely stating his own hastily-formed opinion; but he is also wrong in matters of fact. Wood did not lay out or design either Pulteney-street or Camden-crescent. The first was the work of Baldwin (for some time city architect), completed by Pinch; and Camden-crescent, like the Royal, was designed by *the son* of the man who designed Queen-square, &c.

It is not surprising that Mr. Ricardo should say he "did not know Wood had written a book, 'The Beauties of Bath,'"—that was a misdescription of your own reporter. The book was entitled "An Essay towards a Description of Bath." I make these corrections because it seems to me that if it is worth while to give particulars of places and men at all, it is well to do so accurately, even if it involves a little trouble.—I am, &c., C. P. EDWARDS.

158, Strand, London, W.C., Aug. 31.

ARCHÆOLOGISTS AND FREE LUNCHES.

SIR,—Mr. Sands' letters on the shortcomings of archæologists would not be worth noticing, except that being published in a journal of established reputation and wide circulation they are liable to mislead persons unacquainted with the facts of the case. Two specific charges have been brought against archæological societies—(1) that they have degenerated into associations for obtaining free lunches, under the pretence of visiting localities where objects of antiquarian interest exist; and (2) that their governing bodies throw cold water on aspirants to archæological fame. With regard to the first of these charges, nothing can be said against the Societies of Antiquaries of London or Scotland, as neither hold annual meetings of any kind. The British Archæological Institute has a special by-law which prevents that body from accepting hospitality from anyone and I should be very glad to see a similar rule enforced by the British Archæological Association, so as to prevent the possibility of any misunderstanding as to the motives which guide the Council in arranging the programme of their excursions. Admitting, however, that archæologists are so far human as to thoroughly enjoy a good lunch, with plenty of brown sherry, at someone else's expense, the papers published in the volumes of *Proceedings* conclusively prove that eating and drinking is not the main object of the annual meetings of antiquarian societies; and, after all, local magnates are not obliged to feed hungry archæologists unless they like. It must not be forgotten either that the labourer is worthy of his hire, and that the generous providers of free lunches get a certain *quid pro quo* in the after-dinner speeches, and the learned remarks of the members on the objects inspected.

Lastly, that the councils of the different societies discourage genuine scientific workers, however humble, is not in the least true; but some of the councils, amongst which I am glad to number that of the Society of Antiquaries of Scotland, try to suppress conceited dabblers, who bring discredit upon everything they touch. It is far better that the Pictish towers of Shetland should remain buried for a century to come than that they should be explored by persons wholly unfitted for the task.—I am, &c., J. ROMILLY ALLEN, F.S.A. (Scot.)

5, Albert Terrace, Regent's Park, London, N.W.

STRENGTH OF BRICK PIERS.

SIR,—The short article in your last number, headed "Size of Brick Piers," reminds me of the vagueness of all the information given on this subject. When we have any doubt about the strength, such as requires a reference to any formula, we naturally build in a very hard, square brick, and in cement; but it is just here that we are quite in the dark, and have no information at all. It is most desirable that we should have formulæ for at least three kinds of well-known bricks—say (1) square, well-burned, so-called "London" stocks, such as are made at Ware, Uxbridge, and the Sittingbourne district; (2) some standard-pressed red brick or Gault clay brick; (3) blue Staffordshire brick. The last most important of all, as being the brick which will resist the most crushing. Then each should be given with a described lime-mortar and a described cement-mortar, with the necessary calculations for modification, according to height, for detached pier and corrections following the strutting or tying-in of the piers. How can this desirable information be obtained? It is scarcely to the credit of architects and builders that they know so little of the matter in the shape of general trade information or professional knowledge.—I am, &c., J. RICHARDS.

Maxted-road, Kensington, Aug. 29.

NUISANCE FROM SEWER VENTILATORS.

SIR,—From Mr. Buchan's letters on this subject I am compelled to draw one of two conclusions. Either he wishes, by sarcasm and personalities, to stifle the matter so as to prevent its being discussed in your columns, or he is giving his ideas on a subject with which he has had little or no experience.

The heading of my letter of July 8th was "The Nuisance from Sewer Ventilators," and in *England*, when speaking of sewers or sewer ventilation, we mean that section of the drainage system situate on the sewer side of intercepting traps.

This definition can be found in the Public Health Act, 1875. Had I been writing on the subject of house drainage, my letter would have been headed "The Nuisance from Ventilators on House Drains." Mr. Buchan has throughout treated this question in a peculiar manner. He first doubts my statement as to the pipe being clear, suggesting that 10ft. of pipe and a ventilator would give ventilation. When asked to state what additional power he would obtain by this addition, he refuses to answer, and quotes the results of a test applied on house drains under the most favourable circumstances, which is quite foreign to the question at issue, and is not at all applicable to sewers.

My statements have not been arrived at

hastily, nor from single tests, but from many which have been amply verified. I will, however, quote another case. In a large district on the Metropolitan area shafts were built on the higher points for the purpose of obtaining an up-current to relieve the sewers; instead of getting this, a downward current was experienced. The result of testing the temperature of the air in the sewers was that during 12 months it was never under 50° or over 55°. Now compare the temperature in inlets and outlets from May to September, and it will be seen, as I have before stated, that it is impossible to get a circulation of air unless the means used are of a more powerful nature than the variable atmospheric pressure between these periods. From this statement it must not be inferred that the air was stagnant, as there are other powerful agencies which prevent an up-current, and which I should have dealt with in this letter had Mr. Buchan dealt with my former letter in a practical manner.

Mr. Buchan refuses to answer my question: What power per square inch could be got out of 10ft. of additional pipe, and a ventilator, but says, the latter "would enable wind to get at the top of the pipe, so as to exert an expiratory or sucking-out effect upon it, and so cause an upward current in the pipe." Will he state that with the wind blowing at the rate of ten miles per hour on ventilator, the temperature on the top of the pipe being 80°, the horizontal part or sewer 50°, the bottom or inlet 85°, that, under these circumstances, he can get an upward current? When he has done this, I will give further tests which have been proved and verified to confirm my first statement, and also state more fully what I mean by barometrical pressure.

In this correspondence I have not mentioned the work of either A, B, or C, and I have purposely refrained from mentioning any work of my own, and if any "prefatory blast" have gone forth it is from "my fixed exhaust ventilators."—I am, &c.,

R. H. REEVES.

Cedardale, Putney, Aug. 31.

IRISH TENDERS.

SIR,—For some 10 or 12 days previous to the 22nd advertisements appeared in various papers inviting tenders for building a new hotel at Crosshaven, in this county. The result was that four tenders were sent in, and, to the surprise of other candidates, one of the competitors, who happens to be married to the architect's sister, was declared contractor.

Now, Sir, no one questions the fact of his tender being lowest, and, therefore, entitled to the work; but was it good taste on the architect's part, or fair to other parties about to tender, to bring or allow his relative from Waterford to be a competitor for any work of which he may be architect?

There are many reasons why he should not, and builders will readily understand them.

I would strongly advise that in future no builder should send in a tender for any work under this gentleman, unless he adds some such footnote to his advertisement as the following: "The architect guarantees that no tender will be considered from any relative of his."—I am, &c.,

Cork, Aug. 26. LOCAL BUILDER.

The whole of the gasfittings for Alleyn's boys' school at Dulwich, the architects of which are Messrs. Oliver and Leeson, of Newcastle-on-Tyne, have just been supplied by Jones and Willis, of Birmingham and London.

The new building at present being erected in Bloomsbury-square for the Pharmaceutical Society of Great Britain (Messrs. Lansdowne and Harris, architects) is now rapidly drawing towards completion. Great attention has been paid to the sanitary arrangements and the ventilation, Messrs. Robert Boyle and Son's system being applied throughout. Messrs. Boyle's patent heating tubes are also used for warming the fresh air supply to the large examination hall.

Mr. W. Telford Gunson, architect, 10, Marsden-street, Manchester, has been unanimously appointed assessor by the Swinton and Pendlebury Local Board to report and advise upon the competition plans for the proposed public baths for the district.

The offices of the Civil and Mechanical Engineers' Society have been removed to 6, Queen Anne's Gate, Westminster, S.W., at which address the meetings will be held in future.

Intercommunication.

QUESTIONS.

[9379.]—**Swimming Baths, &c.**—Will any of your readers be good enough to inform me of any book or books on the construction and planning of baths (Turkish, swimming, and private)? Also name any towns where baths have been erected with the latest improvements.—EBORACUM.

[9380.]—**Concrete.**—If a specification is prepared for making concrete mixed with cement 5 to 1 in blocks, and ordinary loose-made concrete 6 to 1, and it is hereafter agreed to make it 12½ per cent. less, what would then be the proportions of mixing in each case?—H. M.

[9381.]—**Extras.**—A builder enters into an agreement to complete a contract on a certain date; in default of completion he is to pay a weekly penalty until the whole of the property is complete in every way. The proprietor asks the builder to do certain extras, but stipulated that the largest of these extras were not to interfere with the contract time for completion. The builder does not complete at the specified time, but sufficient for some of the houses to be tenanted. Does the doing of the extras, in your opinion, invalidate the original agreement and so entitle the builder to more time? Or do you think the penalty can be enforced? Can anyone refer me to any decided case on the point?—YOUNG SURVEYOR.

[9382.]—**Soil Ventilation.**—I shall feel much obliged if you will give an opinion in your valuable journal on the following point? It is now well understood that in all cases in which the surface of the soil is left uncovered beneath the rafters supporting the ground flooring of a house suitable ventilation through the walls preserves the timber and prevents rot. If, however, a layer of asphalte be run on the soil, and the rafters placed down upon this, is it necessary or desirable that provision be made for ventilating as in the case in which the soil is uncovered?—WM. THOMAS.

[9383.]—**Echo.**—Can any reader of the BUILDING NEWS tell me how to prevent an echo in a church lately erected? The size of church is 160ft. long by 60ft. wide, and about 45ft. high, inside dimensions.—COLONIAL.

[9384.]—**Half-Timbered Work.**—Will Mr. James Thorneloe, or other of your readers, recommend a good work on half-timber construction—both the framing and plastering—or give particulars himself?—IONA.

[9385.]—**Strong Room.**—Are strong rooms usually ventilated? If so, what is the best known means to be adopted in order to be safe against fire, &c.? Early replies will be esteemed a favour.—DOUBTFUL.

REPLIES.

[9348.]—**Boundary Line.**—No doubt, as "Z." says, old surveyors followed the usage of allowing 1ft. beyond the centre of hedge; but it is not a universal rule by any means, and where there is only a hedge between two fields, the probability is that each party, by exercising acts of ownership, have become tenants in common of the hedge. I believe it will be found that single hedges (unless the facts are known) are to be taken in this way.—G. H. G.

[9359.]—**Rustless Iron.**—"A Constant Reader" can get all information from the Managers, Bowes, Scott, and Read, of Broadway Chambers, Westminster.—BOWES, SCOTT, AND READ.

[9374.]—**Building Construction — Honours Examination.**—Having obtained a first class in the Honours examination, I am enabled to recommend the following list of books as being worthy of study:—Rivington's "Building Construction" (3 vols.), Seddon's "Builders' Work," Hurst's "Architect's Handbook," Humber's "Handy Book on Strains," Rickman's "Gothic Architecture," and the "Orders and Styles of Architecture," published by Weale. I would advise "Provincial Pupil" to work the questions set at previous examinations, as some of the questions are often repeated. If "Provincial Student" fails to obtain a first-class certificate the first time, let him try again until he succeeds, as the examination is very stiff, there being on an average only four first class certificates awarded in England.—W. EATON, Manchester.

[9378.]—**Salisbury and Exeter.**—Apart from their cathedrals, the latter city, at least, is decidedly poor in Mediæval interest. At Salisbury, a visitor should observe it is our only city founded in Pointed-arch times (1220), and therefore void of anything Norman. New Shoreham, Winchilsea, and Hull were minor products of the same century, but this alone was planned as its model city. Unlike any earlier English place, all its streets are straight, of uniform width, and do not meet without crossing. The bounding ones, N.E. and S., form a rectangle, but most of the interior crossings deviate about 20° therefrom. Except the easternmost blocks, which rise a few feet up a slope, the site is so level that, being more than half-inclosed by the Avon to the W. and S., it was planned to divert streams from the bend of that river above to that below, through every street, meridional or transverse, each stream turning at some crossing from an E. to a S. course, and so by zigzagging or branching, irrigating every street. It was a refinement on what Bishop St. Ethelwold had done in Saxon times to the flat part of Winchester. I remember these channels all open, brick lined, bridged at every few yards, and not without fish; but they are now, for a second time, all covered, even that which bounded the close outside its wall. The only old street that I think had none is now oddly called "New Canal," as it was, like "Canal Walk" at Southampton, to be the terminus of a canal between the two cities, which was dug but remains dry. This was a 19th, not a 13th, century exploit. Another notion of the founders was to have much fewer and larger churches than other cities, and Our Lady's Cathedral being at the S.W. corner, to put but one at each of the other extreme corners (all named after martyr bishops), and St. Thomas-á-Becket by the central market-place. It is very odd that, away from the cathedral, the contemporary Hospital of St. Nicolas and the bridges, nothing earlier than "Perpendicular" (at least no window earlier) is in the present buildings. The city was never walled, but the very large close was so under Edward III., with four gates for the half of its circuit that the Avon does not bound. On the outer face, chiefly between the two east gates, are various pre-Norman decorative stones, brought from Old Sarum, which I have never seen drawn, though they are probably the oldest bits of ornament in England. Near this, in St. Anne-street, "T. C." will enter, through the rather poor city museum, the Blackmore collection of pre-historic wrought flints, by far the chief one in the world. Other modern sights are the Elizabethan Longford Castle, two miles south; Wilton House, three miles west; and the costly church of that place by the late Earl. Beyond it are Mediæval Tisbury Church and Wardour Castle, in by far the finest scenery within 30 miles. North, eight miles, are Ambresbury Church and Stonehenge, and two miles on the way to them, Old Sarum. As for the cathedral, it is utterly invaluable as the only one finished in its century, and main type of all English Gothic development, consequent wholly on the vaulting of the clerestory. It is doubtful, of our vaulted ones, whether this or Canterbury or Lincoln were the earliest designed; but Chartres preceded them, and is for the art in general what this is for England. There both outer and flying buttresses were first frankly developed; but here only the former, which are most admirable, and far superior to the French without half their mass. But "Elias the Engynier" still objected to visible flying ones, and made his steep aisle roofs to conceal them. It soon appeared he had pitched them too low, and no English building repeated the error, unless Wykeham's nave at Winchester, where the huge mass of Norman walls permitted it. All the vaulting here, except the square under the tower, is original, and though on the feeblest supports, is the heaviest in England, near 2ft. thick, and of concrete. Henry III. saw the whole begun, finished, and opened, the masonry ending with the first story of the tower, against which the roofs end, a mere 2ft. wall, with an exquisite internal colonnade. Over this was intended, perhaps erected, a wooden steeple (like that on the detached belfry, demolished a century ago), but as high as the present spire. Those, then standing and afterwards burnt, on the central towers of Rheims, London, Rouen, and I think, York and Lincoln, were higher. The bold proposal of Richard de Farley, who had built Pershore Tower, to substitute this matchless work in stone, was happily accepted; but he began by a story about thrice the weight of what it stood upon, and probably no building in the world has so narrowly escaped disaster as this. The many visible flying buttresses were now added; either Farley or his successor made the next story far lighter, with the pinnacles and spire up to the first band, and the remainder someone else finished about 1330. The bit of vaulting to shut out the tower and the two arches across the great transept are of 1460, but the heavier ones across the lesser are by Inigo Jones, and the lesser transepts had no gables till about 1750. The absence of tracery in this place will be compensated for "T. C." by Exeter's gem of a cathedral, which, except the Norman towers, is nearly as uniform and complete a type of the Middle Gothic as this of the early. Unhappily, our English vice of dwarfing the churches' height had then begun. But a peculiarity of old Exeter, if any of the timbered houses that I knew remain, was that they had some stories of ten or more feet high, as in French towns. Elsewhere our ancestors hardly made any higher than 8ft. even in London, and the ground floor still less. On the way between these cities he should not neglect Sherborne.—E. L. G.

CHIPS.

The new line of railway from Alnwick to Coldstream will be opened for passenger traffic on Monday next. The entire length of route is 36 miles, and there are ten stations between Alnwick and Coldstream—namely, Edlingham, Whittingham, Glanton, Hedgeley, Wooperton, Ilderton, Wooler, Akeld, Kirknewton, and Mindrum.

The excavations proceeding in Piccadilly on the site of the new premises of the Junior Travellers' Club have brought to light numerous articles of interest, including a tomb of red granite dated 1509, some bronze armour, several fowling pieces, a richly embossed lamp, and a large quantity of vellum manuscripts.

The borough of Bootle has laid the foundation of a permanent collection of pictures, Alderman Poulsom having presented to the corporation a water-colour drawing of "Lancaster," by Mr. C. L. Saunders, which was exhibited at the Liverpool Water-Colour Society's Exhibition in the spring. The new gallery, in which there are several rooms well adapted for the purposes of an exhibition, will also contain the portrait of Alderman Poulsom, which was presented by his friends some time ago.

At the meeting on Tuesday of the King's Norton School Board, it was agreed to purchase various properties in Sherborne-road, on an area required as the site of a new school, for £4,316, and Mr. William Hale, architect, Colmore-row, Birmingham, was requested to prepare plans for the said school, to accommodate 1,200 children, on the understanding that if the plans prepared were not approved and adopted by the Board, 25 guineas should be paid him in satisfaction of all claims.

The Admiralty are going to build a large Coast Guard Station at Clacton-on-Sea, comprising officer's residence, and eight residences for the coastguard men. Mr. W. T. Hook, contractor, who lately made some new roads at Clacton, has been entrusted with the work.

The late Mrs. Thompson, of Seabrook Vale, Hythe, has bequeathed the sum of £10,000 for the erection and endowment of a new church at Cheriton, near Folkestone.

LEGAL INTELLIGENCE.

TOBOGGAN SLIDES AND THE BUILDING ACT.—In June last, at the Lambeth Police Court, a summons was taken out by the Metropolitan Board of Works against the proprietors and promoters of the Toboggan Slide at the Crystal Palace Grounds. The summons was heard from day to day, and frequently adjourned, so that full evidence could be given on both sides, and some rather curious points of law were raised upon several occasions. The summons was taken out originally against W. H. Smee, by Mr. Elkington, the district surveyor of Penge. It was shown by evidence that a certain structure termed the "Toboggan Slide" had been erected in the grounds of the Crystal Palace, and that it was used very largely by the public. The district surveyor complained that no notice had been given to the Board for the erection of such a structure, which, it was contended, was really a structure within the meaning of the Metropolitan Building Act of 1885. Arguments were used on both sides upon several days, the defendant's barrister contending that such an erection was not contemplated within the meaning of the Act, and further that, according to the Crystal Palace Company's Act of 1881, the defendant would be exempt from such notice. Mr. Biron, after several hearings, decided against the Board, but added that as several points of law had been raised he should be willing to grant a case for a superior court upon the points mentioned. It was urged further that even if part of the structure might be exempt, there were some parts which would come within the terms of the Building Act, and so make the defendant liable. Mr. Biron ultimately dismissed the summons, holding that part of the structure and erection came within the exemption contained in section 21 of the Crystal Palace Company's Act of 1881; but granted a case upon the points, and he has since signed such a document, leaving the following questions for the decision of the High Court:—First, whether the structures and erections complained of were buildings within the meaning of the Metropolis Building Act, 1855; and, secondly, whether they were exempted from the operation of the Metropolitan Building Act, 1885, by section 21 of the Crystal Palace Company's Act of 1881.

WATER SUPPLY AND SANITARY MATTERS.

STAFFORD.—The report of Prof. De Rance on the water obtained at Enson Moor has resulted in the Waterworks Committee of the Stafford Town Council deciding to recommend that body to abandon the work there. Prof. De Rance, in a long report, described the various strata at Enson, and showed that in the small borehole the quantity of salt varied from 29·99 grains per gallon in August, 1886, to 58 grains in August, 1887. In the large borehole the salt has continually increased from 19·75 grains on April 1, 1887, to 554·5 on August 6. A sample of water taken at a depth of 600ft. on August 4 showed 647 grains of salt. Prof. De Rance remarked that he should hesitate to recommend any water containing more than 15 grains per gallon as a source of water supply, and regrets that Prof. Attfield did not long ago call attention to the saline character of the water from both boreholes, especially as that gentleman has compared the water with some "table waters," which are obviously unsuitable for everyday human consumption or for manufacturing purposes. Prof. De Rance thought it very probable that the brine was entering the large borehole in the final 2ft., and if this was so, the filling-up of the lowest portion of the borehole would cut off the supply. The committee did not relish so arduous and uncertain an undertaking, and decided to abandon the works, and on Tuesday the town council reluctantly adopted the report, and referred the whole question of a water supply to a special committee. The town council have been very unfortunate in their borings for water, having expended £9,000 on the Common site scheme, and 7,000 on the Enson Moor scheme, absolutely without a gallon of drinkable water.

STOCKTON AND MIDDLESBROUGH CORPORATIONS WATERWORKS.—On Monday, the members of the two corporations, and the South Stockton Local Board visited the reservoirs at Fighting Cocks and Sadberge, and the pumping station at Broken Scar. At Fighting Cocks they inspected a fourth reservoir, now in course of construction at that place. On arriving at Sadberge, Mr. Bell, the chairman of the board, explained that the reservoirs there occupy 7½ acres of ground, and they will, when completed, have a capacity of 12 millions of gallons. The site is 200ft. above the towns of Stockton and Middlesbrough. Mr. John Johnson, of Middlesbrough, is the contractor. The board will use the reservoirs at Sadberge for the purpose of supplying Stockton and district, and the reservoirs at Fighting Cocks for supplying Middlesbrough and district. At Broken Scar, the last place visited, there are now 11 filtering beds, and 4 subsiding tanks, containing together 20,300,000 gallons. The company having inspected the filtering beds and engine houses, the Mayors of Stockton and Middlesbrough touched the actuating handles, and put the new pumping engines called the Stockton and the Middlesbrough in motion.

PARLIAMENTARY NOTES.

SUPERVISION OF BUILDINGS IN LONDON.—Sir G. Campbell has asked the President of the Local Government Board whether, in view of the fact that the supervision of all buildings in the Metropolis was intrusted to the Metropolitan Board of Works alone, and that their functions were necessarily delegated to subordinates, who were allowed to take fees, he would consider during the recess the propriety of introducing in English towns and the various local areas in the Metropolis some regular authority to supervise buildings, like the Dean of Guilds' Courts in Scotland. Mr. Ritchie replied that the care of all those matters in London devolved on the Metropolitan Board of Works, and through that Board on the various vestries. London was under a special statute in regard to such matters, and the Local Government Board had no control over them so far as the Metropolis was concerned.

BARS AND GATES IN LONDON.—Mr. T. Egerton, in answer to Mr. Lawson, said, on Monday, that the returns made by the Metropolitan Board of Works showed that there were 150 private bars and gates within the Metropolitan area. The Board were unable to state the conditions by which these bars and gates existed. In 1886 the Board inserted clauses in a Bill before Parliament to enable them to deal, under certain conditions, with some of those bars and gates that were most obstructive, but so much opposition was raised, both inside and outside Parliament, that the Board were obliged to withdraw the clauses, and did not see their way to renew the attempt.

PICCADILLY-CIRCUS.—Mr. De Lisle asked the hon. member for Knutsford Division, as representing the Metropolitan Board of Works, on Tuesday whether it had been decided to build upon the two small triangular open spaces recently added to Piccadilly-circus, and to join the blocks by a superstructure and tunnel for traffic; whether the ratepayers, or any representatives of those upon whom the charge would fall, had been consulted, or were to be consulted in that matter; whether the cost of devoting those spaces, without further ornamentation, to light and air could be stated; and what would be the probable cost of erecting there two fountains, independent of any architectural adornments. Mr. Alan de Tatton Egerton said that several schemes applicable to the two triangular open spaces recently added to Piccadilly-circus had been before a committee of the Metropolitan Board of Works, but no decision had been arrived at. As to the second question, the Board were representatives of those who were to pay. On the third and fourth questions, he might say that the value of the site for building purposes had not been reported to the Board, and he was not able to give any estimate as to the approximate cost.

Mr. Stephen Terry, Inspector for the Local Government Board, held an inquiry on Tuesday respecting an application made by the Town Council of Sutton Coldfield for sanction to borrow £3,000 for the purchase of a steam-roller, a fire-engine, for works of lighting, and for alterations to their offices. The borough surveyor, Mr. J. Fletcher, explained the proposals, to which no objection was raised.

Opposition having been raised by certain ratepayers of Fenton to the proposed payment by the local board of that town of £100 to the surveyor, Mr. S. A. Goodall, for extra services rendered in laying out the cemetery and carrying out the sewerage scheme, the local board got over the difficulty on Tuesday by voting the surveyor an increase of salary from £230 to £330 for the next twelve months.

On Wednesday an inquest was held at Camberwell on the body of Edmund Hawken, 74, a retired builder, lately residing at 67, Upland-road, East Dulwich, whose body was found on the railway at Nunhead on Sunday fearfully mutilated by a passing train. The deceased had never, his sister stated, threatened to commit suicide, and there was no reason why he should have committed such an act. The jury returned an open verdict of Found Dead.

The *Herts Advertiser* states that an ugly crack is visible above the eastern arch of the tower of St. Alban's Cathedral, both on its eastern and western face. It appears to the non-professional eye as though the south-east pier were sinking again. Possibly the alterations to the south transept have weakened it, or it may be that the increased weight in the tower is beginning to tell.

Our Office Table.

IN the September issue of the useful "A. A. Notes," Mr. H. D. Appleton, F.R.I.B.A., vice-president of the Association, announces that the approaching session commences on October 7. There are several new departures to which he calls attention. The connection between the Lectures on the History of Architecture and the Elementary Class of Design, which, during the last session or two, has been gradually dissolved, will this year be quite severed, and a course of lectures will be given, arranged in two divisions; the first, being devoted to Classic and Continental Renaissance Architecture, will consist of four lectures to be delivered by Mr. H. Stannus; the second will consist of three lectures on "English Architecture First and Last," by Mr. J. D. Sedding. It is to be hoped that this interesting course will attract a large audience, and be found of great value. The Class of Construction having during last session showed signs of waning interest on the part of its members, the syllabus has been varied to endeavour to raise the quality of the papers sent in, and to treat of the usual questions and duties which occur in everyday practice. The Colour Decoration Class will, this session, be formed under a slightly different name—as the Class for the Study of Ornament and Colour Decoration, and in an association which boasts of nearly eleven hundred members surely ten can be found to devote a few evenings a month to the study of so fascinating a subject as colour decoration. In response to suggestions received, an elementary division of this class will be formed for the study of decoration and colour. It is to be hoped that this new departure may meet with adequate support from the student members.

MR. WALTER EMDEN'S complaint that the building of the new Court Theatre near Sloane-square cannot be begun because the Metropolitan Board of Works are taking their vacation, and will not examine, still less pass, any plans till they meet in October, reveals a very substantial grievance. The plans were, Mr. Emden says, deposited for approval in July last, and when October comes the Board will probably take a month or two before they approve the drawings. In the mean time, the building season is passing away, while the whole of such work is brought to a standstill for two or three months, to the great loss and annoyance of architects, contractors, and building owners. It is difficult to understand why the authorities at Spring-gardens should not, during the holidays at least, delegate the duties of examining and approving plans to the officials in the architect's department, power being reserved to bring difficult or disputed points before a small vacation committee.

SIR J. C. ROBINSON returns in the *Times* to the charge against the repairs now in progress at St. Mary-le-Strand Church, and especially regrets the removal of the stone vases from the parapets, observing that they are an integral and indispensable feature in the general decorative scheme of the structure; they were certainly decided upon and placed with consummate judgment by the eminent architect who designed the church, and their removal would entail irreparable loss and disfigurement. "Is there," he asks, "no remedy against the tinkers and tailors, third-rate architects, hungry contractors, and speculators who seem to have got entire control of the ancient art monuments of the Metropolis?" The commonsense remedy for the overcrowded traffic in this narrow portion of the Strand would be, he suggests, to widen the narrow passage on the north side of St. Mary's Church by taking down some of the houses there, and opening out, rebuilding, and widening Holywell-street at the back. In this way the stream of traffic in the Strand would be divided into two branches, one passing by the north side through Holywell-street, the other along the south side of St. Mary's Church, as at present, and both re-uniting at St. Clement Danes, where already this precise arrangement holds good. Mr. C. Knight Watson comments on the suspicious silence of the persons responsible for the present works at the church under the charges and protests made, adding:—"This parish of St. Mary-le-Strand has already sold a piece of its churchyard to the

Metropolitan Board of Works for the widening of the street. Are they prepared to sell the rest, and the church with it? We have heard a good deal lately of charges against certain members of this Board. They are now under investigation, and we must wait. Is it possible that there is some quiet understanding between certain persons and the Board that the site of the church may be had cheap, for road purposes, if only the Board will do their part in proclaiming it dangerous? The matter may be a job, and to many of us it looks like one."

In another letter to the daily press, Sir J. C. Robinson reverts to the question of the action of light on water-colours, which, it will be remembered, aroused a heated discussion eighteen months since, and was laid to rest by the appointment by the Science and Art Department of two separate Commissions to make inquiries, one of scientific experts, the other of artists and directors of galleries. Neither Commission has shown any signs of life, and it is rumoured, he says, that the discoveries and conclusions of the scientists have been so adverse to the contention that "water-colours do not fade," and generally speaking so unwelcome to the upholders of that doctrine, that the artists' committee has never even been called together, or, at all events, has not as yet taken any action. He adds: "The matter is, however, of public importance, and in many respects even urgent. The general question of the influence of light on pigments is indeed a far-reaching one, touching many other things besides water-colour drawings; it cannot, therefore, be allowed to be dropped altogether, nor to be obscured by partial or biased expositions. A full and complete account and report of the investigations of the scientific Commission, unaccompanied by the glosses of official or professionally interested persons, is what is wanted. Upon this alone the public would doubtless be quite able to form correct conclusions on points heretofore in dispute, and also be made usefully acquainted with matters of far wider and more important range."

Even in regard to municipal regalia it seems that all that glitters is not gold. Some years since Mr. J. L. Ricardo, a former member of Parliament for Stoke-on-Trent, presented a massive chain and badge to the town council of Hanley for the use of successive mayors. For a time it made a brave show, but by degrees began to get shabby, and one occupant of the chair, Mr. Emery, had it "dipped" at his own cost in order to improve its appearance. This only stayed the inevitable wearing off of the plated surface, and the present and recent mayors have been so twitted about its increasingly tawdry appearance when attending functions in their official capacity, that they have hardly cared to bedeck themselves with it. At Tuesday's meeting of the town council, Alderman Powell made the gratifying announcement that Mr. Herbert Keeling, of Shelton Hall, had offered to present the borough with a new mayoral chain. He added that the donor of the present chain must have been very much deceived in its quality, as he would scarcely intend to give one of less purity than 18-carat gold, whereas the present one was of base metal thickly coated with gold. It goes without saying that the proffered gift was accepted with hearty thanks, and in future mayors of Hanley will have more inward satisfaction than in the past in contemplating themselves arrayed in the emblems of authority preparatory to appearing at state functions, lord mayor's feasts, or photographic studios.

Sir Frederic Leighton's "Last Watch of Hero," one of the leading attractions of the recent Academy Exhibition, has been purchased for the permanent collection at the Manchester City Art Gallery, and the president of the Royal Academy has presented to the Gallery his studies of drapery for the same work, which will be hung in two frames, one on either side of the canvas. The price paid for the "Last Watch" has not transpired. The Manchester Art Gallery Committee have also purchased from the Rickards' collection Mr. G. F. Watts's "Player." Both these works are hung in the autumn exhibition, which opened on Tuesday.

The autumn exhibition of the Royal Birmingham Society of Artists, opened on Tuesday, is this year of special interest. The president, Mr. G. F. Watts, R.A., contributes three pictures—a portrait of Sir Frederic Leighton; a study of a young knight, "Aspiration"; and an imaginative work, "The Spirit of the Ages." Mr. Watts also sends a bronze bust of "Clytie." The past-president, Mr. Burne Jones, A.R.A., sends the portrait of his daughter, recently on view at the Grosvenor Gallery. From this year's Academy Exhibition we again see Mr. H. T. Wells's historical picture of the Queen receiving the news of her accession to the throne; the Hon. John Collier's "Incantation," Mr. F. Calderon's "John Hampden," Mr. Small's "Last Match," and "Sindbad the Sailor," by Mr. Alfred Goodwin. Mr. Holman Hunt has promised his "Master Hilary," exhibited at the Grosvenor, and now being touched up, and other figure subjects are sent by Mr. J. E. Hodgson, Mr. J. C. Horsley, and Mr. Sant. Mr. E. H. Fahey shows in the water-colour room a number of his sketches on the Norfolk Broads, and other contributors are Sir J. D. Linton, P.R.I., Mr. H. S. Marks, Mr. Walter Crane, and Mr. John Fulleylove. The Birmingham Society of Artists, under whose auspices the exhibition is held, have just presented Mr. Henshaw, the veteran landscape painter, with an address expressing regret at his retirement from the office of treasurer, accompanying it with an album of sketches and studies by each of the members and associates of the society, enclosed in an oak case. The presentation was made by Mr. J. A. Chetwin, vice-president, and has been feelingly acknowledged by Mr. Henshaw.

The City and Guilds of London Institute have just issued the programme of the technological examinations to be held by them, or by local committees under their auspices, in the ensuing session 1887-8. The examinations are in two grades, the Ordinary intended principally for apprentices and journeymen; and the Honours for foremen, managers, and teachers of technology. Candidates may enter themselves for either grade in the majority of subjects. No candidate may be examined in the same year for more than one subject. There is no limit of age and no fee for examination; prizes of money, medals, and certificates are awarded to successful candidates. The subjects for next session are thirty-five, and include: Oils, painter's colours, and varnishes—examiner, Prof. E. J. Mills, F.R.S.; iron and steel manufacture, Professor C. Roberts-Austen, F.R.S.; pottery and porcelain manufacture, Mr. Gilbert R. Redgrave; plumbers' work, Mr. S. Stevens Hellyer; carpentry and joinery, Mr. Banister Fletcher, F.R.I.B.A.; and brickwork and masonry, Mr. John Slater, B.A., F.R.I.B.A.

Professor Tyndall, in a letter on lightning-conductors, points out that the abolition of resistance is absolutely necessary in connecting a lightning-conductor with the earth, and this is done by closely imbedding in the earth a plate of good conducting material and of large area. The largeness of area makes atonement for the imperfect conductivity of earth. The plate, in fact, constitutes a wide door through which the electricity passes freely into the earth, its disruptive and damaging effects being thereby avoided. A common way of dealing with lightning-conductors adopted by ignorant practitioners is, Dr. Tyndall remarks, to carry the wire rope which forms part of the conductor down the wall and into the earth below, where it ends without any terminal plate; such a "protection" is a mockery, a delusion, and a snare. Some years ago a rock lighthouse on the Irish coast was struck by lightning, when he found by the engineer's report that the lightning-conductor had been carried down the lighthouse tower, its lower extremity being carefully embedded in a stone, perforated to receive it. If the object had been to invite the lightning to strike the tower, a better arrangement could hardly, he believes, have been adopted. He vetoed the proposal to employ a chain as a prolongation of the conductor, as the contact of link with link is never perfect.

An epitome of the Merchandise Marks Law Consolidation and Amendment Act, which has just received the Royal Assent, has been issued by Mr. Edmund Johnson, F.S.S., manager of the Trade Mark Protection Society. The forging of any registered trade mark, or a mark calculated to deceive by its resemblance to a trade mark, is made an offence punishable by imprisonment and fine, with forfeiture of the article on which the forgery appears. An important feature of the Act is the proviso in Section 4 that in any prosecution for forging or falsely applying a trade mark, if the defence is set up that the forgery or false application was done by assent of the proprietors, then the burden of proof will lie on the defendant to prove the assent. In any prosecution a defendant and his wife, or her husband, may, if defendant thinks fit, be called as witnesses, and in the case of imported goods evidence of the port of shipment is *primâ facie* evidence of the place or country of production. No prosecution can be instituted under the Act after three years from the commission of offence, or one year from first discovery thereof, whichever first happens.

Mr. John Barratt, of Beeston Hill, Leeds, describes three suspension foot-bridges spanning the river Wharfe, erected by amateurs in Upper Wharfedale. Two of these are situate near Burnsall, and one near Grassington. The parent bridge is, he says, situated about half a mile below Burnsall, having a clear span of 110ft., with a footway about 2ft. wide, the whole structure suspended from two wire-rope cables about ¾in. diameter, stretched between rough hewn stone piers (built of boulders from the river-bed), and anchored at the ground levels to large stones buried about 5ft. deep. This bridge was designed and erected by a Dalesman, for the convenience of himself and family, to connect his pastures with his residence (Woodhouse Manor). The various wrought-iron parts were made by the village smith at Appletreewick; the cables were obtained from the abandoned lead mines in the neighbourhood; and the cost of the whole structure, ironwork, masonry, and wood, did did not exceed £30. The second bridge has a stretch of about 130ft., and spans the Wharfe a short distance above Burnsall. It was made and erected by a local blacksmith, who followed the design of the "manor" bridge, the piers, however, being formed of stout cast-iron pipes fixed on stone foundations. In a mechanical sense it is neither so handsome nor constructed on such scientific lines as its original. The other bridge in Grasswood is similar to the last described, but shows a superior knowledge of principles, both in design and in erection, doubtless gathered from experience previously gained. Should any readers care to see these novelties for themselves, a journey of about eight miles from Ilkley or Skipton is all that is needed; but this would amply repay the visitor, as he would pass through the heart of "the Arcadia of Yorkshire."

A pension is to be granted out of the Civil List to the widow of Mr. E. W. Godwin, F.S.A. The list of names in support of the petition is quite extraordinary, and testifies, the *Pall Mall Gazette* says, to the esteem in which the late Mr. Godwin was held by a great variety of persons. It is headed by three Dukes—those, namely, of Argyll, Abercorn, and Westminster. Lord Tennyson comes next, and after the Laureate the Marquises of Ripon and Hartington, followed by Earls Granville, Cowper, Lytton, Dufferin, and Dunraven, and Lords Wolseley, Ardilaun, and Curzon. Artists are represented in plenty, including the P.R.A., Sir Noel Paton, Sir John Millais, Mr. Boehm, Mr. Alma-Tadema, Mr. Long, Mr. Orchardson, Mr. W. B. Richmond, Mr. Poynter, and Mr. Whistler. Mr. Godwin's own profession of architect is well to the fore in the names of Mr. Waterhouse, Mr. Aitchison, Mr. Charles Barry, Mr. Cole Adams, Mr. Seddon, and half a dozen others. The signatures of M.P.'s include those of Mr. John Morley and Mr. Labouchere. All these apart, the list would still be a notable one if it contained none but the following, as representatives of literature:—Mr. Browning, Mr. Swinburne, Mr. William Rossetti, Dr. Todhunter, Mr. Theodore Watts, Mr. Buchanan, and Professors Newton, Sime, Yeats, and Thistlethwaite. Mrs. Godwin is certainly to be congratulated.

Another step towards the erection of the free public library, provided for Edinburgh through the liberality of Mr. Andrew Carnegie, was taken on Monday, when the Library Committee of the City Council finally adopted the revised plans of Mr. G. Washington Browne, their architect, and instructed him to advertise for tenders and appoint a measurer at a remuneration of 1 per cent.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1705.

FRIDAY, SEPTEMBER 9, 1887.

THE ARCHITECT: HIS RELATIONS TO THE BUILDER.

THE precise relation which the architect holds with regard to a contract, whether he ought to be considered only as an agent of his client or as an arbitrator between owner and contractor, is a question which is still rather perplexing whenever any dispute arises. A clear idea of the relationship is very necessary, as it not unfrequently happens the architect is called upon to decide in his capacity as arbitrator a point between the building owner and contractor. As our readers are aware, arbitration clauses, as they are called, are inserted in most building contracts, providing that in case any question, dispute, or difference shall arise between the employer or his architect and the contractor, such question or dispute is to be referred to the arbitration of some architect. We are of opinion that such a clause is sometimes necessary and fair towards both parties, though legal authorities, as a rule, raise objection to the clause being always inserted, and think it better that the employer and builder should be free to submit their differences during the progress of the work. It is said that arbitrations are costly and unsatisfactory, and so they are; for, as everyone knows, the contractor can question about this or that, and raise a quibble purposely, knowing that it will be referred to the arbitrator, or the employer, and the architect will gladly settle the matter in his favour to avoid the process. If, however, the deed makes it clear as to what questions are to be referred to an arbitrator, there can be very little to object to. Unfortunately this is not always the case, and the parties rush into law.

From what we have said there is strong grounds for affirming that the architect, in his present capacity between client and contractor, holds a threefold relation. He is an artist or designer, so far as he is engaged in the design of the building, an agent to the building owner in certain matters which bind him, and as regards disputes between the owner and the contractor an arbitrator as well. We will now refer only to the two latter capacities. There is some confusion about the matter. Can the architect bind the building owner or his principal by any act? Are his decisions to be taken as conclusive and final? And, first, as to the duty of the architect as an agent. When he simply prepares a design, he is certainly not an agent; but directly he undertakes to carry his design into execution, he has, by custom, an authority to act for his client. He has power to order quantities and to give instructions for certain things that appertain to the contract or work of which he has prepared plans. Still, there are some who say that an architect is not an agent. In Lord Grimthorpe's "Book on Building," a form of contract is given which distinctly provides that neither the architect nor the clerk of works in his absence "shall be considered for any purpose the agent of the committee, nor have any power to act contrary to their directions." The whole of the work shall be done to the satisfaction of the architect. "But the passing or certifying of any work by the clerk of works, or by the architect himself, shall not exempt the contractor from liability to replace the same if it be afterwards discovered to have been done ill, or not according to the plans and specification either in execution or materials." There are certainly two sides to the question. The employer who contracts has a right to have his work carried out well, and any inferior work made good, even though his architect has certified and passed the work; but then who is to judge, if not the architect, as to the proper execution of work? Many employers find fault with matters in which they have not the faintest notion of what is right, and it would be manifestly unjust to the contractor for the employer to be able to compel him to reconstruct or alter these. If an architect passes improper materials and workmanship he is certainly unworthy of the position he occupies. There will always be a hesitation amongst those who engage architects to allow them to exercise too much authority; it is for the profession, therefore, to endeavour to rectify abuses by having proper contracts drawn up, which, while giving them authority to act in matters appertaining to the design and construction, will afford them power to require the making good of work which has been discovered to be badly executed within a reasonable time after completion. If we allow that the architect is for some purposes the principal, it follows that he should have the option of determining questions that arise in the progress of the building. We can hardly see how he can act in one case unless he possessed the functions of a judge in certain questions.

But as we said just now, there are doubts about this question wherever the deed between the parties is not clear. Suppose, during the progress of a building, the builder finds something described in the specification contrary to the instructions given or details furnished by the architect. Is it to be referred to the arbitrator—supposing an arbitration clause introduced? Or, say an inferior quality of bricks has been used, can the architect insist upon the removal and substitution, or is that also to be referred? These are questions which arise in nearly all contracts. The architect is certainly the only authority who can with propriety decide in such cases. Contractors, however, have a right to be consulted, and the custom is now to introduce an arbitration clause, by which the contractor may appeal to the judgment of an independent architect. When such a provision is inserted too much attention cannot be given to its wording. We shall refer to one of these forms by-and-by.

Under many contracts the architect exercises the fullest powers. He is sole judge. He has to give certificates which cannot be examined, and are conclusive; he has to decide in any case of disagreement that may arise owing to any omission or any discrepancy betwen the drawings and specifications, or as to their intent and meaning, and he is virtually made by the deed an arbitrator, so that if there is a reference to him of matters in dispute between the contracting parties his decision is final and conclusive. We here quote a clause of exceptional power, which is sometimes found in contracts, relating to "extras": "In case the architect shall consider it desirable to order additional work, or to increase, alter, or diminish the quantities, or the dimensions, or alter the character of the works described in the contract, drawings, and specifications, such additions, diminutions, or alterations shall not in any way vitiate this contract, but shall be performed by the said contractor under all the conditions, stipulations, and responsibilities therein contained, in like manner as if they had been expressely described and included in the specifications and drawings." This clause is very stringent; but was used by the engineer of the Hastings Pier Company, who were defendants in the well-known case of "Laidlaw v. Hastings Pier Co." In this instance, the judge, Lord Coleridge, said, truly, the provision brought the execution of much extras within the contract, "and subordinated the contractors in their execution to the absolute and uncontrolled authority of the engineer, who could order them to be executed without delay.' It further provided that the value of such additions, diminutions, and alterations should be estimated according to a schedule of prices annexed. In this instance the judge said the certificates given were conclusive, the defendants being bound by them; but the contract went further, and provided that, if dispute or difference arose, the engineer was to decide, and his decision was to be binding on both parties.

The clause inserted in the heads of conditions sanctioned by the Institute of Architects refers all cases of dispute to the arbitration and final decision of an architect as a fellow of the Institute. Certain clauses are exempted from this rule, referring to matters left during the progress of the work to the sole decision of the architect. These exceptions relate first, to the provision of everything necessary and requisite for the due execution of the works according to the true intent and meaning of the drawings and specifications taken together, any discrepancy between them being decided by the architect; second, to the removal of inferior materials, the architect being vested with full power to require other proper materials to be substituted; third, the re-execution of bad work, in which the architect is to have also full power to employ other persons to do the work and to charge the cost to the contractor. Two important matters to which the arbitration clause applies are the certificates of the architect and the time of completion, both of which are questions that the architect is not always the most eligible person to decide. It may be argued that if the architect is to determine certain points reserved, he ought to be able to decide in other cases as well; but the wording of the clause makes it applicable mainly to all disputes, in which he himself is one of the disputants, "Provided always that in case any question, dispute, or difference shall arise between the employer *or the architect* on his behalf and the contractor," &c. Here it is clearly meant that the question must have arisen between the employer or his agent (the architect) and the contractor, and not simply a dispute between the employer and contractor, in which the architect is not a party. In other words, the architect may be no party to the dispute, in which case a reference is scarcely possible without the sanction of an architect. Thus, if an employer contend that the contractor is not entitled to a certificate, and the architect gives one, the employer is bound. A very important decision bearing upon the usual arbitration clause in building contracts ought to be mentioned here. We refer to the case of "Clemence v. Clarke," 1880, when Mr. Justice Grove gave judgment. It was argued in that case, if we remember rightly, that the architect's final certificate may, under certain circumstances, when, at least, there is an arbitration clause, be reopened. Mr. Justice Grove distinctly repudiated this idea. He showed that the clause applied to intermediate work. His words were: "But to what does the clause refer? To my mind not to disputes between the employer and his contractor, but between the employer and the architect on the one hand, and the contractor on the other. And who is the person likely to dispute the questions of the works having been completed? Why, I should think the contractor would be anxious to get his money. The contractor might allege that the works were completed when the architect says they are not; and in case of a dispute like that between the contractor on the one hand and the architect on the other (and this would appear a reason for the arbitration clause), where he enters into a dispute with the contractor, then he is not to be allowed to be a judge in his own case, and then a reference should be made; and in such a dispute as that the arbitrator is to be in the place of the

architect." Our readers will see that this distinction is important, and it places the architect in a better position in case of a dispute between himself and the contractor. On the contrary, if there is no dispute, and the architect makes his certificate, his award is final. After this clear distinction between the cases in which an architect has the right to determine, and those in which he has not, the relation subsisting between the architect and contractor is made tolerably plain. There are decided objections to making the architect the sole arbitrator in case of dispute, though it is often to be seen in documents which have been unwittingly signed by the contractor. The binding nature of the contract depends of course on the rigour of the architect, and the exacting nature of his demands.

A SOMERSET TOUR.

FEW districts in England are richer in the blending of natural scenery with architecture than Somerset. The general tourist will find plenty to interest him in the historical and geological aspects; but for the student of architecture there is an abundance of good examples of ecclesiastical work, and of a kind that differs in many important particulars from the architecture of the northern, southern, and eastern districts of England. The plentiful supply of good building stone in Somerset, especially of the oolitic variety, has been favourable to architectural style. Every period is represented; Norman and Transitional at Glastonbury Abbey, Early English and Decorated of the purest phase at Wells Cathedral, itself as perfect and complete a development of those styles as can be found anywhere, and Perpendicular as seen to perfection in Bath Abbey Church; indeed, these two cathedrals, in their integrity of plan and completeness are unsurpassed.

The main interest of Bath lies of course in its fine Perpendicular Abbey church. It can hardly be called a cathedral, though John de Villula's original Norman edifice is reputed to have been a cathedral of some extent, the nave of which equalled in size the present church. Professor Freeman has sketched very graphically the relation of the Abbey church with the church at Wells: how Bishop John removed his bishopric from St. Andrew's at Wells to the abbey church of St. Peter at Bath, which was an old Roman town, and a much larger place than Wells; how he rebuilt the church at Bath, and how badly he treated the monks there and dispossessed them. The church was founded by Offa for secular canons, though it was afterwards a monastery, and then, as we have seen, it became to be the bishopstool. The bishop was abbot in fact. This took place early in the 12th century. A subsequent bishop, Robert, became the bishop of Bath and Wells, and he it was who rebuilt the former church, though not the existing building, which is of much later date. Wells again became the favourite place, the bishops preferred it, and so Bath Abbey fell into ruin. The rebuilding was undertaken by subsequent prelates, and the present church was not certainly finished till early in the 17th century. As most of our readers know the edifice well, it will be superfluous to say that being almost the latest example of the last period of Gothic architecture, it is not one of the purest or best. A general glance at it is disappointing, though it is fair to say the interior surpasses the expectation formed by the exterior. Looking at the edifice again after many years, we can only express the conviction which others must have formed, that there is a great want of gradation between the details of the nave arcading and the highly elaborate fan groining of the nave and aisles. For instance, one is struck by the somewhat heavy wave mouldings unrelieved by fillets which make up the section of piers. The ogees are very large and the capitals exceedingly small, if not poor. The great interest in this edifice is that it is essentially a fine local example of a parish church, which has been lately, under Sir Gilbert Scott, adapted to congregational worship; also, it represents in a very complete form the great aim of the Perpendicular builders to increase the area of windows. The large size of the clerestory windows, and those lighting the nave, chancel, and transepts, entitle the structure to the appellation of the "lantern of England." The painted glass is very fine in the blending of colour. Worthy of notice are the very elaborate and varied carved bench ends, and we must also draw attention to a contrivance for improving the sound which probably not many visitors have noticed. Across the westernmost piers of the crossing, above the pulpit, prayer desk, and lectern, are stretched a series of fine wires secured to the members of the stonework, which are found to have materially aided the transmission of sound by breaking up the echo. Over the pulpit is stretched on these wires, which are all on the same level, a cloth canopy. For a large, lofty church, the hearing is good compared with many others. Externally, the blackened appearance of the masonry in the lower parts is one of the disfigurements to which stone is exposed even in the comparatively smokeless atmosphere of the city. It is much decayed on the south side, especially the clerestory and tower, where the perishable part is eaten away. The lofty flying buttresses become a necessity under the conditions imposed by so high a clerestory with such large windows. One peculiarity of the design is the oblong proportion of the tower on plan, owing to the very narrow transepts, which are only 20ft. wide. This does not add much to the general effect. Poverty in detail is apparent in a close examination; the aisle windows are by no means elegant in their arch curves and tracery, and the straight head above the great east window is a fault which its charming glass hardly atones for. The interior of the edifice is at least as perfect in its Late style as the interior of Salisbury, Exeter, or Wells.

The student of building stones of the Oolite formation will find Bath the great centre, and whatever may be said of the perishable nature of the Bath varieties of stone, its atmosphere is certainly more favourable to its preservation than that of London and the southern districts. In many of the houses and public buildings built of Bath stone worked at Combe, Box, Carsham, and Furley Down, we find weathering qualities that will stand examination, though in a few cases decay has taken place in the laminal lines when a kind of surface disintegration exhibits itself. Wherever decay appears it will be found the selection has been at fault, or the stone has been set on its wrong bed. Some of the earliest-built houses show very little decay. Pulteney-street, Bath, a fashionable quarter in the days of the latter Georges, is built entirely of the local stone, which, though discoloured and brown, has worn well. One of the secrets of successful treatment is to be observed in the avoidance of projections and decorative features in the quiet Classical style adopted. In the houses one seldom notices even architraves round the windows, and the stringcourses and cornices are small, the former mere flat bands. Several of the modern villas follow this treatment of the stone, and where decoration is found it often consists of incised ornament, as may be seen in some new villas on the Bathampton-road.

Leaving Bath by the Cheddar Valley route, a charming country is traversed by the Great Western Railway, affording the student a good study of the local architectural peculiarities of Somerset. The churches are mainly interesting for the noble Perpendicular towers, and of these we must especially mention the fine examples of Wrington, Axbridge, and Cheddar, belonging to one of Mr. Freeman's three types. The Wrington tower is a noble instance of massive, lofty belfry, which is seen to still grander scale at St. Cuthbert's, Wells, where the main portions or stages of the windows are left unpierced, leaving the vertical lines of the mullions and jambs in their severe simplicity. The Bristol type, with turret and spirelet at one corner, is also very effective, and commonly met with. At Axbridge, and again at Cheddar, is to be noticed a triple series of windows on the longest side, the centre one pierced; the latter tower is particularly large and handsome, and wider on one side than the other, the summit being crowned with the usual turrets. These towers are generally at the west end, and they completely stop the nave. For its grand and dignified tower St. Cuthbert, Wells, is unequalled. The lofty windows on the upper stage, two on each face, occupy more than half of the height, and being unpierced, except at the heads, resemble panels in two stages. Of the beautiful cathedral of Wells it is needless to say much. Mr. Freeman has written the best description of it in his interesting history of the Cathedral Church. The grand west front, with its storied niches of sculpture, will always remain uncertain as to its date. Professor Willis, we think, considered the front the latest part built; but both Mr. Freeman and Mr. Parker inclined to the belief that it was the oldest portion, that it was built on the earlier church, like the west front of Peterborough, the nave and choir being added since. We think there can be little doubt it is the earlier part, and that Jocelin was the builder. Dispute as to date is, however, of little importance. We look rather at the magnificence of the front—its quite French character; though Freeman thinks the other Early work rather more French, though peculiar to Somersetshire. Re-examining the noble front, we may remark that it is not a mere screen like the front of Salisbury; but a massive structure combining two western towers and a centre portal. The sharp, light grey marble shafts in the stories of buttresses against the warm coloured limestone lighten the whole up remarkably, and give a brightness to the façade. Of all the views of the cathedral, that from the south-east from the Shepton Mallett-road is the most picturesque. The peculiar panelled style of the Somersetshire towers is noticeable—strongly marked vertical lines predominating. French feeling is evident too in the simple and austere arcades, especially in the arrangement of shafts with the rectangular members, and also in the abaci of the capitals. The remarkable arrangement of inverted arches between the tower piers scarcely destroys the repose of the structure; the double curves gracefully unite with the pillars, to which they add so much strength, and the *tour de force* idea is rendered unique in its plan. Wells possesses a very complete set of conventual buildings not to be found elsewhere in this country, and we cannot leave it without noticing the excellent preservation of the stone, and the exceedingly cleanly and bright look of the interior—a credit in this respect to the ecclesiastical authorities.

THE BRITISH ASSOCIATION AT MANCHESTER.

THE fifty-seventh annual meeting of the British Association for the Advancement of Science was opened at Manchester on Wednesday in last week, the 31st ult., with a presidential address by Sir Henry E. Roscoe, M.P., in which he traced the progress of discovery and research in chemistry during the past fifty years. Among the multitude of

papers read in the various sections, we give abstracts of a few likely to be of special interest to our readers.

Full reports of the meeting will be found in the *English Mechanic* for Sept. 2 and 9.

THE INFLUENCE OF SILICON ON THE PROPERTIES OF STEEL.

Mr. T. Turner, the secretary of a committee, consisting of Professors Tilden and W. Chandler Roberts-Austen and himself, appointed for the purpose of investigating the influence of silicon on the properties of steel, presented his report to the Chemical Section on Friday. When the committee were appointed at the last meeting of the Association a series of experiments had already been commenced. That series had now been completed. A second set of observations in continuation of the work had also been commenced, and the results were so far advanced that it was hoped to publish details in a few months. The first series of experiments was undertaken to determine the effect of silicon on the properties of specially pure iron. The mechanical tests were conducted by Professor A. B. W. Kennedy, F.R.S., of University College, London, and duplicate experiments gave concordant results. It was seen that the relative hardness was not very greatly influenced by the proportion of silicon added. The general conclusions arrived at from the experiments made were submitted. On adding silicon, in the form of silicon pig, to the purest Bessemer iron, it was seen amongst other interesting results that the hardness increased with the increase of silicon, but appeared to be closely connected with the tenacity. The second series of experiments was not yet quite ready for publication, but they showed that manganese greatly modified the effect of silicon in producing shortness, and hence enabled the metal to be readily rolled and otherwise worked, even in the presence of several tenths per cent. of silicon. For the majority of the applications of mild steel silicon did not appear to be advantageous.

ACHIEVEMENTS IN MECHANICAL ENGINEERING.

In the Mechanical Science Section, the President (Prof. Osborne Reynolds), in the course of an address delivered on Friday, reviewing the achievements in mechanical science during the past quarter of a century, said there never had been a time in which mechanical revolutions had followed one another with such rapidity. In all the main departments of practical mechanics progress had been so rapid that appliances had been superseded long before reaching the term of their natural existence. As new departures since 1861 which had already established themselves, we had the telephone, the incandescent electric light, the dynamo, and the secondary battery, the gas engine and sewing machine, not to mention the bicycle. We had also the tin can and freezing machine and roller mills, as well as the machine gun and Whitehead torpedo. The era would be memorable, particularly in that district, by the commencement of the Manchester Ship Canal, for which there was no precedent in this country; the completion of the Tay Bridge, the Severn Tunnel, and the Forth Bridge, which had now attained its full height of 360ft., although otherwise not by any means fully formed. An important step had been brought about in the internal development of the steam engine, represented by the triple and quadruple expansion engines. The increase and spread of mechanical knowledge had also been remarkable, and the appreciation of applied mechanics had steadily increased. Of late years there had been almost a scramble to found new colleges to teach engineering or to introduce such teaching into existing colleges. Since 1867 Owens College had received gifts and bequests from engineers of upwards of £150,000. It was the same way at Sheffield and at Leeds, where an engineering school had just been founded by Sir John Hawkshaw and the engineers of the town, and again at Liverpool. To be hailed as one of the greatest inducements to keeping alive in engineering schools a real scientific interest in the practical work which was going on around was the introduction of what were now called engineering laboratories, in which students might familiarise themselves with the actual subjects for which the theoretical work was undertaken. In recent periods the encouragement given by the British Association to researches had led to many results of the greatest importance by the effect of example in calling forth aid from other institutions—that of mechanical engineers, for instance, which recently induced Mr. Towers to carry out his already celebrated research on the friction of lubricated journals, the results of which claimed notice as constituting one of the most important of recent steps in mechanical science. Such investigations it was now the function as well as the interest of mechanical laboratories to undertake, and thus what had hitherto been a great obstacle in the path of mechanical progress seemed in a fair way to be removed, and steady advance to be insured.

THE REGIME OF ESTUARIES.

The President of the Section, Professor Osborne Reynolds, read a paper on "The Régime of Estuaries and the Possibility of Small Scale Experiments." The object was to bring forward certain results and conclusions with respect to the action of water in arranging loose granular material over which it may be flowing. These results and conclusions were in the first instance arrived at during a long-continued investigation undertaken with a view to bring the general theory of hydrodynamics into accord with experience rather than with any special reference to this subject in hand; but they have since been to some extent made the subject of special investigation. The general conclusion was that the régime of each part of the bed as to maintenance in steady condition, lowering or raising at any time, depends solely on the character of the motion of the water, which, if straight and uniform, neither acquiring nor losing velocity, causes a uniform drift in the direction of the stream which keeps the condition steady. If the water is losing velocity it causes a depository drift, and raises the bed; if gaining velocity, it causes a drift and lowers the bed; while, if curved, the direction of the drift is diverted towards the centre of the curve, with its attendant effect of lowering the convex side and raising the concave side of the bed. The bearing of this conclusion on the inner estuary of the Mersey was discussed, and a method of experimenting was indicated which affords a ready means of investigating and determining beforehand the effects of any proposed estuary or harbour works—a means which, after what he has seen, Professor Reynolds thinks it would be madness to neglect before entering upon any costly undertaking.

THE MERSEY BAR.

Mr. W. Shelford, of London, read a paper on "Improvements of the Access to the Mersey Ports." The geographical position of Liverpool Bay was sufficient to account for the bar and the accumulation of sandbanks, but the sandbanks at the bar had not advanced seawards for a century, and a development of the Mersey navigation might be said to have commenced with the construction of the Manchester Ship Canal. The tide in Liverpool Bay had the great vertical range of 30ft. at spring, and the capacious natural tidal reservoir of the Mersey caused a strong local current into and out of the bay; but there was no external or along-shore current independent of this capable of removing heavy detritus to a distance, although the character of the bottom showed that the finer suspended matters brought down by the river were carried away and deposited in deep water. The reasons for the absence of such external current were evident, since the bay was not only considerably landlocked by the Welsh and Lancashire coasts, but almost directly opposite to it was that part of the Irish Sea where there was no perceptible current owing to the meeting of the branches of the Atlantic tidal wave which has passed round the north and south of Ireland. The great volume of the local tidal flow would be sufficient, if properly directed, to maintain a navigable channel at the bar. The fact that the same tidal flow, where directed by natural sandbanks, now maintained a channel about 6,000ft. wide at low-water springs, and from 24ft. to 48ft. deep for over nine miles from New Brighton, was adduced as a proof that the quantity of tidal water was sufficient to maintain such a channel. That it failed to do so now where the bar occurred (i.e., from 9½ to 11 miles from New Brighton) was sufficiently explained by the increase of the effective width of the channel at the bar from 6,000ft. to 23,000ft. The author found that the sectional area of the low-water channel from New Brighton to the bar was tolerably constant, as might be expected from its being formed and maintained by a constant flow of water through yielding materials. He considered that a channel formed through the bar by dredging would not be self-maintaining on account of the tendency of the flood tide to break through the sides, and so to keep open subsidiary channels, which would rob the main channel. He would suggest only such works as would comply with the following essential conditions:—(1) The least possible interference with the present tidal currents of the bar; (2) the increase of the Burbo Bank; (3) the concentration as far as possible of the flood and ebb streams in one channel. The author would restrict the width of the low-water channel over the bar by extending the natural sandbanks seaward. To do this he would deposit moulds of rough stone, protected where necessary by larger blocks. The works need not be carried to a greater height than 4ft. above low water and spring tides.—Mr. Abernethy, of London, said it could not but be regarded as an extraordinary fact that at the present day the Liverpool bar should exist, especially having regard to the circumstance that the problem of removing bars had already been solved and practically carried out. At Aberdeen the bar had been removed by dredging, deepening the channel of the river Dee within the tidal estuary, and by embanking and increasing the hydraulic depth throughout the channel proper. In 1851 he sounded the bar at the River Tyne, which was done away with by similar operations. Like results were obtained on the Tees, and in the case of the River Danube draining works and dredging had secured the object in view. Great results had also been gained by the same process in the Mississippi river. If works similar to those constructed at the mouth of the Danube and at the Mississippi were carried out in the case of the Mersey, the same results would follow, and the bar would be permanently removed. A new phase had now been introduced into the matter, inasmuch as the Manchester Ship Canal would be before long an accomplished fact, and it would then be to the interest of the promoters of that great work and the various ports to unite in carrying out works which would enable vessels of the largest class to come into the Mersey at all states of the tide. Mr. Wheeler corroborated Mr. Abernethy. The port of Dublin was an instance in which, by building training walls in order to concentrate the whole force of the tidal scour at the bar, the obstruction had been removed. Mr. Shoolbred said it was satisfactory to know that a great many tidal authorities were in direct support of the proposals of Mr. Shelford. Mr. Price Williams urged that Liverpool and Manchester engineers should combine to carry out the removal of the bar of the Mersey. Sir James Douglas remarked that there was nothing for it at Liverpool but to have training walls and dredging. Mr. Daniel Adamson was of opinion that by fixing a training wall to the corner of the Cheshire shore they would by the greater velocity of the outgoing current sweep the bar into the sea.

THE MANCHESTER SHIP CANAL.

Mr. E. Leader Williams read a paper describing the Manchester Ship Canal. He said the length of the canal would be 35½ miles, and vessels would pass through in about eight hours. The banks would be principally of stone, and railways in all cases would be placed over the canal at a height of 75ft. above the water. There would be docks at Manchester, but they did not intend to let the municipal authorities fill them up with sewage.

THE SEVERN TUNNEL.

Mr. B. Baker read a paper written by Mr. T. A. Walker (contractor for the Manchester Ship Canal) on the subject of the Severn Tunnel. He gave explanations with regard to the engineering difficulties that were met with in the construction of the tunnel, and said that during the six months that had elapsed since its opening for passenger traffic not the slightest hitch has occurred in working it. The speed of the trains has often been as much as a mile a

minute. The ventilation has been perfect, and the relief to the traffic between South Wales and the south-west of England has been very sensibly felt; this traffic will no doubt, with the accommodation afforded by the tunnel, be greatly increased when the trains from London to South Wales run direct through the tunnel, instead of as at present by Gloucester.

THE FORTH BRIDGE.

Mr. A. S. Biggart read a paper on the Forth Bridge works. The progress made in the past two years was described, Mr. Biggart dealing particularly with the erection of cantilevers. The experience gained from the work of erection already completed had assisted greatly in enabling the promoters to prepare the plant for future work; and after full consideration Sir John Fowler and Mr. B. Baker, the engineers, and Mr. Arrol, the contractor, felt warranted in adopting another principle for erection of the next lay of cantilevers. Cranes, some at high altitudes above the work, and light cages and platforms would be the distinguishing feature of the new method. A discussion arose regarding the effect of air on workmen at such a great altitude. Mr. Bartlett explained the precautions taken to prevent accident. Mr. Glaisher, Sir Jas. Douglas, Sir F. Bramwell, and Sir Douglas Galton were among those who joined in the discussion.

MANUFACTURE OF PORTLAND CEMENT.

Mr. F. Ransome, in a paper on the manufacture of Portland cement, described the method generally adopted up to the present time, which he designated the "kiln process," and pointed out the several defects inherent in it. He then proceeded to describe a method that he has devised and patented which is free from the defects alluded to. Its main features consist in burning the materials of which the cement is composed in the form of powder instead of in lumps, and he demonstrated the economy of capital, space, time, fuel, &c., insured thereby. He next gave a statement of facts bearing upon these results, illustrating his method by diagrams of the apparatus as devised, and exhibiting samples of the material employed, with sections of some briquettes produced therefrom, and a table of the tensile strains to which they have been subjected. He concluded by alluding to further developments and the utilisation of other materials capable of producing excellent cement, which cannot be accomplished economically by the "kiln process."

THE ANTIQUITY AND DEVELOPMENT OF MAN.

In his opening address as President of the Anthropological Section, Prof. A. H. Sayce dealt with the evidence of the history and development of mankind afforded by the study of language. He held that the chief distinctions of race were established long before man acquired language—indeed, it was difficult to believe that man had known how to speak for any very great length of time. On the other hand, the Semitic languages afforded a conspicuous example of the fact that languages might remain fixed and almost stationary for a long series of generations. He once calculated that from 30,000 to 40,000 years was the utmost limit that could be allowed to man as a speaking animal. While the Asiatic origin of the Semitic languages was beyond dispute, scholars had of late years been coming more and more to the conclusion that Europe was the cradle of the Aryan tongues. Professor Schrader proved that the speakers of the parent Aryan must not only have lived in a cold climate, but that they must have lived in the stone age, with the skins of wild beasts only to protect them from the rigours of the winter, and nothing better than stone weapons with which to ward off the attacks of savage animals. The primitive Aryan was acquainted with fire; he could even sew his skins together by bone needles, and could possibly spin a little with the help of rude spindle-wheels; but beyond that his knowledge of the arts did not seem to have extended. The community to which he belonged was esentially that of pastoral nomads, who changed from season to season the miserable beehive huts of matted mud in which they lived. They could count at least as far as a hundred, and believed in a multitude of ghosts and goblins, making offerings to the dead, and seeing in the bright sky a potent deity. The fair Scandinavian race was the modern descendant of the race which spoke the parent language of the primitive Aryan community, and left traces of itself in the Scandinavian kitchen-middens. The determination of the several racial elements in these islands was particularly difficult, on account of the intermixture of population; and nowhere was the difficulty greater than in the case of the Celtic portion of the community. Long before the Roman Conquest the intrusive Aryan Celt had been intermarrying with the older inhabitants of the country, who doubtless belonged to more than one race, the result being that the so-called Celtic race was an amalgamation of races differing physiologically, but dominated by a common moral and intellectual character.

Canon Isaac Taylor read a paper, in which he argued that the origin of the Aryan race was to be sought not in Central Asia, but in Northern Europe.

THE ARRANGEMENT OF MUSEUMS.

A joint meeting of the Biological and Geological Sections was held on Friday to discuss the question of the arrangement of museums. Dr. Henry Woodward, F.R.S., President, opened the debate, and remarked that the question how a natural history museum should be arranged might seem to the uninitiated a very simple matter, but it was one which had occupied the attention of many of the most able naturalists during the past 50 years, and still remained with many a subject of widely divergent views. There were certain principal methods which might be seen followed out in the most of our large museums. He submitted that in public museums the specimens should be so arranged as to render them attractive to and easily to be comprehended by the public at large, who help to support these institutions. This could not be done by mixing the whole of the fossil and recent forms together. In a large museum immense advantage would, he thought, be gained by placing the collections of recent and fossil forms in each great group in near proximity to one another. In the subsequent debate Prof. Haddon maintained an opposite point of view to that taken by Dr. Woodward. The fundamental mistake into which most museums run was in having too many specimens for professional purposes. The tendency should be to cut down the number of specimens in public museums, and to afford the student every possible facility. The discussion was continued by representatives of both biology and geology, including Professors Hughes, Seeley, Traquair, Boyd Dawkins, Sollas, and Hartog, Dr. John Evans, Dr. Carruthers, Mr. Hoyle, Dr. Carpenter, and Dr. Haughton. The general conclusion was that some *modus vivendi* should be sought and found between the two extreme views, and that it was as foolish for the student of recent forms to neglect fossil forms as it would be for the palæontologist to ignore the knowledge gained from observation of living phenomena. It was said by Prof. Dawkins that there was no one method by which geological museums could be arranged. They must be arranged with a view to the needs of each place. The conditions of Manchester were wholly unlike those of London. In that city there was no possible opportunity of arranging or accumulating such vast collections as were found in the Metropolis, and they had to do what they could to have the various departments of nature represented in a natural history museum. How could they do that best? By doing it in the most simple fashion. The arrangement which they had resolved to carry out in the Owens College Museum was as follows:—Mineral kingdom shown below (the beginning of all things), mineralogy, petrology. Then above that they would treat of the history of life on the earth, animal and vegetable, and in that way they would be able to build up the history of the earth in a graduated order, from the beginning of the stratified rocks down to modern times. Botany and zoology came under the heading of history of life on the earth. They branched naturally from the study of things which have been to what we have.

IRRIGATION OF LOWER EGYPT.

A scheme for this purpose, which was explained by Mr. Cope Whitehouse, is to make a reservoir of the Raiyan Basin which would fill at high Nile, thus preventing the excessive rise of the river and providing for the season of drought. The Raiyan Basin is a depression to the south and west of the Fayoum, its northern extremity nearly on a line with Beni-suef, 73 miles south of Cairo. Less than £1,000,000 would suffice for the works, and the revenue afterwards to be derived would amount to about £2,000,000. The works would add one-third to the available resources of Egypt. Papers in supplement of the scheme were read by Col. Ardagh, and on behalf of Capt. Conyers Surtees and Capt. R. H. Brown.

EGYPTIAN MARBLES.

The mountainous country between the Nile and the Red Sea was the subject of a paper by Mr. E. A. Floyer, of the Khedivial civil service. One point mentioned was that the fine porphyry on Jebel Zeit, quarried in 147 AD. by Epaphroditos, was last year reopened by Mr. W. Brindley, of London. The next paper was by Mr. Brindley, who described a journey to the quarries in question. The Romans in taking porphyry from these quarries carried the blocks to the Nile, a distance of 96 miles. Now the porphyry will be conveyed by a gentle incline to the Red Sea, 25 miles distant. We shall publish Mr. Brindley's paper in full next week.

PROTECTION OF STONEHENGE.

The Association have passed the following resolution:—"That the Council be requested to consider the advisability of calling the attention of the proprietor of Stonehenge to the danger in which several of the stones are at the present time from the burrowing of rabbits, and also to the desirability of removing the wooden props which support the horizontal stone of one of the trilithons; and in view of the great value of Stonehenge as an ancient national monument, to express the hope of the Association that some steps will be taken to remedy these sources of danger to the stones." With regard to this resolution, the Council reported that "they had carefully considered the question, and having had the advantage of perusing the detailed report recently prepared by a deputation of the Wilts Archæological and Natural History Society on the condition of the whole of the stones constituting Stonehenge, are of opinion that the proprietor should be approached with the expression of a hope that he will direct such steps to be taken as shall effectually prevent further damage."

EGYPTIAN SCULPTURES AND PAINTINGS.

Mr. W. M. Flinders Petrie read in the Anthropological Section some "Notes on the Accuracy of the Sculptures and Paintings of Races on the Egyptian Monuments." He showed numerous plaster casts of bas reliefs and line drawings, mostly in profile, and of a very early period, representing faces of Egyptian character and of types characteristic of neighbouring nations of antiquity. These casts had been prepared from fragmentary architectural remains by means of paper "squeezes," which consist of moist slabs of paper which may be beaten into the grainings and indentations of the stone. When the "squeeze" is dry it may be removed, and impressions taken from it or any suitable material. The copies thus made are well adapted for photographic purposes, as they may be arranged in a more favourable light than might be possible in the hardly accessible positions in which the originals are often found. Photographs taken from the mouldings were exhibited. A companion paper was called "Studies on some Groups of Mr. W. M. Flinders Petrie's Casts and Photographs of Ethnographic Types from Egypt," and was read by the Rev. H. G. Tomkins. He hazarded a number of conjectures identifying place-names familiar to Egyptologists with localities bearing similar names to-day. He spoke of the wonderful Pun people, and described a set of terraces built by them, the walls of which rose by successive gradation to the height of 3,000ft. He also made reference to the pre-Scriptural history of the Hittites.

LONDON AND SOUTHWARK SUBWAY.

Mr. J. H. Greathead read a paper on "The City of London and Southwark Subway," of which he is the engineer, and which, he said would be three miles in length. The total cost of the line from beginning to end, including land, buildings, stations, and equipments, would not exceed £200,000 per mile. Steam locomotives were not to be used on the line, which

is to be worked on the endless cable system of traction.

ELECTRIC LIGHTING.

Mr. Georges Forbes delivered in the Free Trade Hall on Saturday night a lecture to working men on the subject of "Electric Lighting." Mr. Forbes, whose lecture was illustrated by numerous experiments, explained how light was created by electricity, and spoke of the various lamps in use. The arc used, he said, was the best for large spaces, and the incandescent for small buildings and houses. The incandescent lamp was safe, cleanly, and healthy—safe, because it could not set fire to inflammable objects and could not explode like gas; cleanly, because it had no noxious gases to tarnish silver and decorations; healthy, because it did not heat or pollute the atmosphere. The lecturer explained how electricity could be best generated for the purposes of lighting, and dealt with the difficulties attending it distribution through a large district from a central station. The only method that had been a success was the system of using an alternative current of high pressure in the mains and converting it by a specially-designed apparatus into a low pressure at the lamps. This system was founded on Faraday's discovery of induction, and it was being largely used in America and Europe. The lecturer proceeded to lay before his hearers a system for the construction of main conductors through the streets, and, finally, produced a meter by means of which the amount of electricity consumed by each customer could be measured. Mr. Forbes proceeded:—In conclusion, let me say a few words on the progress of central-station electric lighting in this country. It has been extremely slow, owing largely to the Electric Lighting Act of 1882. If electricity be put on the same terms as gas, and if you have your station on a river bank or any place where coal and water are cheap, you can be well supplied with electric light at the same price as gas, at 3s. a thousand feet, with a fair profit to the promoters. On the Continent of Europe there are numerous central stations. In America there are 250 central stations in different towns, and the progress has been enormous. At present there are probably more than 300,000 arc lamps in use in that country. The Americans are also getting the start of us in electric railways and tramways and generally in the application of electricity to motive power. We once beat the whole world in steam railways. Our pre-eminence in steam has gone far to make this country what it is. So let it be with electricity, for we are now passing into the age of electricity.

PREHISTORIC MAN IN GREAT BRITAIN.

The report of the committee, consisting of Sir John Lubbock, Dr. John Evans, Professor Boyd Dawkins, Dr. Robert Munro, Mr. Pengelly, Dr. Henry Hicks, Dr. Muirhead, and James W. Davis, appointed for the purpose of ascertaining and recording the localities in the British Islands in which evidences of the existence of prehistoric inhabitants of the country are found, was read before the Anthropological Section on Tuesday. It stated that the objects sought to be attained by the committee consisted in recording and mapping the prehistoric remains of Great Britain. The committee had arranged to secure the assistance of one or more competent persons representing certain areas—districts or counties, who recorded the occurrence in that area of any prehistoric objects which had been or might be found.

MIGRATIONS OF PRE-GLACIAL MAN.

Dr. Henry Hicks read a paper before the Anthropological Section on Tuesday, which raised an animated discussion. His subject was the "Migrations of Pre-Glacial Man." Referring to the further researches carried on this summer at Cae Gwyn Cave, North Wales, Dr. Hicks stated that the additional evidence obtained proved most conclusively that the flint implement found there last year—a beautiful flint-head—in association with the remains of pleistocene animals, was under entirely undisturbed glacial aspects. It proved another link in the chain of evidence which, so far as it went, pointed to a migration of man to this country from some northern source, as the human relics found in the caverns and also in the older river gravels—which Professor Prestwich was now disposed to assign also to the early part of the glacial epoch, when the ice sheet was advancing—occurred in association with the remains of animals of northern origin. There was not a relic to show that man reached this country with animals of an eastern or southern origin. Evidence pointed to a northern source as that from which man came to this country. He followed the reindeer in their compulsory migration, and kept mainly with them near the edge of the advancing ice. The age of this pre-glacial man must be many thousands of years—as many, according to one great authority, as 240,000 years.—Professor Boyd Dawkins protested in the strongest manner against Dr. Hicks applying the term pre-glacial to palæolithic man alone; and for this reason. The story of the existence of the earliest man was a story not only told in the river beds and caverns of Wales and France; but a story told us in lands far out of the reach of the reindeer or any other northern animal, and in lands in which there was no shred of proof that there was any glacial period at all. In North Africa, Palestine, India, and elsewhere, where there was absolutely no glaciation, where was found palæolithic man, we found the same remains with him as in glaciated Europe. He objected, therefore, to the application of "glacial" in order to fix any special period for the existence of the earliest man. He proceeded to adduce evidence, based upon the distribution of the remains of animals, to show, or at least to suggest, that the birthplace of man was a warm country, and that his migration was from the south to the north. Man, he said, made his appearance in Europe along with the southern animals, and when the cold came on he went south; and from the whole distribution over Europe, Asia, and Africa he must have been in possession of these areas during greater periods of time. He maintained, also, that there was evidence to show that, instead of the Esquimaux being, as Dr. Hicks thought, the ancestors of the people of our islands, they were the descendants of the men who migrated from the south to the north. Mrs. Stopes, of Upper Norwood, London, pointed to a carved shell found a few years ago in the red crag at Walton-on-the-Naze, as affording, in her opinion, absolute proof of the existence of man in this country at a period anterior to the glacial epoch. Several speakers dissented from the views which Dr. Hicks had brought forward. Evidence of the existence of a pre-glacial man was now indisputable.

BUILDING MATERIALS.—III.*

(*Continued.*)

By W. Y. Dent, F.C.S., F.I.C.

HYDRAULIC CEMENTS.

THE first hydraulic cements made in this country were obtained by burning natural cement stones, a patent having been taken out in 1796 for the preparation of what was improperly termed "Roman" cement from the calcareous clay nodules known by the name of septaria, which are obtained in considerable quantities on the Kentish and Essex coasts, the chief supplies being procured from Isle of Sheppey and the neighbourhood of Harwich, where they are dredged up from the sea at low water. The composition of these nodules varies considerably, but they may be regarded generally as consisting of from about 50 to 65 per cent. of carbonate of lime associated with argillaceous matter containing oxide of iron. The Mulgrave cement made at Whitby from stone found on the east coast of Yorkshire, the Medina cement from the Isle of Wight, as well as various quick-setting cements made in different parts of the country, may be regarded as more or less partaking of the same character as the so-called Roman cement. The operation of burning these natural cement stones is a very simple one, but requires care and experience, the object sought to be attained being to drive off the carbonic acid from the carbonate of lime, and to cause the silica of the argillaceous portion of the stones to enter into combination with the lime, forming silicates that are capable of being readily attacked by hydrochloric acid. To effect this a very high temperature is not necessary, and should, indeed, be avoided, for many of these natural stones, if exposed to the same temperature as that which is employed in the manufacture of Portland cement, would undergo partial vitrification, and would no longer, when mixed with water, possess the setting properties of cement. The stone is burnt in a kiln worked on the intermittent system, and afterwards ground to powder, the quality of the cement depending upon a proper selection of the stone and the care taken in firing. The trade in Roman cement was at one time of so much importance that the question was raised whether foreign vessels should be allowed to dredge for the stone off the English coasts; but partly owing to increased supplies of material from which cement answering all the purposes of the original Roman can be prepared, but chiefly to its having been superseded by Portland cement for all purposes where strength and durability are required, the Roman cement manufacture has ceased to possess any especial interest. The cement known as Portland, which was so named from a fancied resemblance of blocks of this material to Portland stone, far exceeds in importance every other description of cement, both as regards the extent of the manufacture and the purposes to which it is applied. A patent was taken out for the manufacture of this material, in the year 1824, by Mr. Jos. Aspdin, a Yorkshire bricklayer, who states in his specification that he mixes powdered limestone and argillaceous earth in a fine state of division with water, then evaporates the water, and calcines the mass in a furnace until the carbonic acid is entirely expelled, and this is essentially a description of what is done at the present time. This was not the first attempt at the artificial preparation of hydraulic cement, inasmuch as so far back as 1810 a patent was granted to Edgar Dobbs for burning a mixture of lime, clay, or any earthy material for the manufacture of cement, and in 1818 another patent was taken out by Maurice St. Leger for the use of a mixture of chalk or lime with clay or any substance consisting of silica and alumina; this mixture was to be made into a paste with water, dried, and burnt in a kiln. For some time prior to Aspdin taking out his patent, the well-known French engineer, M. Vicat, had been engaged in carrying out a series of experiments on the subject of hydraulic limes and cements, and an investigation of the subject was also undertaken by General Sir Chas. Pasley in 1826 at Chatham, who, in the course of his experiments, was the first to make use of the Medway blue clay, which has since been the principal source of the supplies of silica and alumina required for the manufacture of Portland cement in the chalk districts. It is a curious fact that in the early attempts to prepare Portland cement from artificial mixtures of clay and chalk, great care was taken to avoid too high a temperature in the kiln, and the light-coloured underburnt pieces (such as are now returned back to the kiln to be more thoroughly calcined) were regarded as yielding the best cement. The first to establish works on the Thames for the manufacture of Portland cement was Mr. Frost, who, about the same time that General Pasley commenced his experiments, erected kilns at Swanscombe, which were subsequently transferred to Messrs. White Bros., who have since that time continued the manufacture. Some time afterwards a son of Mr. Aspdin established works in the same neighbourhood at Northfleet, a place that is now almost entirely devoted to the cement trade. For some considerable time the quantity produced was very small, whilst the quality produced was variable, and could not be depended upon, and so little was the new cement appreciated, that in 1833, whilst Roman cement was selling at 1s. 6d. per bushel, only 1s. could be obtained for Portland. The trade has now become an important branch of national industry, every year new works are commenced, or old ones enlarged and supplied with new and improved machinery for saving labour, the demand for the article keeping pace with the increased supply. English makers are now so closely pressed, both as regards quality and price, by their German competitors, that it is only by exercising the greatest economy, and the production of the best quality, that they can hope to succeed in maintaining their position. The valuable qualities of this cement were early appreciated by the French engineers, and a large quantity of English-made cement

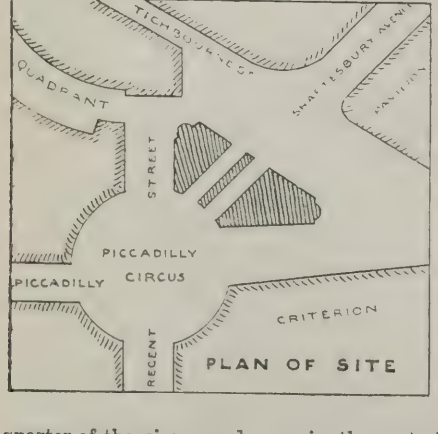
* Being the Cantor Lecture delivered before the Society of Arts.

was employed in the construction of the French docks and harbours. The greater portion of the cement made in this country is manufactured at the numerous works situated on the Thames and the Medway, the materials from which it is prepared being simply chalk and clay. The upper chalk, or that in which flints most abound, is that which is employed on the Thames, the grey chalk which lies immediately below it being also used on the Medway. The clay used for mixing with the chalk is obtained by dredging at low water on the banks of the Medway. Care must be taken in obtaining it that it is free from sand, and that it contains no fibrous vegetable matter; in the condition in which it reaches the works it contains about 40 per cent. of water. There is nothing very peculiar in the composition of this particular clay that should render its use essential for the manufacture of good Portland cement, the gault clay, as well as other descriptions of clay, being applicable for this purpose; any unctuous clay in which the proportion of alumina is considerable, that is free from sand and other impurities, and is capable of being reduced to a fine state of division, can be used for the manufacture of Portland cement. The clay and chalk in the proportion of three parts of the upper chalk or four parts of the grey chalk to one part of clay are thrown together, with a quantity of water, into a wash mill, which consists of a large circular trough (varying somewhat as regards character and size, but being generally about 18ft. in diameter) in which the mixture is ground by means of a revolving beam to which heavy bars of iron are attached, to the condition of a fine semi-fluid mud, or "slurry," as it is termed. The slurry is then pumped up to be further ground, either between rollers or by horizontal stones, and passed thence to the drying floors. Until within the last few years, a very much larger quantity of water was put into the wash mill than is now generally the case, the slurry being pumped up into reservoirs or "backs" (as they are termed), where it remained until the mixture of clay and chalk held in suspension by the water had deposited, when the supernatant water was drawn off, and the slurry, as soon as it had attained sufficient consistency, had to be wheeled away in barrows to the drying stoves. This system necessarily involved a great deal of manual labour, besides a considerable loss of time, several weeks being required to allow the particles of clay and chalk to subside; this method was, moreover, not conducive to the uniformity of the mixture, owing to the tendency of the heavier particles to deposit before those which are lighter. It is now the custom in most works to put only just enough water into the wash mill to make the slurry of a sufficiently liquid consistency to allow of its being removed by pumps. The drying of the slurry, instead of being conducted as formerly in special ovens heated by coke, is now carried out in chambers erected on a level with the top of the kiln, these chambers being heated by the waste gases from the kiln as they pass on to the chimney. The kilns in which the cement is burnt are closed at the top, the products of combustion being carried through the chambers containing the slurry, so that, as soon as the burning of a batch of cement in the kiln has been completed, a further quantity of slurry is sufficiently dried for another charge, and as this is already on a level with the top of the kiln, the operation of filling the kiln is facilitated. The kilns ordinarily employed for burning cement are somewhat similar in their construction to those used in burning lime, and are generally worked on the intermittent system, the difficulty experienced in working ordinary kilns continuously being quite as great in the case of cement as it is in burning lime. The Hoffmann kiln, which is largely used in Germany for cement, has not been adopted to any extent by English manufacturers; this may, perhaps, be partly accounted for by the fact that, in the chalk districts, the dry slurry is always, to some extent, in the condition of dry powder, whereas the materials for German cements are generally mixed dry, and moistened with water, and then made up into bricks before firing. The object to be attained in burning cement is not merely to drive off the carbonic acid from the chalk, and to effect the transformation of the silica of the clay from an insoluble into a soluble condition, but also to bring about those combinations of silica, alumina and lime, which require a very high temperature for their production, giving rise to a hard, almost semi-vitrified clinker. So far from being injured by being exposed to a very high temperature (as is the case with natural cement stones), Portland cement cannot be manufactured of full strength without being subjected to such a temperature, although it must not be so great as to produce actual fusion, for under such circumstances the material would be useless for cement. The conversion of the silica of the clay into a soluble condition will be found to have taken place in the half-burnt, yellowish pieces of cement that are returned to the kiln to be re-heated, in which even some of the chalk is not calcined. The difference between a lightly-burnt cement and a well-burnt clinker would appear to be due to the action of alumina, and the part it plays in the formation of double silicates of alumina and lime, and aluminates of lime. It was shown by M. Frémy, many years ago, that aluminates of lime obtained by subjecting mixtures of pure alumina and lime (consisting of one equivalent of alumina with one, two or three equivalents of lime) to a very high temperature produce, when mixed with water, hydrated aluminates of lime, which not only possess the property of hardening under water, but are capable of binding together very large quantities of sand into a mass possessing the hardness of stone. In the lias districts in Warwickshire, the limestone (which is of a harder description than chalk), and the shales which take the place of mud, are passed through toothed rollers and ground to a fine powder by horizontal stones. The powder is mixed in a pugmill, with as much water as is necessary to form a soft paste of sufficient plasticity to be capable of being separated into pieces about the size of bricks, which, when dried, are ready for the kiln. When drawn from the kiln, the calcined cement is crushed between rollers and ground to a fine powder by horizontal stones of the same description as those used in flour mills. Since it is necessary, in order to obtain the strong cements now demanded, that the mixture of chalk and clay should be heated to such an extent as to bring it into the condition of a hard clinker, the question of its being sufficiently ground has become one of great importance, on account of the difficulty experienced in reducing such a hard material to a very fine state of division. Unless the cement be ground fine its binding properties cannot be developed, and the quantity of sand it will bear mixing with is diminished. The coarse particles of cement which will not pass through a 50-mesh sieve are totally inert as a binding material; they will not even adhere together, although they may be converted, by simply grinding to powder, into an excellent cement. There can be no doubt but that the finer a cement is ground the better it is; it would, however, be manifestly impracticable to reduce a hard, well-burned clinker to an impalpable powder; the fineness must be limited by the cost of grinding. A few years ago a cement was thought to be sufficiently ground if 80 per cent. would pass through a 50-mesh sieve; now, however, it is required that 90 per cent. should pass a 76-mesh sieve, or 5,800 meshes to the square inch. When ground, the cement is conveyed to a store (the results of several days' grinding being mixed together so as to insure as far as possible uniformity throughout the bulk), where it should remain for three weeks or a month before being issued. However well made a cement may be, yet if it be mixed with water too soon after grinding, heat is generated, and it is liable to swell and crack; hence the necessity of making up small blocks, and observing whether any rise of temperature takes place on the addition of water, and whether, subsequently, any cracks make their appearance. Cement, to set properly, requires an ample supply of water, and will sometimes, if applied to a very dry wall, not adhere to it properly from deficiency of water. It would appear that the benefit derived from immersion in water continues for a considerable period, judging from an experiment made with two briquettes of the same cement, one of which was kept three years in the air, and the other in water. The one which had been kept in water gave the highest breaking strain, had a more crystalline fracture, and contained more water in chemical combination than the briquette that had been kept in air for the same period. The great improvements that have been made in the manufacture of Portland cement within the last twenty-five years owe their origin in a great measure to its having been employed in the construction of sewers for the metropolitan drainage, under the superintendence of Mr. Grant, who, with the view of obtaining the best possible article that could be manufactured, devised certain definite tests by which the quality of supplies could be controlled. The terms of his first specification were "that it should weigh 110lb. per striked bushel, and that briquettes made up with water having a minimum area of 2½ square inches, after immersion in water for seven days, should not break under a tension of 400lb., equal to 177lb. on the square inch." Such a limit appears to be absurdly low, now that we are accustomed to cements which well bear a tension of from 400 to 450lb. on the square inch, and yet some eminent cement manufacturers of that time gave it as their opinion that a strain of 133lb. on the square inch was as much as cement could be expected to stand. Although the seven day test with neat cement is still very generally adopted on account of the inconvenience which a further delay in ascertaining the quality of supplies would entail, it is admitted that with hard-burnt, slow-setting, cements a period of twenty-eight days would allow of much more satisfactory results being obtained. Tests should also be made with a mixture of one part of cement and three parts of clean sharp sand; briquettes made of this mixture should be put in water twenty-four hours after they have been made, and at the expiration of twenty-eight days bear a strain of 250lb. on the square inch. It is important that the same description of sand should be employed in all cases, the particular kind of sand now very generally adopted is that obtained from Wortley Field sand-pits, near Leighton Buzzard. The grains of sand should also be of uniform size, and only those portions should be employed which have passed through a sieve of 900, and been retained by one of 1,600 meshes to the square inch. Inasmuch as the finer grinding of any cement makes its weight per bushel lighter, the actual specific gravity of the cement (which should be 3·1) is now regarded as a better criterion of its quality. A new method of calcining cement has been proposed by Mr. Frederick Ransome, which yields very promising results. It consists in the use of a furnace composed of a revolving cylinder placed in an inclined position, and lined with firebricks or other refractory material in such a manner as to produce a number of parallel longitudinal ridges, or "feathers" through the entire length of the cylinder. The fuel employed is gas obtained from slack coal by means of an ordinary gas producer, the air necessary for its combustion passing through a regenerator heated by the waste heat from the revolving furnace. The slurry is lifted to a hopper placed at the upper end of the cylinder, from which it falls in a steady shower through the flame of the burning gases, which enter at the lower end of the cylinder. The slurry, as the cylinder revolves, is caught by the "feathers," and is lifted until the feather attains such an inclination as to shoot it off to the bottom again, but owing to the inclined position of the cylinder at every revolution, gradually nearer to the lower end; this occurs repeatedly, until the completely calcined cement falls into a receptacle at the lower end of the cylinder, which is rotated at such a speed as to allow about half-an-hour for the cement material to pass from one end of the cylinder to the other. It is obvious that such a method must possess several important advantages:— (1) The cement when it leaves the cylinder is in the condition of a coarse powder, some of the particles being about the size of beans, instead of being in heavy lumps of hard clinker; it is, consequently, capable of being easily ground to a fine powder, which is not the case with the ordinary cement clinker. (2) A very considerable saving of fuel is effected, the consumption being estimated at not more than one-third of that required in ordinary kilns. (3) The temperature is completely under control, and the cement is not exposed to a high temperature for a longer period than is necessary for perfect calcination, whilst every particle is subjected to the same amount of heat; the cement is,

consequently, of a more uniform character. (4) The plant required is of a less expensive character than is necessary with ordinary or circular kilns, a cylinder of about 4ft. in diameter, and 20ft. in length, being regarded as capable of turning out as much cement as a 30-ton ordinary kiln. The most important point to be determined in the analysis of Portland cement is the proportion of lime, which in a well-made cement should be from 58 to 62, or perhaps 63 per cent. Any excess of lime should always be regarded with suspicion, inasmuch as it is well known that by increasing the proportion of lime, the strength of briquettes made of such cement at the end of seven days may be augmented. An excessive amount of lime, however, cannot be employed without incurring the risk of the cement cracking and becoming disintegrated. When the lime is associated with magnesia, the magnesia should be regarded as to some extent taking the place of the lime, and the quantity of the lime should be proportionally diminished. A well-prepared Portland cement, such as is made on the Thames or the Medway, should not contain any appreciable quantity of magnesia, say, about one per cent. Although any large proportion of magnesia in Portland cement cannot be considered desirable, yet it must not be forgotten that magnesia is capable of forming hydrates of great permanence and hardness, and that some very good hydraulic cements contain as much as 8 per cent. of magnesia, such, for example, as the well-known Rosendale cement of the United States of America. There can be little doubt but that the assertions that have been frequently made as regards the tendency of cements containing magnesia to disintegrate may sometimes have arisen from overlooking the fact that the results observed might be due to excess of basic constituents in the cement. In a recent statement put forward as to the injurious action of magnesia, the cement referred to contained 72 per cent. of lime and magnesia, and it could scarcely be regarded as extraordinary that such a cement should prove a complete failure, since it is well known that such a proportion as 72 per cent. of lime would render any Portland cement so unsafe as to cause it to be condemned.* One of the materials of which it has been attempted to make cement similar in its character to Portland is blast-furnace slag. Many endeavours have been made from time to time to utilise a material for which, until a few years ago, no application could be found except for road-making purposes. A great number of patents have been taken out with the view of accomplishing this object. In 1864 the plan of subjecting the melted slag (as it runs from the furnace) to a powerful jet of air or steam was proposed by Mr. Geo. Parry, which causes the slag to assume the appearance of wool. This slag wool can be used for a variety of purposes, and, being a bad conductor of heat, is well adapted for use as a covering for boilers' steam-pipes. When we recollect that this slag consists principally of silica, alumina, and lime, and that the silica is in a condition in which it is more readily capable of entering into new combinations than it is when in the form of clay, it might be expected that we have in blast-furnace slag a material peculiarly calculated to be of service in the manufacture of cement, artificial stone, or mortar. Accordingly, we find that, as far back as 37 years ago, attempts were made to utilise slag for such purposes. In 1850 a patent was secured by Mr. Jos. Gibbs for the manufacture of mortar and artificial stone by mixing ground slag with lime. The subject was subsequently taken up by some of the owners of ironworks, and a method for working slag was devised by Mr. Chas. Wood, of Middlesbrough, by the adoption of which he estimated that slag could be reduced to the condition of slag sand at a cost of a few pence per ton. The molten slag is made to flow into a bath of water, which is kept in a state of violent agitation by a revolving cylinder provided with a series of perforated screens or buckets, by which the slag is separated into small particles and carried up into a spout, which conveys it into trucks placed to receive it, the water falling back into the bath through the perforated screens. Many thousands of tons of slag sand have been manufactured in this manner, from which mortar is prepared by grinding the slag with 5 per cent. of lime, the mortar setting so quickly that it is necessary to use it within twenty-four hours of its having been made. Bricks are also manufactured in vast quantities by mixing the slag sand with 10 per cent. of slaked lime, and pressing the mixture into bricks, which, when dry, are ready for use, without requiring to be subjected to the heat of a kiln. Attempts have long been made to manufacture a cement resembling Portland from slag sand, but until recently without leading to any very successful result. If care be taken in selecting the slag sand, in ascertaining its composition, and in mixing with the proper proportion of chalk, very excellent cement may be produced, for the calcining of which Ransome's revolving cylinder is especially adapted. The slag-sand cement, prepared in a proper manner by what is called the homogenised cement process, as promoted by the Improved Cement Company, certainly gives results which are somewhat surprising, since briquettes made of this cement, whether tested neat at the end of seven days, or mixed with three parts of sand at the end of twenty-eight days, will stand the same tension test as good Portland cement. At the same time it must be borne in mind that great caution is necessary in adopting a cement of this nature, more especially when it is recollected that blast-furnace slags differ materially in their composition, and it is therefore not surprising that the introduction of a cement of this unusual character should have much to contend with as regards want of confidence in its power to retain its good properties for any length of time, more especially as previous experience on the subject of cement would tend to lead to the conclusion that no sufficient combination of the silica and alumina with the lime could be brought about by mechanical mixture alone, however intimately the substances might be incorporated with each other. It would appear, however, that when care is taken to see that the constituents of the cement exist in suitable proportions, a very serviceable article is capable of being produced. The cement is prepared by simply mixing together, in the most intimate manner possible, slag sand and dry well-slaked lime, without subjecting the mixture to any firing process. The secret of the success that has attended this method of making cement would seem to be the result of the very intimate mixture that is obtained by means of a revolving metal cylinder containing a number of iron balls, favoured by the soft and somewhat spongy character of the slag sand. In this, as well as in all new descriptions of cement, time is necessary to discover its defects or establish its merits. If a cement made in so simple a manner will continue to increase in strength for as long a time and to the same extent as Portland, this slag sand cement must become an important branch of manufacture; but at present its lasting qualities are not sufficiently established to allow of its being employed for any important work without the engineer incurring a little responsibility. It has, however, been clearly proved that a very excellent material, capable of being used as cement mortar, can be made out of slag sand by this method. Some excitement has lately been created by numerous letters which have appeared in the newspapers on the results produced by mixing sugar and lime together for the manufacture of mortars and cements. Unfortunately, these communications have seldom given sufficient details of the nature of the experiments made to enable anyone to say how far the results described are due to the sugar or to other causes. A mixture of sugar and pure lime made into a paste will set very hard upon the surface, but the interior of the mass remains in a friable condition, and will not withstand the action of water. Sugar may possibly be used with advantage where only pure lime is to be obtained, but it is not probable that any such mixture will compete in strength and durability with a good hydraulic lime. Amongst the most recent novel applications of cement are those of Mr. Wilson, of Grays, Essex, who, by inclosing in the cement wire-netting and hoop-iron, so strengthens it as to enable him to construct cisterns and drain-pipes that will stand very rough treatment, without being inconveniently heavy. He also constructs telegraph poles, as well as a variety of other articles for which cement has hitherto been considered as unsuitable.

* From a recent report of Professor Brazier on the cause of the failure of some Portland cement used in the construction of a graving dock in Aberdeen Harbour, it would appear that the reaction which takes place between the magnesium chloride contained in sea-water and lime may, under certain conditions, be sufficient to cause the disintegration of some descriptions of Portland cement, the lime in the cement being dissolved.

PLASTER OF PARIS.



The setting of cements like Portland and Roman is due to combinations of a somewhat complicated character, the precise nature of which is far from being distinctly understood. It is altogether a different question with respect to plaster of Paris, which is due to hydration only. Gypsum is sulphate of lime combined with water, and when exposed to a temperature of about 360deg. Fahr. the water is driven off, and anhydrous sulphate of lime, known as plaster of Paris, remains. Sulphate of lime is found in nature in the form of transparent prisms, as selenite, and in opaque and semi-opaque masses, as alabaster and gypsum; it is also found not in combination with water, in which condition it is termed anhydrite. The principal beds of gypsum belong to the Tertiary system, the finest of these deposits being those of the Paris basin in the district of Montmartre. In this country it is found most abundantly in the counties of Derbyshire and Nottingham, extensive plaster works being carried on in the Vale of Belvoir, a short distance from Newark, where the gypsum occurs in beds varying in thickness from a few inches to 3 or 4ft. The only preparation which the gypsum undergoes previous to calcining consists in chipping off the outer portions, which, being contaminated with earthy matter, would injure the colour of the plaster. With all the varieties of gypsum there is a tendency to assume a crystalline character, and accordingly, as it possesses less or more of this structure, it is described as dense, granular, or fibrous. The white translucent alabaster which is used in statuary is a compact mass of crystalline grains, so soft as to be capable of being easily turned or cut. The altar piece in the chapel at Chatsworth is a fine example of alabaster work. Gypsum, when finely ground, is known in the colour trade as terra alba, and is used to a considerable extent in the manufacture of colours. It is, however, in the form of plaster of Paris that sulphate of lime is of the greatest value in commerce and in the arts. For its production several methods of heating the gypsum are adopted, a flat kiln or oven being generally employed in this country. After raising the kiln to a temperature of a low red heat, the firing is discontinued, and it is charged with the lumps of gypsum, which, after about eighteen hours, has lost its water of hydration, and become converted into plaster of Paris. The kiln is sometimes worked continuously, and is heated by flues which are carried round the chamber in which the gypsum is placed; when this method is adopted, it is necessary that care should be taken that the temperature does not rise too high, and that the plaster is withdrawn as soon as the water has been expelled. Considerable experience is required in carrying out this process (which is simply one of dehydration) successfully, for although when the temperature is kept within proper limits the plaster possesses the power of re-absorbing its water with avidity, yet this power is diminished if the gypsum be overheated. When subjected to a red heat for some time, the gypsum increases in density, and if this temperature be continued it gradually assumes the character of natural anhydrite, which does not possess the properties of plaster of Paris. It is safer not to drive off the whole of the water rather than risk exposing the gypsum to too high a temperature, as the retention of a small portion of its water does not prevent the plaster from re-absorbing the water that has been driven off. Although plaster of Paris does not chemically combine with more than one-fourth of its weight of water, yet it is capable of forming a much larger quantity into a solid mass, the particles of gypsum being converted into a network of crystals inclosing mechanically the remainder of the water. The value of plaster depends upon this property of setting with a very large quantity of water, for if the plaster were not capable of being used in the condition of a thin paste, its value as a material for taking casts would be greatly diminished; the thin plaster, when poured into a mould, fills every cavity, and the slight expansion which takes place in the act of setting forces it into the finest lines of the moulds. Sulphate of lime is soluble in

water to the extent of one part in 400, the solubility being but little influenced by temperature. It is on account of this solubility in water that cements which consist in a great measure of plaster of Paris are incapable of bearing exposure to the weather. By mixing gypsum with a small quantity of certain salts, such as alum, borax, and sulphate of potash, it is rendered capable of bearing a higher temperature than ordinary gypsum, without injury, and the character of the plaster produced is altered, the mixture setting into a harder material or cement, of which we have examples in the cements known as Keen's Parian and Robinson's.

PICCADILLY CIRCUS.

THE week before last we fully described the various schemes which the Metropolitan Board of Works have under consideration for the completion of Piccadilly-circus; there is, therefore, no occasion now to enumerate the different proposals; but we have made a sketch from the large model of the most important design hitherto brought forward. The idea of this plan is to provide a series of shops on the polygonal piece of land which forms one

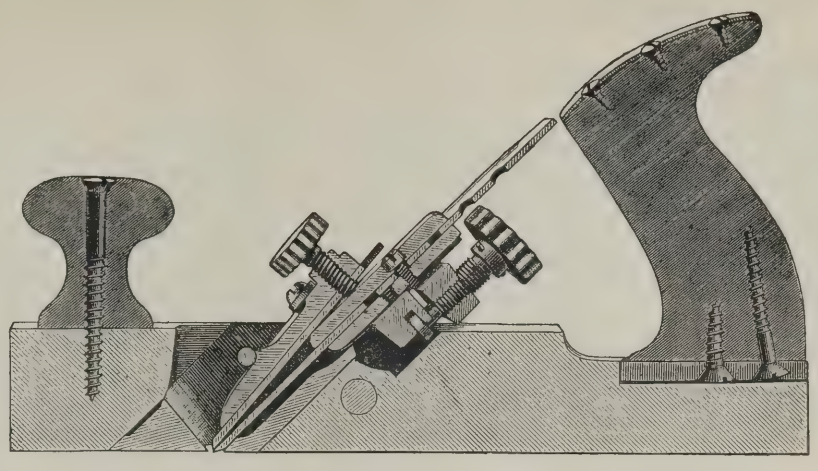
quarter of the circus, and occupies the central area of the present open site. We have endeavoured to give a correct rendering of this design, and also accompany the view with a sketch plan so that our readers may fairly judge of the merits and disadvantages of the scheme. Any proposal which covers the available ground with buildings, excepting perhaps a fountain with statuary, the whole forming a refuge as well, should be unreservedly rejected; and, in our opinion, it would be very difficult to conceive a more objectionable plan in every way than that which we illustrate herewith. We can hardly think that the majority of the Metropolitan Board of Works will agree to the erection of such a monstrous structure, whatever may be urged by some members as to the high rentals which the proposed shops would secure. We presume that Mr. T. Blashill, the architect to the Board, has, in preparing this design, only carried out his instructions, and endeavoured to realise as best he might the ideas of certain members who are working in the matter. The secretary to the Shaftesbury Memorial Committee sends the following letter, which certainly seems more to the point, always provided, of course, that the fountain he proposes is suitable to the site. A combination of a refuge and underground public convenience, coupled with a fountain and place for pot shrubs and flowers round its base, seems to afford the only satisfactory solution of the problem now attracting such widespread attention.

SIR,—May I be allowed to suggest that the bronze memorial of the late Lord Shaftesbury would be an additional attraction if one of the triangular spaces could be secured for its site? Mr. Alfred Gilbert, A.R.A., has been commissioned to execute this work, and has for some time been busily engaged with the model. It will partake of the character of a fountain, and will be useful as well as ornamental—in fact a work of art which would do credit to the site, for which it is admirably adapted, and be a fitting memorial of the great man whose works of mercy it will symbolise and whose memory it is intended to honour and perpetuate. I venture to submit, Sir, that nothing would be more appropriate at the commencement of Shaftesbury-avenue than an artistically-executed memorial of the late Lord Shaftesbury; it would, moreover, I believe, have the generous approval of the entire public. —I am, Sir, your obedient servant,

H. R. WILLIAMS, Hon. Sec. Shaftesbury Memorial Committee.

6, Lime-street, E.C.

The main thing to be considered is public convenience, combined with the improved appearance of our great thoroughfare, and in crowded London these desiderata for the most part are not realised for lack of uninterrupted open spaces. This area has been secured at a vast outlay. Why spend more money in blocking it up again?



BOSAHAN HOUSE, CORNWALL.

BOSAHAN HOUSE, at St. Anthony's, six miles from Falmouth, which has been in course of reconstruction during the past three years for Mr. A. Pendares Vivian, from plans by Mr. Ewan Christian, of Whitehall, is now approaching completion. The style of the new mansion is Elizabethan, and the house alone, excluding the splendid stables and other outbuildings, covers a ground area of 21,760ft. It is built of stone quarried on the estate, the mullions and dressed parts being Doulting stone from Somersetshire, worked and fixed by Messrs. C. Trask and Sons. The main entrance to the mansion is by two vestibules, 10ft. square. The first one has heavy old oak doors. One of the vestibules is paved with Devonshire marble, and the other with serpentine, diamond pattern. Through the vestibules the great hall, 50ft. long and 22ft. wide, is reached. The floor is laid with old oak from Adair House, St. James's-square, now the Junior Carlton Club. Immediately facing the entrance is a large 26-light window, containing numerous crests, arms, &c., in stained glass, executed by Messrs. Heaton, Butler, and Bayne, of London. On the right of the great hall are a fireplace and walnut mantelpiece. The last is 14ft. in length and 9ft. 9in. in height, and was carved at Verona expressly for the hall. The panelling round the hall is oak from an old house in London; two wrought-iron columns near the entrance came from an old church in London. The walls will be hung with Flemish tapestry, and on the panelling will be an authentic collection of old arms. The hall will also be adorned with heads of the wapiti, buffalo, moose, elk, bear, red deer (Scotch), antelope, &c., all of Mr. Vivian's own killing. The roof of the great hall is supported by a number of corbels carved by Mr. Harry Hems, of Exeter. The corbels are 22ft. from the floor, and from floor to apex the height of the roof is 45ft. In the roof above there are 2,550 cubic feet of oak weighing more than 30 tons. The hall will be lighted by eight 32-candle-power electric lights, hanging from the hammer beams. From the great hall is a staircase 6ft. wide, with oak dado and carved newels. On the left of the hall is a spacious billiard-room, 30ft. by 20ft., and having bay windows 12ft. by 6ft. The mantelpiece, like the one in the large hall, is of Italian walnut, with Verona carving. The ceiling is a copy of a well-known one at Knowle, Kent. The room will be lit by six 16-power electric lights. Both the great hall and the billiard-room will be heated with hot-water pipes fitted by Mr. Tirrell, of Redruth. The next room on the left is the library, 18ft. by 20ft., with bay window. The mantel is in a Louis Seize style, composed of Sienna marble beautifully carved. The library opens into the drawing-room by large folding doors. The drawing-room is 30ft. by 18ft., with a bay 12ft. by 5ft. The mantelpiece is Louis Seize in style, and is of pure white statuary marble, from Brussels. The floor is of oak, covered with an Indian carpet. The door and window fittings are of teak, while the mock shutters are from Lord Stair's old house, as is also the hearth. The ceiling is a copy of one at Crewe Hall, the seat of Lord Crewe, the work being done by Messrs. Jackson, of London. On the right of the great hall is the dining-room, also 30ft. by 18ft, with a bay 10ft. by 6ft. The floor is of oak. The fireplace is from the house of Lord Stair, the beautiful carved wood, painted white, being lined with Poltesco serpentine. The side tables are Italian with marble slabs. The fender is also Italian, and the ornaments are old French bronzes. A fine piece of furniture in this room is an Old English Sheraton sideboard. The dining-table is of Spanish mahogany. The floor is covered with a modern Turkey carpet. The electric bells are fitted in Florentine bronzes, excepting one at the head of the table, which is movable on the floor, and rung by pressing with the foot. There are four electric lights on brackets and one pendant. Passing out of the dining-room and through a lobby, Mr. Vivian's private room is reached. Its dimensions are 18ft. by 16ft., with an octagon bay, copied from Guy's Cliff, Warwickshire. From this room the gun or work-room is reached, this being 20ft. by 18ft., and from it a corridor leads to the garden entrance and the offices. The kitchen is 32ft. by 18ft., while the butler's pantry is 24ft. by 15ft. On the other side of the passage are the servants' hall, 23ft. by 14ft., and the scullery, 15ft. by 14ft. The housekeeper's room adjoining the gun room is 18ft. by 15ft. The store room, butler's room, dairy, &c., are also on the ground floor. On the chamber floor there are four spare bedrooms and dressing-rooms, boudoir, and servants' bedrooms, &c. On the

ttic floor there are eleven bedrooms. There re bathrooms on each floor. The bays of all he principal rooms are laid with parquetry of ak, the work of the carpenters on the spot. 'wenty-one of the doors are from an old manor- ouse in Nottinghamshire. The whole man- ion is lighted with electricity, the fittings eing by Messrs. Crompton, of Mansion-house uildings, London. The power for working hese is supplied by an engine of eight nominal orse-power, erected by Messrs. Marshall, of ainsborough. In addition to working the ynamo, the engine is used for pumping water o the tanks at the top of the mansion. A lift orks from the bottom to the top of the build- ng. In the tower there are cisterns capable f storing 6,000 gallons of water. Here also a large clock with two faces, north and east, ade of Cornish copper, and manufactured at he Vivian Works in Wales. The clock is sup- lied by Messrs. Gillett and Co., of Croydon, nd has chimes. The top flats of the building re of copper, as also are all the down pipes, ain troughs, &c. The roofs, 44 in number, re slated with green Welsh slate from Cardi- anshire. On the top flat is a curious bell, hich was in the old house, which till recently ccupied part of the same house. It is dated 505, bears the words "Anno Domini, Maria ocor.," and is supposed to have originally elonged to a convent. The height of the uilding from ground to copper flats is 60ft. bove the turret is a Tudor dome, covered with opper. The mansion has been erected through- ut with hydraulic lime, mixed with clinkers nstead of sand, thus rendering it exceedingly ard. There is a vertical asphalte damp-course rom top to bottom between the stonework, all he outer walls being of two thicknesses, the amp-course being between them. All the ex- erior walls are 2ft. 3in. thick, and none of the nterior walls are less than 9in. in thickness. he stables are about 100ft. from the house. hey consist of six stalls and two loose-boxes, ompletely fitted with Musgrave's patent fit- ngs; they are paved with Cornish brick, and re lighted by electricity. Above are a large oft and sleeping rooms. The coach-house and addle-room adjoin the stables. In the former here is room for six carriages. At the end of he stable buildings is the laundry. Within a hort distance are the engine shed and boiler ouse. Everything has been carried out in a ubstantial manner, both in regard to the uildings themselves and also in connection ith the interior fittings, the question of cost eing of secondary importance. The two ter- aces in front of the house have been com- leted. They are over 300ft. long. The grounds re being laid out by Mr. W. Crawford. The lerk of works is Mr. F. W. Mansell, of London, nd Mr. W. Rowe is foreman of joiners. The ot-water work to baths and sinks, and copper ork to roofs and flats laid by Mr. Wilton, of edruth. The painting and glazing are by Mr. . Glasson, of Truro; and the blinds and pholsterer's work by Messrs. Criddle and mith, of Truro.

BOOKS RECEIVED.

Illustrations of Old Ipswich, by John Glyde Ipswich: John Glyde, 35, St. Matthew's- treet). The present part—No. V.—deals with The Bridges of Ipswich," which, though ostly of modern construction, are upon the ines of the ancient structures, which were ecessarily narrow. The architecture of old ridges is one of the most scanty records, and, herefore, we think Mr. John Glyde has done ell to illustrate and describe those both past nd present spanning the three streams on hich Ipswich is built. The photogravure of ld Stoke Bridge, which crossed the Orwell, and onnected Ipswich with the hamlet of Stoke, lustrates one of the masonry bridges of he ancient type, built of brick and stone. It of three arches of elliptical shape, the piers aving cutwaters, niches, and panels above, nished by cornice and balustrade, which artake, as usual in all ancient bridges, a considerable rise. This old stone ridge was erected in 1670, and was destroyed y a flood in 1818; the photogravure being aken from a water-colour drawing of the ridge as it stood in 1790. Many particulars aken from the old records relating to repairs f Stoke Bridge are of interest, especially the accounts of the surveyors, John Sawyer and Jonathan Button, referring to the value of labour and materials. The present iron structure of one arch, 60ft. span, was designed and constructed by Mr. William Cubitt. Bourne Bridge is next described; though now rebuilt on the old foundations, it was, from the particulars given of it, a structure of seven pointed arches, which remained till nearly the end of the 18th century; the foundations of the old masonry carrying the present brick and timber structure are still visible in the bed and shores of the little Bourne stream at low tides. The present steep-pitched and narrow Handford Bridge stands upon the site of an ancient timber construction, of which many interesting facts are recorded. A brief notice is given of Friars Bridge, which formerly stood near the present Cattle Market, and apparently provided as a means of communication with the Franciscan Grey Friars priory. Mr. Glyde has the true zeal of the antiquary, and has from a variety of sources written a very readable account of the old Ipswich bridges.

NEW SELF-SETTING BENCH-PLANE.

THE sectional illustration represents a new self-acting bench-plane which has been perfected and is now manufactured and introduced by the Gage Tool Company, of Vineland, N. J. This tool combines the advantages of the iron and the wood plane, and is claimed to possess points of superiority over many excellent planes already on the market. The construction is clearly shown in the sectional view, and, as will be seen, is very simple. In replacing the bit no setting of the same is required, as it falls with great accuracy into the correct position, and in this respect the plane is self-setting. For minute accuracy the bit is adjusted by the screw shown behind the cutter, and after it has been properly adjusted it cannot be set wrong or be moved out of position by striking a knot while in the act of planing, which is a feature to be appreciated by all who have occasion to use a plane. The cap is not attached to the cutter, but remains stationary, and is clamped in position by the screw passing through it. The cutter can be moved up or down by the thumb-screw shown behind the bit, and thus, even while at work, the thickness of a shaving can be changed by a simple movement of the thumb and finger. Provisions have also been made by which the bit or cutter can be set square with the face of the plane, even if the cutter is not ground exactly square with itself. The throat is prevented from wear by being within the adjustable iron bit-holder, which extends through the plane. It is claimed, and this claim is based upon actual trial, that the cap and cutter can be removed and accurately readjusted in five seconds; consequently, the time saved in setting the bit would alone amount to many days' labour in the course of a year usually spent in setting the cutter. The Gage Tool Company pride themselves in their selection of the steel for and the tempering of the cutters, by which they obtain a uniform cutting quality, enabling the company to warrant their planes for planing the hardest hemlock knot to the satisfaction of the users. It is also claimed that the tool can be changed from a double to a single iron, or from a single to a double iron, in two seconds. It can be adjusted to the coarsest or finest work, and will smooth cross-grained, eaty, hard or soft wood, against the grain. The plane stocks are saturated with hot wax or oil. Old-fashioned wood-planes can readily be changed to this new plane.—*American Machinist.*

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

HAMPSHIRE FIELD CLUB.—On Tuesday week the members of this club visited, under the guidance of Mr. C. R. Pink, F.R.I.B.A., of Winchester, several churches in the upper part of the Itchen Valley—viz., Avington, a Georgian structure; Itchen Abbas, rebuilt in 1863, when the fine monuments were heaped together in a vault, where they still remain forgotten and uncared for; Easton, which has a fine vaulted Norman apse and Transition door; Mortimer's Worthy, with its fine Norman doorways, its roof and tombs; and Hydebourne, or Headbourne Worthy, with its picturesque and remarkable work of pre-Norman times, and with many interesting structural peculiarities, such as the Holy Rood, at the west end, in an upper chamber or chapel; its quaint tower, and flat buttresses. The rector, the Rev. J. H. Slessor, has preserved a *unique* Wykehamist monument—viz., a brass from the church floor, now fixed in the wall, commemorating a scholar of Winchester College, whose name is John Kent, a Berkshire lad, who was admitted a scholar in 1431, and died in 1434. As the solemn entry of the Warden and Fellows and scholars to Wykeham's New Buildings here was made in 1393, this monument recalls a "boy" who was admitted 38 years after the "entry," and it is, we imagine, the earliest extant memorial of a scholar. The effigy, from its style, is doubtless a likeness, and wears the robe pretty much as scholars do now, save that it is longer. The effigy has a label issuing from the mouth, with the words—"Misericordias Domini in eternum Cantabo"; whilst at the feet of the figure is "Hic Jacet Johes Kent, quondum Scholaris novi Collegii de Wynchestre, et fileus Simonis Kent de Redynge cusjus anime propitietur Deus." Under the eastern window, in the "God's Acre," rest the remains of the Rev. Joseph Bingham, author of the "Antiquities of the Christian Church," by which he is immortalised. He died rector of this parish in 1723.

The Wesleyan chapel at Guisborough, after having undergone extensive alterations and improvements, was reopened on Sunday. The chapel has practically been rebuilt, only part of the walls of the old chapel, erected in 1811, not having been removed. The total cost of the alterations will reach about £1,500. The rebuilt chapel is Gothic in character, and the chief elevation is of red pressed bricks with stone dressings. 100 extra sittings have been provided. The contractors were Mr. A. White, Guisborough, for the brick and stone work and slating; Mr. Wm. Heckle, Guisborough, the wood work; Mr. Jas. Purdy, Guisborough, the plumbing; and Mr. W. T. Harrison, Guisborough, the painting.

A band of forgers of antiquities purporting to come from prehistoric lake dwellings in Switzerland have been unmasked. Some of them are being prosecuted before the cantonal tribunal at Freiburg, and have made admissions which fully bear out suspicions long lurking in the minds of Swiss archæologists. Stäffis seems to have been the headquarters of the spurious trade.

The War Department intend to construct a new railway connecting the whole line of forts along the Medway valley, now in course of formation for the protection of the garrison and the dockyard against attack on the land side.

OUR LITHOGRAPHIC ILLUSTRATIONS.

"THE REPOSE IN EGYPT."

THE evident favour with which our previous reproductions of Carl Müller's pictures have been received induces us to give another. "The Repose in Egypt" tells its own story too well to need description, and the scene represented may be elaborated at will by any student of Scriptural art.

INTERIOR VIEWS OF NOTRE DAME, CHALONS-SUR-MARNE, FRANCE.

THESE spirited pencil and tint drawings are by Mr. Arnold B. Mitchell, A.R.I.B.A., and form part of the series which he prepared when Soane Medallist of the Institute, and for the same series of studies a medal in the Pugin Traveling Studentship competition was this year awarded him. The church of Notre Dame, Châlons-sur-Marne, is one of the most exquisite examples of Early French Gothic extant, furnishing at once a model in general design and arrangement peculiarly typical of the Transitional period. In some respects the detail is very like the choir at Canterbury and Sens. It was rebuilt by Bishop Boso ("Gallia Christiana," Tom. II. p. 506), and dates from 1157 to 1183, during which latter year the church was consecrated by Bishop Guido. M. Viollet-le-Duc, in his "Dictionnaire de l'Architecture," under the article on Construction, Vol. IV., p. 75, gives the several plans of the apse at various heights, including the chapels which form the chevet, together with a view of the ambulatory showing the entrance to one of these radiating chapels; and he likewise gives a cross section through the apse illustrating the flying buttresses, triforium, and groining. Further drawings follow in the same volume of the richly-treated corbel table round the apse, illustrating the chapter devoted to the "Corniche," p. 331, and under "Corbeau," p. 317, a sketch is printed showing how the diagonal ribs terminate against the wall shaft caps in the aisles. In Vol. V., among the articles illustrating his valuable treatise on "Fenêtres," M. Viollet-le-Duc publishes exterior and interior elevations of the upper range of apse windows, giving a detailed plan showing how the utmost light has been obtained at the clerestory level with a minimum use of masonry. Mr. Eden Nesfield, in his "Specimens of Mediæval Architecture" (plates 19 and 20), published two views—the one a general interior, similar to Mr. Mitchell's sketch herewith given, and a view looking into the easternmost chapels. Mr. George Edmund Street's autograph study of this chevet appeared in our own pages a short time since (see BUILDING NEWS, Feb. 6, 1885), and may be advantageously referred to in this connection. Mr. Mitchell's sketch from the north transept looking west into the nave gives an admirable idea of the interior elevation and leading features in the noble design of this church. The triforium gallery is rather wider than the aisle below it, and is both vast and lofty as well as beautifully proportioned. The height of the nave from the pavement to the top soffit of the vaulting arches is 68ft. 3in., and the width between the wall piers, which are about 18in. in diameter, is 28ft. 4in., the aisles being 12ft. 9in. wide from pier to pier. To the springing of the roof vaults of the nave the height measures 49ft. The triforium floor is 28ft. 5in. from the ground pavement level, and to the clerestory string it is 47ft. The bays of the nave arcade between the responds figure 12ft. 2½in., the caps of these piers being 16ft. 10in. from the floor to the upper line of the abacus, while the capitals, abacus included, are 2ft. 1½in. high. The western façade is, comparatively speaking, more simply treated, but the great towers and lead-capped spires are particularly bold and handsome. The towers measure 104ft. 9in. to the top of the cornice from the ground, and the spires to the base of the finials are 97ft. 6in., giving a total height of 202ft. 3in. As specimens of carpentry the spires are very notable instances. Mr. R. J. Johnson, in his rare book "Specimens of Early French Architecture," gives some views and carefully-measured drawings, with mouldings and profiles to a larger scale (plates 51 to 56). A ground plan of the church itself does not seem to have been published.

CRANSHAW HALL—THE LARGE SALON.

THE problem in the decoration forming the subject of the accompanying illustration was to obtain in an ordinary and not very interesting, large country mansion one large and lofty room, by including several small rooms, running through two stories in height. The existing corridors and staircases have been utilised, and access obtained from them to the musicians' gallery, shown over the entrance doors. The ceiling and spandrels are carried out in thin canvas plaster, and the woodwork is in painted deal, with the exception of doors and window finishings, which are in dark Spanish mahogany, with satinwood and lighter mahogany in the panels. The mantel, of which only a small portion shows in the drawing, is carried out in alabaster and a marble obtained from the locality. The work has been executed from the designs of Mr. Walter Hensman, of Shepherd's-bush, Mr. F. Myford acting as clerk of works.

SOMERVILLE HALL, OXFORD.

THIS is one of the Halls for lady students. The existing premises having proved inadequate to keep pace with the growth of the movement, the council decided to erect an entirely new block of buildings to supplement them. The idea of this scheme is that the students should live as members of a large family under the care of a lady principal, each being provided with a separate apartment, fitted up as a combined sitting-room and bedroom. Hence the arrangement of the plan corresponds somewhat to that of an ordinary residence. Tuition and lecturing are provided for elsewhere. Diagram plans accompany the view, which will explain themselves, a point being that the majority of the students' rooms reap some benefit from sunshine. Economy has had to be carefully considered, and only a portion of the block has at present been built. The work has been carried out by Messrs. Symon and Co., contractors, Oxford. Mr. H. Wilkinson Moore is the architect.

BUSINESS PREMISES, NOS. 86 AND 87, STRAND, W.C.

THESE premises occupy the site of Nos. 86 and 87, Strand, No. 86 being formerly well known as Osmond's Hotel. They have now been incorporated in one building, the property of Mr. W. Campbell, jeweller, who retains for his own use the ground floor and half the basement. The upper portion of building is intended to be used as a private hotel or for offices; the entrance to this portion is on the west side. The building up to level of first floor has been built in cement, with fireproof floors, with strong double fireproof doors shutting off Mr. Campbell's shop and the staircase to the upper portion. The shop is fitted up in specially-designed American walnut fittings, and with panelled ceiling of enamelled iron. The upper portion of building contains large coffee and smoking rooms, lavatory, bath, and w.c. accommodation, and about seventeen other rooms, exclusive of kitchen, &c., on top floor. The front is executed in cut red brick with Portland stone dressings and red Mansfield panels, the pilasters to the shop being of granite, with specially cast bronze capitals and bases. The general works have been carried out very satisfactorily by Mr. S. Jerrard, of Lewisham, S.E., who, as also his foreman on the works, Mr. Vouseley, have paid special attention to their work, and great credit is due to both. The lift is by Messrs. Waygood and Co; the shop fittings were executed by Messrs. Colls and Sons, and the shutters by Messrs. Francis and Co. The carving both to stone and brick, and the modelling of capitals, was the work of Mr. G. Frampton, jun., of Camberwell. The whole of the works have been carried out from the designs and under the superintendence of Mr. Alfred Drewe, architect, of 28 and 29, St. Swithin's-lane, E.C., and Margate.

MODERN LAMPS.

WE illustrate four lamps, all copies of old work. Three are reproduced from the designs of Thomas Chippendale, in brass; and the fourth is in wrought iron. They were made for an exhibition a short time since by Mr. Litchfield.

SHOPS AT STREATHAM.

OUR illustration represents a block of large freehold shops recently erected on the High-road, adjoining Streatham Railway Station, and is evidence of the marvellously rapid growth of suburban London during the last few years.

A short time since Streatham was a picturesque village. It is now a busy town, well supplied with shops and business premises equal to those of the West-end. The above block consists of seven large shops covering the triangular piece of land formed by the junction of the High-road and Gleneagle-road. They are specially adapted for businesses requiring large show room and storage accommodation. The ground and basement floors are each 50ft. deep with entrances from both roads. There are eight living rooms over each shop. The elevation is Flemish in character, of red brick and Bath stone dressings. They were designed and erected under the superintendence of Messrs. Wheeler and Hollands, F.R.I.B.A., of Chancery-lane, W.C., the lower part of the circular corner building being specially designed for the Alliance Bank (Limited) by Mr. Pinches, A.R.I.B.A., of the Adelphi, who also designed the elaborate fittings and strong rooms of the bank. The whole of the premises have been built and fitted up by Messrs. Hill, Bros., builders and contractors, Broadway, Streatham, S.W.

The new recreation-ground at Kilburn, purchased of the Ecclesiastical Commissioners by the City Corporation, is being laid out, and will be formally opened by the Lord Mayor in about a month's time. It consists of about 30 acres of grass land lying between Kensal-green and Queen's Park stations, and is being planted with some 5,000 young trees, brought from the Corporation Nursery at Epping, and with many shrubs, while tar-paths cross the ground in various directions. The work is being carried out at a cost of £3,000 under the supervision of Major Mackenzie.

Considerable improvements have been lately made to the church of St. Edmund, King and Martyr, in Lombard-street. The old stone step which disfigured the chancel have been removed and replaced with steps of white marble, and the floor has been relaid with black and white marble tiles. The work has been carried out by Messrs. Arthur Lee and Bros., of Bristol.

New premises are on the point of completion at the corner of the Haymarket and Coventry-street, being the first block erected in the Piccadilly improvement scheme. The building is French Renaissance in character, and was designed by Mr. H. H. Collins, of Old Broad-street, E.C. The cost of the building has been about £21,000. The contractor was Mr. Wm. Brass, of Old-street; the ironwork and fireproof construction were supplied by Messrs. Dennett and Ingle, the stained glass by Mr. Wm. Gibbs, of Kingsland-road; and the carving was executed by Mr. Sanson.

Mr. Henry Irving is to unveil next month the fountain and clock tower presented to Stratford-on-Avon by Mr. Childs, of Philadelphia, as a Jubilee tribute, and now being constructed from designs by Mr. J. A. Cossins, of Birmingham.

WAYSIDE NOTES.

AT a recent meeting of the British Association, Professor Osborne Reynolds delivered a very suggestive address touching the latest advances in mechanical science—suggestive, that is to say, of a possible similar paper on the progress made in architecture of late years. According to an opinion expressed by the late James Fergusson, in his "History of Architecture," there is no valid reason why our art should not be advanced towards perfection, in the same way as is that of steam-engine making or ship-building. Yet it is doubtful whether anyone would be bold enough to come forward and declare that architecture has steadily progressed since the best periods of the Middle Ages.

It is probable that the difference between Mr. Fergusson's idea and stern reality, is all the difference between theory and practice. Theoretically, architecture *could* be advanced. Practically, however, it would appear that it cannot be. The science of building advances, but the art of architecture varies ever in excellence. Neither can we ever hope for a different state of things till the millennium when all architects will subordinate the commission of 5 per cent. to the well-being of their art. At present we may have a marvellous degree of technical excellence in stone and wood-cutting; but in regard to the possibility of our carving forms of superior beauty to the productions of the old masters, as the sculptors at Conches said, it is impossible.

What's in a name? The Society of Architects hold a meeting on Tuesday next to discuss the advisability of prefixing to their *nom de guerre* the definite adjective with a big, big T. The Society certainly has the right to make the addition, taking into consideration its rapid growth and wholesome energy. But is it well to worry about trifles when so much work remains to be done? These are the sort of "reforms" we look for at the Institute, and not from St. James's Hall. I am glad to see the long list of thirty-one new members nominated for election next Tuesday.

The proposed visit of this society to York—albeit that it is to be held curiously late in the year, and dangerously so in respect of the chances of fair weather—is a highly commendable undertaking. The conferences, to be held at the same time, will be both entertaining and instructive. It is sincerely to be hoped that the discussion on "The Architects and Engineers Bill" will greatly help the cause of registration. Without a noble desire to pull together, the members of the architectural profession fail to take advantage of the most powerful and effective engine of modern economic science—viz., co-operation.

The visits contemplated in connection with the Society's stay at York include some most interesting old buildings. To those who have never been there, the city itself will be found a storehouse of old architecture. Then there are Ripon, Kirkstall Abbey, and Beverley Minster, besides other lions of the district, all of great interest; but the finest object included in the programme is undoubtedly Fountains Abbey.

No one can possibly become weary of seeing this beautiful ruin. Time has obliterated all the hard angles and every crude piece of human handiwork; rain and storm have softened every feature and moulding; lichens and many-coloured mosses glisten on the weatherings, and delicate plants thrive in the crevices of the grey stonework. Nature has long since adopted Fountains Abbey as her own child. She has washed and purified the creation of man, and now supports the aged stones with the strong arms of clinging ivy-stems, and lovingly protects them with shields of matted foliage.

Operations at St. Mary-le-Strand seem now fairly under way. Those persons who have never seen the interior of this church would be surprised at the elaboration of the internal architecture, which, excepting the arched ceiling of wood and plaster, is executed entirely in solid Portland stone. It is a pity that the place is decorated in a somewhat garish manner. As regards the danger of the condition of the exterior of the fabric, I have seen some pieces of stone from the cornices and coping that were simply pulled away by hand, and certainly seem to indicate the existence of considerable unsound work in the old masonry.

The church was the subject of a lengthy article in the *Times* of Saturday last, and on the same date, also, a letter from a well-known architect, stating that the vases were removed eight years back, and not fifteen years as I stated. Should any reader enter into a discussion about these "tea-urns," it will be well to keep distinct the eight vases that were at one time on different stages of the tower and those that were upon the main coping of the building. The former are the ones that were removed some fifteen years back by the worthy Mr. Bell, the parish beadle.

It has of late been rather fashionable for young students to decry the advantages of R.I.B.A. membership. No young architect, with his head screwed on the right way, will give credit to such remarks. Substantial benefit accrues even from the privilege of having A.R.I.B.A. after one's name, and I would remind intending candidates that on the 21st of November another exam. will be held by the Royal Institute. It is true there is Gwilt to be "carefully perused," but there are worse things at sea.

One very great benefit that the young practitioner would doubtless find by possessing the mystic initials is in his early competition work. The sealed letters accompanying the competitive designs for a new town hall in the provinces are opened, and Mr. Inexperienced, of London, is found to have won the prize. Now, if Mr. I. has A.R.I.B.A. after his name, the committee, perhaps with misgivings it is true, appoint him architect to the work. Had he not had the initials he would most likely have been compensated in some way, and a senior member of the profession have got the job.

How is that, although the City Fathers have now virtually no architect to advise them on building matters, the office of that official remains? On a board on a piece of vacant ground near the Guildhall there appears a notice, apparently quite recent, that application should be made to the office or department of the architect in the Guildhall. If there is no architect, and I understand that the Corporation decided to have none, it seems rather a paradox that there should be an architect's department.

Progress appears to be being made with the new Tower Bridge. Any belated traveller crossing London Bridge at night will notice a lurid glare in the black waters of the "Pool," where the works are being pushed forward. Another light on the river indicates the whereabouts of the new Thames subway. According to a report of a meeting of the Subway Company, the works are progressing rapidly.

What a miserably mean piece of business is the result of the sitting of the Committee on the Admiralty and War Office site. And who, after all, is to do the work in connection with the patching up of the old buildings? In all fairness one would think the preference should be given to Messrs. Leeming. But does the Office of Works require a job? Perhaps.

The complaints as to the tardy action of the Metropolitan Board of Works in passing theatre plans are doubtless well founded, and many architects must have been inconvenienced by the delay caused in getting their plans through the Board, either theatre or otherwise. But in the case of the former buildings, it is better for the public that there should be delay than that the plans should be "passed" in a hurry. One begins to get a little indignant with someone or something, be that person or thing a Government Inspector, an architect, a theatre lessee or manager, a standing set of by-laws, or defective stage appliances and machinery—one begins, I say, to be somewhat exasperated when, with the memory of appalling disasters in the past fresh and vividly before one, we hear of still greater wholesale human sacrifices near at hand, and the whole country is sickened by details of corpses burning till they are no more to be recognised than the charred remains of burnt timber. It is time that strong measures were taken to absolutely *prevent* any possibility of such scenes recurring; it is time that someone or another should be held responsible for the awful loss of life at such fires as that at Exeter; and it would be well that there should be someone to account for each human moth that perishes in the flames of these lamps that are fed from reservoirs in Hell and trimmed by emissaries of the Devil.

GOTH.

CHIPS.

An addition of some interest has been made to the attractions of the Old Manchester and Salford section at the Manchester Exhibition. Messrs. Darbishire and Smith, the architects of this section, have decorated and fitted up the reproduction of the chapel which formerly stood on Old Salford Bridge, so as to give a clear idea of the chantry chapel of the time of Edward III. The windows are of stained glass, lent by Messrs. Edmundson and Son, of Manchester; and the altar, its cross, the vessels, manuscripts, hangings, and priests' vestments are all actual examples of 14th-century work, lent for the purpose.

Mr. Francis Wiswale, C.E., now resident engineer at Goole for the Aire and Calder Company, and late engineer to the Bridgewater Navigation Company, has entered into an engagement with the Manchester Ship Canal Company, whereby he will resume his duties in connection with the Bridgewater Canal, which company has recently been acquired under the powers of the Ship Canal Act. The construction of the ship canal will involve important alterations to the Bridgewater Canal.

The task of conveying the Imperial sarcophagi to the Farnborough Hill Mausoleum has been safely accomplished by the constructors of the tombs, Messrs. Alexander Macdonald and Co., of London and Aberdeen, and the massive red granite structures are now in position on either side of the altar in the subterranean mortuary chamber. The Emperor's tomb (the Queen's gift to the Empress) was taken to Farnborough from Chislehurst partly by road and partly by rail, the coffin remaining in the church with the Prince Imperial's. The new sarcophagus was brought to London from Aberdeen by sea, and then transferred to the London and South-Western Railway, whose Farnborough Hill Station is within ten minutes' walk of the mausoleum. This, the Prince Imperial's sarcophagus, was made to the order of the Empress.

A new barrack is being built at Schleswig on the ruins of the old castle of Gottorp, erected in the 16th century, and in demolishing the old foundations the workmen laid bare a stone bearing a perfect Runic inscription. The stone stands nearly 4ft. high, and is 1ft. broad. It has an inscription in the usual characters on two faces, which reads as follows:—"Osfrida made this mound, the daughter of Vinthingar, to Sigtrig, the King, her son, on the holy place."

New board schools at Rawmarsh, Rotherham, were recently opened. They accommodate 300 children, and cost, exclusive of site, £2,300. Mr. J. Platts, of Rawmarsh, was the architect.

The local authority of Appleby have adopted a report by their engineer, Mr. Watson, for the improvement of the water supply of the district, subject to analyses of the proposed source. Mr. Watson proposes the tapping of the Tebay Beck at an elevation of 1,200ft. above the sea, the laying down of three miles of pipes, and the construction of a reservoir to contain water for the whole district at a cost of £1,000.

St. Anselm's Chapel, in Canterbury Cathedral, is about to be restored, Canon Holland, a member of the Chapter, having offered to defray the cost of the work. The chapel lies just beyond the south-east transept, and is one of the few portions of the building that escaped the great fire which, in 1174, destroyed the first Norman choir of Canterbury Cathedral. An altar is to be placed in the apse of the chapel, where one originally stood.

A large block of shops, with offices and chambers over, is about to be erected on the corner plot of ground of Oxford-street and Charing Cross-road (having a frontage of about 160ft.), by Messrs. Marler and Bennett, of Sloane-street, from designs prepared by Mr. T. Marcus Houghton, of Imperial Buildings, Ludgate-circus, E.C.

The parish church of Sutton Maddock, near Shifnal, Salop, is about to be rebuilt with the exception of the ancient tower and spire. It was reconstructed in the last century, and is about to be restored to something like its appearance in the middle ages—so far as can be ascertained from the older work built up into the walls. Mr. T. Nicholson, of Hereford, is the architect, and Mr. Inwood, of Malvern, the contractor; the estimated outlay is £1,900. Memorial stones were laid last week.

Building Intelligence.

ABERDEEN.—Several additions are at present being made to the public edifices in the principal thoroughfares of the Granite City, and by the erection of these buildings the somewhat monotonous outline which characterises Union-street will be relieved by the introduction of less massive architectural features. At the east end of the street, where on the north side, within a stones' throw of the Municipal Buildings, a pile four stories in height has just been commenced by the *Free Press* Publishing Company. The front wing of the new building forms a square, a back wing towards Nether Kirkgate being oblong. To Union-street the frontage will be 60ft., the depth 100ft., and the height from pavement to parapet 55ft. The plans, prepared by Messrs. Ellis and Wilson, architects, provide for enriched cornices and windows marked out by projecting pilasters and entablatures. A moulded cornice will surmount the third floor, with attic story above, over the centre of which rises a gablet. The chief entrance is in the centre of the front, and the doorway is flanked by columns, and has above a projecting balcony and balustrade. To the west of St. Nicholas-street a block is also shortly to be built by the Commercial Bank of Scotland, from designs by Mr. Sydney Mitchell, Edinburgh. On the opposite side, Messrs. Ellis and Wilson are the architects for a large block for Mr. R. W. Mackay, warehouseman, intended for a warehouse and shops. The entrance to the New Market, formerly about the middle of the premises, is now to be changed to the east end of the property, and widened. A considerable enlargement will also be made to the block at the back towards the Green. At the junction of Union-place with Holborn-street, a new church in the Gothic style, after plans by Messrs. Pirie and Clyne, is being erected for the St. James' Episcopal congregation; while almost opposite, and also fronting Holborn-street, a new church is in progress for the St. Nicholas-lane United Presbyterian congregation, the architects being Messrs. Ellis and Wilson.

BOOTLE.—A new wing of the Bootle Hospital, containing four wards, has just been opened. The new wing has been erected at a cost, including fittings, boundary walls, and mortuary, of £8,930. Messrs. C. O. Ellison and Son, MM.S.A., Liverpool, are the architects. On the left-hand side of the principal entrance is a porters' room, with windows commanding the approaches, and on the right-hand are reception rooms for patients, while just within the main corridors are the operation rooms. There are four general wards, with duty-room between and commanding them, although entered from a corridor; also several single-bed wards and specially separated wards for erysipelas cases, all lined, together with the corridors, baths, and w.c.'s, with Minton's tiles, and the conveniences are shut off from the wards by ventilation corridors. In addition to the wards, new rooms are provided for the matron, nurses, and servants, with a dayroom for patients. The entire basement is set apart for the outdoor department, and consists of waiting rooms, surgical and medical examination rooms, operation-room, consulting-room, and dispensary. The heating is partly by hot water pipes and partly open fires. The ventilation is by perpendicular shafts going up alongside the chimney stacks and by horizontal tubes above the ceilings, connected with an air shaft in the tower, through which is carried an iron flue from the boiler supplying the hot water. The work was carried out by the late Mr. Alderman Leslie, of Bootle, and Mr. Wildman was the clerk of works. We illustrated the hospital in our issue of Jan. 21 of the present year.

BOURNEMOUTH.—On Tuesday week the new refuse destructor, which has been erected at the rear of the Cemetery, was formally started in the presence of the Bournemouth Improvement Commissioners. The contract for the destructor and shaft complete was about £2,400 (the contractors being Messrs. Crook and Sons, of Southampton), the system adopted being that of Fryer's. The destructor proper is sunk 7ft. into the ground. The heat from the furnace, and also the clinkers, will be utilised in making bottom coats for the tar paving. The chimney shaft is 137ft. in height, 8ft. 6in. in diameter at the base, and 4ft. 6in. at the top (internally). The exterior of the shaft, for a distance of 25ft. from the cap, is finished in red and white glazed brickwork in diagonal pattern. The plans were prepared by Mr. G. R. Andrews, surveyor to the Commissioners, and the clerk of the works was Mr. Walden, of Boscombe.

BRADFORD, YORKS.—The new Central Post Office, near Forster-square and the old parish church, was opened on the 1st inst. It is Italian in style, and has been built from the designs of Mr. Henry Tanner, of H.M. Board of Works, the contractors being Messrs. J. and W. Beanland, of Bradford. The main front, which is 224ft. in length, is built of cleansed ashlar and stone from local quarries. The building is three stories high, and in the centre there is a turret flanked with Mansard towers. The public office is 60ft. in length and 30ft. in width; it has a mahogany counter, which extends along three sides, and a mahogany writing-desk, 25ft. in length, underneath the windows, divided into 14 compartments, for the use of persons who have to write out telegrams. A room, 155ft. in length, behind the public office, is provided for the letter sorters, parcel receivers, and other servants, and is furnished in pitch-pine. On the floor above, a room corresponding with the public office has been fitted up as the telegraphic instrument room, and in the other portions of this floor are offices for heads of departments, &c. The upper story is set apart as a battery-room. There are two main entrances at the front of the building, beneath the towers, each leading into vestibules separated from the public offices by folding doors. At the southern end there is a portico, where are placed the outside posting-boxes. The basement is mainly utilised as kitchens and store-rooms.

EDINBURGH CASTLE.—The new Government buildings at the gateway of Edinburgh Castle, which are to afford additional guard-room and other accommodation, have just been commenced. The scheme, which has been matured in the Royal Engineering Department, includes the removal of the present approach and bridge, the outer and inner gates, the north and south flankers, with their gun platforms and steps, the straw store, the guard-room, portions of the escarp and main ditch, and of the wall at its northern end. The constructive part of the scheme embraces the erection of a new bridge over the moat in line with the Lawnmarket, the building of a new guard-house, and of a high screen wall on each side, within which will be placed a number of low houses, only one of which will be visible from the Esplanade. The new bridge over the ditch will consist of three arches with drawbridge. The masonry part will be 35ft. in length, and the drawbridge 12ft. The roadway will be 10ft. in width between the walls. Over the entrance will be the new guard-house, built in the Castellated style, and rising just below the Half-Moon battery to a height of 50ft. Beneath the building will be a circular arched courtway, through which the road from the bridge to the Castle will be carried. Over the key of the arch is a large panel, on which the Scottish lion rampant will be carved. The building to the Esplanade will present a solid wall of coursed rubble work, pierced here and there with small loop-hole windows. At the eaves level there is a corbelled and embrasured parapet with gargoyles, on the inner side of which is a narrow passage between it and the higher part of the building. This upper story, at a height of 35ft., shows a second balcony flanked by round turrets. Over this rises the roof, in the centre of which is a crow-stepped gable. The entrances and principal windows of the rooms in the guard-house will be on the Castle side. On the north of the entrance at the ground level is the officers' guard-room, lighted by a window with stone mullions and transoms. On the south side is the men's guard-room, with ceiling 16ft. high, and lighted by two windows. The second floor contains a court-martial room, having a large balconied three-light window, with stone mullions and transoms. This room will be lined to a height of 10ft. with redwood, and above that the walls will be of dressed Dumfries stone. At the extreme north end of the moat a new bridge of three arches and 13ft. in breadth has been constructed, and forms an entrance to the coal yard and straw store. The contract for the erection of these buildings, which will now be pushed on, has been given to Mr. Muirhead, North St. Andrew-street, Edinburgh.

SILLOTH.—The new steam flour-mills of Messrs. Carr and Co., on the north side of Silloth Dock, have just been completed. They are in two distinct blocks, connected by fireproof bridges; the warehouse, with 184ft. frontage to dock, and the mill proper, which consists of five stories, and is nearly 70ft. high from the pavement to the parapet. It is divided into sections, forming a roller mill proper, maize mill, silo for grain storage, engine and boiler-houses, and mechanics' shop. It is fitted with automatic roller milling plant, capable of producing 16 sacks of flour per hour. All the ceilings are filled with Robinson's cement. A third building is the engine house, which is decorated with coloured and glazed bricks and Burmantofts faience. The chimney shaft is 120ft. in height. The premises are lighted by the electric light. Mr. T. Taylor Scott is the architect, and the contractors were: Messrs. Beaty Bros., Carlisle—builders; Messrs. Tweedy, Cairns, and Co., Carlisle—ironfounders; Messrs. Homan and Rodgers, Manchester—fireproof floors, tanks, and engine beds; Messrs. R. M. Omerod and Son, Carlisle—"Robinson's" cement work; Messrs. Douglas and Grant, Kirkcaldy—Corliss engine; Messrs. Hawkesley, Wild, and Co., Rochdale—boilers; Messrs. J. C. Edwards and Son, North Wales—terracotta; Messrs. J. Robinson and Co., Leeds—Burmantofts faience and glazed bricks; Messrs. D. Burns and Co., Maryport—Birkby bricks. Mr. J. Halcrow was the clerk of works. We illustrated the premises by a double-page bird's-eye view in our issue for Feb. 11 last.

TOOTING.—New Roman Catholic collegiate buildings have just been commenced on the Hill House Estate at Tooting, an area of 18 acres, purchased by the Josephites for £20,000. The college buildings proper will cover a ground area of something like 25,000ft., having frontages of 200ft. and 125ft. respectively, the structure containing four stories besides a basement floor, and carried to a height of 60ft. above the ground level. The college chapel will form a distinct building, and the mansion on the estate will be preserved, undergoing, however, internal alterations to adapt it to the purposes of the college. Workmen are now employed in excavations preparatory to getting in the foundation walls, and the superstructure will shortly be commenced. Mr. Wm. Harvey, of Whitehall-place, whose design was selected in a limited competition, is the architect, and Messrs. Higgs and Hill, of the Crown Works, South Lambeth, are the contractors. The estimated cost of the college buildings, exclusive of the outlay for the land, is £70,000.

The foundation-stones of a new chapel and schools for the Wesleyan body at Trent Vale, near Hanley, were laid last week. The new building has been designed by Mr. T. Roberts, of Trentham. The chapel will be 60ft. long by 24ft. wide, and at the rear there will be a schoolroom 43ft. by 24ft., two classrooms being arranged between the buildings, each 15ft. by 12ft. The chapel will accommodate 250, and the schools 350. The exterior will be of red bricks, with blue brick weatherings and plinths. The roofs will be open timbered, the floors paved with wood blocks, and the heating will be on the hot-water principle. Mr. R. Bradbury, of Hartshill, is the builder. The total cost will be about £1,200.

The London, Chatham, and Dover Railway Company are about to proceed at once with the extension of their Nunhead and Blackheath-hill branch, from the latter suburb to Stockwell-street, Greenwich.

The Ravine Bridge in the Belle Vue Park, at Lowestoft, opened last week, was designed by Mr. R. Parkinson, engineer to the Eastern and Midlands Railway Co. It is of iron, with red brick abutments, and has a span of 70ft. and a width of 7ft. between parapets.

The borough surveyor of Eastbourne reported on Monday to the town council that the experiment of watering the streets with sea water has been a success, as the roads get firmer, and remain damp longer after the application of salt water than they do after the use of fresh water.

Mr. Wm. Jenkinson, of Huddersfield, has been elected clerk of contract works by the city council of York from among 46 candidates.

Engineering Notes.

LNWICK AND CORNHILL RAILWAY.—The e line from Alnwick *viâ* Wooler to Corn- on the Berwick and Kelso Railway, was ed for traffic on Monday. It is a single 36 miles in length, and has cost upwards alf a million. The stations are built of e quarried from the cuttings. Their order outh of Coldstream :—Mindrum, Kirk- ton, Akeld, Wooler, Ilderton, Wooperton, geley, Glanton, Whittingham, Edlingham, then Alnwick. The new station at Aln- has a platform 600ft. long by 50ft. wide, large waiting-rooms between the two plat- ns. At the entrance of the station the es are :—Station-master's, ticket and book- offices, and rooms for guards, porters, ps, and luggage. The building is covered n a roof of three spans, and has cost ,000. On the new line the inclines are p—one long one between Edlingham and wick being as much as 1 in 50, and there is iderable cutting, embanking, and bridging. re are over eighty bridges on the line, be- s culverts, &c. The contract was let to srs. Meakin and Deane in October, 1883, but as not carried through, and the railway has n completed by the North-Eastern Railway ctly, Mr. Thomas Harrison, C.E., being neer-in-chief, assisted by Mr. Charles A. rison, assistant-engineer for new works ; E. B. Forbes being the resident engineer. rails with which the line is laid down were ined principally from the Cleveland district e North-Eastern Steel Company, of Mid- brough ; Messrs. Bolckow, Vaughan, and pany ; and the Darlington Iron Company lying the greater portion.

HE ASSOCIATION OF SANITARY ENGINEERS SURVEYORS.—On Saturday a Midland rict meeting in connection with this associa- was held in the Council Chamber, at the n Hall, West Bromwich, Mr. J. Gordon, of ester, presiding. Mr. A. T. Davis, of tford-on-Avon, was appointed district etary, after which the company proceeded sit Messrs. J. and S. Roberts's foundry at n Village, Mr. J. Hamblett's brick and tile s, and also the works in connection with boating lake and swimming bath at Dart- th Park. Upon returning to the Council mber, Mr. Charles Jones, Assoc.Inst.C.E., of ng, read a paper on "Refuse Destructors their Results up to the Present Time." was followed by a discussion.

HE IMPROVEMENT OF THE TEES.—The ks Committee of the Tees Conservancy missioners have under consideration the tion of the improvement of the Tees from illesbrough to Stockton. Mr. Fowler, the missioners' engineer, has prepared a scheme h provides for an extra depth of 10ft., the ision of a turning place for large vessels, a deep-water berth at Stockton. The cost arrying out this scheme would be about 000. Mr. Fowler has been directed to are a scheme on a smaller scale, providing n extra depth of 2ft. and a turning-place deep-water berth. Ships drawing 22ft. water could then be accommodated on a ng tide. The Stockton Corporation have ded to reconstruct their quay at a cost of 500.

he foundation stone of the model dwellings for ans, which are being erected for the Glasgow Improvement Trust on the east side of the Market, was laid on Friday. The ground to cupied by the buildings, including playground out 1,600 square yards—is to contain 12 houses e room, 31 houses of two rooms, five houses ree rooms, and eight single and four double s. The designs were prepared by Mr. Carrick, City Architect, and his assistant, Mr. Mac- ld, and the contract has been taken by Mr. ster. The total cost is estimated at £8,000, the gross rental at £962.

J. G. F. Watts, R.A., is painting a new work resentation to the nation which he has named e Discoverer." It shows a figure looking into distance, with eyes fixed far away, as though ipating the hour of some new invention.

w Board schools in three departments are built in Prætoria-avenue, Walthamstow, designs by Mr. Longmore. The contract has taken by Messrs. Green and Lee, of Hackney.

COMPETITIONS.

DOUGLAS, ISLE OF MAN.—The proprietors of the Twemlow's Yard property have awarded the first premium of £35 to Mr. Clarke, architect, of Liverpool, for the best scheme submitted for developing the property to the best advantage for building purposes. The second premium of £15 has been awarded to Messrs. Stephen J. Holliday, architect, and H. Bertram Nichols, A.M.I.C.E., of Birmingham, joint authors of the plans placed second in order of merit.

KINGSLAND PARK, DUBLIN.—The *Irish Builder* says :—Towards the close of the past year the following architects were invited by the trustees of the "Shannon Fund" to send in designs for a new church of St. Kevin, at Kingsland Park—viz., Thomas Drew, R.H.A. ; A. E. Murray, F.R.I.A.I. ; J. F. Fuller, F.R.I.A.I. ; J. R. Carroll, F.R.I.A.I. ; and A. G. Jones. The fund being under the control of the Court of Chancery, a formal application was made to the Lord Chancellor (Ashbourne) to the effect that the unsuccessful competitors should be remunerated for their time and trouble in preparing drawings. His Lordship, in response, expressed his opinion that professional men should not be asked to give their time and experience without being fairly remunerated, and he accordingly made an order that the unsuccessful architects be paid fifteen guineas each out of the funds in court. As has been already stated, Mr. Drew took first place, and Mr. Murray second.

NORTHAMPTON. — The town council of Northampton have offered premiums of £20 and £10 for the best two sets of designs and plans sent in for the extension of the Town Hall, built in 1864 from designs by the late Mr. E. W. Godwin, F.S.A. Plans of the Town Hall and the adjacent properties, just purchased by the corporation, are being prepared by the borough surveyor.

CHIPS.

At the last meeting of Glasgow town council a letter was submitted from the secretary of the British Archæological Association intimating that the Association proposed holding its annual meetings in Glasgow in 1888, and asking what arrangements and facilities they might expect at the hands of the Corporation.

A peal of eight bells, which have been placed in Dibden Church, Hants, as a Jubilee memorial, were dedicated on the 1st inst. The tenor weighs 10½cwt., and the total weight is over 53cwt. Messrs. Warner, of Cripplegate, E., were the founders, and the total cost, including fixing, was £460. The old bell put up in 1837 has been exchanged for a peal of handbells for the ringers.

The statue of the late Mr. Samuel Morley at Bristol is to be unveiled on Saturday, the 22nd October, by Sir Joseph Weston. Mr. Havard Thomas, of London, is the sculptor.

A new stained-glass window is being erected in the north transept of Canterbury Cathedral, in memory of the late Lord Kingsdown, the eminent equity lawyer, as the gift of Mr. Loftus Leigh Pemberton, his nephew. The scenes in the medallions are illustrative of judicial or legislative acts, and are taken from the Old Testament.

A tablet has been placed on the house No. 42, Lothian-street, Edinburgh, setting forth that there Thomas De Quincey lived when in that city. The tablet, which was designed by Mr. Sidney Mitchell, architect, Edinburgh, is composed of six tiles accurately fitted together—the letters being in ivory white on an Indian-red ground. The inscription is inclosed by an egg-and-dart ornament, also in ivory white. The tablet is placed between two of the windows of the rooms on the second flat, which De Quincey occupied.

The new branch of the Caledonian system to Calderbank and Chapelhill was opened on the 1st inst. It is about three miles in length, but the formation of the line has been attended with considerable engineering difficulties, the chief being the viaduct, 80ft. in height, over the Calder Water. Mr. John Strain was the engineer, and Mr. A. H. Boyle the contractor. The line is to be continued to a junction with the main system at Newhouse by November.

The statue of the Queen at Aberdeen, having suffered from exposure to the weather, is about to be removed from the junction of St. Nicholas and Union-streets to the vestibule of the Court-house. The statue to Sir William Wallace about to be erected in the "granite city" will be erected at the north end of Union Terrace-gardens.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom ; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings ; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—R. and Co.—J. C. and Co.—W. L. Co., Ltd.—C. Bros.—W. and Co.—A. and W.

G. F. M. (Write the Secretary of the Society of Arts, John-street, Adelphi, for particulars as to the Whitworth scholarships. The District Surveyors' Examination is held at the Royal Institute of British Architects, 9, Conduit-street, W.)

"BUILDING NEWS" DESIGNING CLUB.

W. ELLISON FENWICKE A. W. COOKSEY, DAVID M COOPER, L. KITCHENER, AND OTHERS. (We are glad to find that you are so well pleased with our criticisms on the several designs, and that you take so much interest in the club, which will recommence as soon as the holiday season is over. The subjects are printed once a month under "Answers to Correspondents," and 28 days are given for members to prepare their designs given in each list.)—A COMPETITOR THREE TIMES. (Your suggestion shall receive careful attention. The number of subjects set has the advantage of meeting the taste of more members.)—AN ANXIOUS COMPETITOR. (The prizes will be awarded in due course, and very shortly, when the names and addresses of the successful competitors will be published. We have now printed all the illustrations from the present series which we propose to give.)—GEORGE WARD. ("Lightning Conductors," by Richard Anderson, and published by E. and F. N. Spon, 125, Strand, W.C., price 16s., is the book you ask for. We do not know the price of Mr. Jackson's work on "Dalmatia." Write to the publishers, the Clarendon Press, Oxford.

Correspondence.

THE ANTI-SHAM SECT.

To the Editor of the BUILDING NEWS.

SIR,—You quote largely in your article on "Internal Wall Surfaces" in last week's issue from the work of Lord Grimthorpe, who, it seems, pronounces his anathema (we take it for what it is worth, less professional discount) against, I take it, the principle inculcated in Ruskin's "Lamp of Truth." Without expressing an opinion in favour of either view, I do not forget, and am not likely to, the very ignorant remark (pardonable, of course, from an amateur) passed in a certain "Book on Building," which, on the subject of joinery, objects to bolection mouldings because—mark it!—they are shams, and make people think (*who* would think about it?) that the other parts of the door-panels, stiles, and rails *have*

been planed down (!), *and so left them standing.*
—I am, &c., Chas. R. Guy Hall.
15, High-street, Kensington, W.

THE A. A. AT BATH.

Sir,—"The Writer of the Article" has rather misapprehended the gist of my letter. Wood's fame is, I think, both restricted and local, and your writer, in dismissing him with a few lines, scarcely gave him the justice I consider due to him.

It was not that the descriptions of Allen and Wood were untrue, for your writer has fully substantiated his charges; but it was, I hold, unkind and misleading to state merely that one side, seeing that probably the bulk of your readers have no knowledge whatever of the man beyond what they could gather from this particular report, and so are unable to put as an offset the value of his work. For myself, I think the "Essay" bears a more amiable interpretation than what your writer would put on it; but that may be owing to my "personal equation."

Mr. Edwards, I fancy, takes up his pen to answer me without sufficiently considering what I said. No one would single out the *natural* properties of Bath as being specially beautiful. To take instances merely in Somersetshire, are not Clifton and Wells more indulgently endowed?

Although Bath owes its charms in part to other qualities, such as its parks, its historical associations, &c., it is pre-eminently its architecture that has raised it to its deserved place amongst the queens of cities.

If we consider the many elements of beauty—the beauty of grandeur in the hills, of breadth in the plain, of contrasted colour—that Malvern, for instance, has in tenfold degree as compared with Bath, we shall have increased respect for the architect who could invest his hills with the crown that their superiors have not attained. A fair comparison of the "natural situation" only would be with (say) Florence, where the hills and river are disposed somewhat similarly to Bath, in which case the comparison would be vastly unfavourable to Bath. Unless on the grounds purely of architecture, a comparison with Rome is unintelligible; equally so with Jerusalem (as I judge by Seddon's picture in the National Gallery). You might contrast Orvieto with Jerusalem—but not Bath. The influence of architecture in these comparisons is much more deeply felt than admitted.

Mr. Edwards terms my claim for Wood's worth exaggerated; but he misreads it. Wood's conceptions are noted for being grandiose, comprehensive, and in breadth of design comparable to Michael Angelo and Wren; of their other attributes he had little. So, in separating jewels in regard solely to their colour, a garnet may be classed with the ruby, the carbuncle, and the red topaz.

Why Mr. Edwards considers my opinion to be "hastily formed" I don't know; but in the hurry of his correction he fails to note that I referred to Camden-crescent only as a good point from which to see Prior Park.—I am, &c., Halsey Ricardo.

"B.N.D.C." CRICKET PAVILION.

Sir,—As a cricketer of 15 years' standing, and as an architect's assistant, I have naturally examined with much interest "Protoplasmic Globule's" design for the above, published in your issue of the 2nd inst. Against the exterior I have nothing to say; it is most suitable and artistic. But I contend that the plan, although it may be described as ingenious, is bad, and evidently the work of one little acquainted with the requirements of a cricket club. The ladies' accommodation is, however, good—in fact, much too good, for the players' interests are sacrificed. The members' dressing-room is the great blot; it is miserably small. It ought to be not less than 20ft. by 12ft. for a club of 100, and is better even larger. In my club (just 100 members) sometimes over 30 men come up to practise in an evening. It is obvious that a room 11ft. 6in. by 12ft. 6in. is totally inadequate for such a number. The visitors' dressing-room is just large enough, and has actually more floor space than the members. The sanitary arrangements, however, appear to me abominable. There is only one lavatory basin for the common use of visitors and members! That is stuck in a small closet, in the neighbourhood of a w.c. and two urinals. In order to get a wash the men will have to cross the landing of the staircase in *deshabille* and wait their turn. Imagine the chorus of "After you, please!" The visitors ought to have two basins at least, either in their room, or partitioned off from it. Then the members (say, for a club of 100) require, at least, six basins, and one or two bath-rooms, which "Protoplasmic Globule" has not provided at all, although there are plenty of useless fireplaces. The w.c. and urinals should be relegated to the outside. Inside, in that confined space, they are a dangerous nuisance; while it is no hardship to make active young men use outside conveniences in summer weather. The club-room is disfigured with lockers facing the open bar, and box seats. Lockers are quite useless unless placed in the dressing-room; they should then be in two heights, and the room lighted from the roof, or as high up as possible. The visitors' room is frequently used where there is no committee-room; hence the latter might be dispensed with (only being required once a week at most), and the space utilised for dressing-room. No bag-room has been provided by "P. G." What will members do with 30 or 40 bags encumbering the floor? A room, accessible from the dressing-room, ought to have been provided for these articles, with proper racks. Visitors, as a rule, like to have a view of the play from their dressing-room; but, of course, this is not necessary if otherwise unattainable. The terrace slopes at too slight an angle, as anyone with experience of the Lancashire County Ground at Old Trafford can see; the man behind will not be able to see when sitting down. I fear the design would stand a poor chance with a club committee, so little accommodation for members being offered for their money. Thus most clubs prefer the stereotyped plan, even if it should "lack interest," because it is the outcome of experience. I feel quite sure any architect of much cricketing experience will endorse what I have said. Apologising for the length of this criticism,—I am, &c.,
5th Sept. West Lyn.

HOUSE OF SIR WALTER RALEIGH, BRIXTON.

Sir,—The illustrations of the above-named house, which appeared in your journal, failed to convince me of its reputed age, and I therefore went to inspect it. I should suppose the house to be not earlier than the time of Charles II. The assertion of its having been Raleigh's, and that Queen Elizabeth came to visit him in her barge, is, it appears to me, simply trying from two negatives to make an affirmative. The Effra which rose in the immediate neighbourhood, and running down hill, never at Brixton carried anything weightier than air bubbles, I imagine, and cannot certainly now carry the big bubble set upon it. That it ever bore the Queen to Raleigh I really must deny. There is no vestige in the building of anything specially Tudor in character, and the which I should expect to see. The old window openings are quite modern looking, and seemingly intended to fit the sash boxings they now possess. The present remains do not seem sufficiently important for a man so fond of display as Raleigh, and certainly not fitting to invite a Queen to.

I am altogether incredulous as to both stories. I should like to hear the arguments of those who believe in the asserted antiquity of the place.—I am, &c. M.

THE WHITELEY FIRE AND RUINS.

Sir,—As I dared not approach the ruins on my first visit, reported in your excellent paper of the 19th ult., I have been again to see more of the side, or provision departments, and the back.

I am sorry to find that, with exception of the good concrete arched floor over the basement, all above seems to have been joists of wood, resting on iron girders from wall to wall, the floor of boards iron-tongued, and the joists covering with match-boarding underneath, or ceiling. This being so at both ends, and no indication of iron or concrete roof, I presume it, as well as floor, was also of wood. These iron girders and the stanchions are lined or covered with wood, the latter forming large window frames and dividing the shops. The girders across are blocked out with wood, forming the facia, lathed, plastered, and cemented.

With the shops in front, now cleared of fallen wood, &c., I could see the iron doors were twisted out of shape, so that fire could pass through, and how the fire could extend so easily and rapidly.

I write in the past and present tense, as there is plenty of charred remains to show what it was and is, by which it appears little was done to make this provision quarter of the great emporium fire-proof, and that the girders might well bend in the fiery ordeal in this part, and by weight of concrete in the other, for lack of the necessary protection of the iron.

Some of the window openings appear to have had wood lintels on the inside; but burnt clean out. These and the bond timber I saw are not consistent with really fireproof construction; though desired by the joiners, they could be dispensed with.

I venture to recite these deficiencies, the structure being set forth as fireproof. It is so misleading as to the use or propriety of adopting the system so necessary as a saving of the enormous loss of property, and more so in the name of humanity, the terrible sufferings, loss of life, and distress it causes, that can in future be avoided to a great extent by proper means, care, and judgment.

It is distressing to see the destruction of all printing and other machinery in the extensive engine department. This is said to be a loss of about £20,000 alone; there are signs of much woodwork having been used hereabout in floors, &c. Seeing the great masses of brick work fallen hereabouts there need be no wonder at the explosion-like sound when they fell—perhaps on or into a hollow space—especially if, as appears, levered over possibly by one end of unsupported girders away from the walls.

There is a stone staircase surrounded by walls, which, except doorways, appears intact while another in the open building is quite destroyed. This is a small lesson repeated.

The frequently-occurring sad disasters I hope is sufficient excuse, if I add, with your permission, that there seems so little done to make buildings of importance as fireproof as they could and should be, owing, I suppose to the increase of cost and how to do it effectually. Or surely good shops, warehouses, offices, and dwelling-houses would realise a proportionate rent or price for the greater degree of safety from fire with less insurance; and the greater durability would in the long run be economical—for theatres especially.

I say, and mean, with iron columns, girders or other supports, properly protected by incombustible substances, and the many appliances of the present time, there would be very little injury to the structure by burning of the contents only of really fireproof buildings. Such is the opinion of—
Broxbourne, Sept. 6. Jas. Pulham.

THE NUISANCE FROM SEWER VENTILATORS.

Sir,—Mr. Reeves is mistaken if he really supposes I wish to stifle discussion on the matter. I only wish him to write about it in a sensible manner, and so that people reading what he says can understand him. Others besides me cannot make sense of much that he says. His explanations on page 381 of "sewer ventilation, as distinguished from "drain ventilation, are superfluous. On certain points we can reason by analogy from the latter to the former. If Mr. Reeves is unable to do so, so much the worse for him.

I doubt still Mr. Reeves's mere statement that the ventilating pipe he spoke of at first was really wholly clear. His own silence after my reasons for that doubt fully justifies me.

I did answer Mr. Reeves's question about the additional power to be really got by raising the ventilating pipe 10ft. or so. If Mr. Reeves can answer his own question better, let him do so. For my part, I stand to what I said on page 3 until proof be given of error on my part.

Mr. Reeves started with the assertion that stalk pipes were utterly useless as a means of sewer ventilation. He, in my opinion, has utterly failed to prove this. I believe that in many cases—if properly put up, of course—they would be highly serviceable. For small public sewers which men cannot enter or walk through, I have some sympathy for Profes-

Attfield's idea that these might often be simply vented—as a cask is, by a small pin-hole on top—not ventilated. I do not support the idea, however, although I mention it, as showing a feeling in some quarters against over-ventilation of sewers and drains. I put the health and safety of the public before the absurd notion that it is better to leave a stinking sewer grating in street open, even although it should poison several people, than close it and put up a stalk-pipe in a proper manner.

I can believe what Mr. Reeves says on page 382 as to the air going in at the higher points of the sewers, instead of going out as expected; but this would not always be the case. And where did the air that went in go to? Also, what sort of ventilating shafts does he refer to in this case?

Towards the close of his letter on page 382 Mr. Reeves asks me if I could assert that an upward current would be got when the air of the sewer was of 30° or 35° lower temperature than the outer atmosphere; but I would here ask him why he mentions such a great difference, seeing Mr. Baldwin Latham, in his work on "Sanitary Engineering," says:—"So that on an average of the whole year the sewer possessed a temperature of 5·11° only above that of the atmosphere."—I am, &c.,

Glasgow, Sept. 2. W. P. BUCHAN.

CHIPS.

Mr. Julius Spencer, of Keighley, joiner, has been appointed Surveyor and Inspector of Nuisances to the Haworth, Oakworth, and Oxenhope Urban Sanitary Authority. There were 130 applicants.

The death is announced, at his residence, St. John's Wood-road, London, in the 70th year of his age, of Mr. Frederick Bromley, the distinguished mezzotint and line engraver.

A group of cottage homes for pauper children, built midway between Selby Oak and Harbourne, were inaugurated by the King's Norton Board of Guardians on Thursday, the 1st inst. Mr. G. F. Cox, of Temple-street, Birmingham, is the architect, and the homes, which are four in number, and accommodate 80 children, are built of brick with red tiled roofs. Mr. Job Hartley, of Small Heath, Birmingham, has been the building contractor, and Messrs. Currall and Lewis have been the road contractors.

Works of enlargement and renovation are about to be carried out at Stirling Castle under the direction of Col. E. Donald Malcolm, C.B., Commanding Royal Engineer of Scotland.

The ratepayers of the City of York have again refused to adopt the Free Libraries Act, the result being 2,015 for and 2,832 against. Upwards of £5,000 which had been subscribed towards a free library will now be returned to the subscribers.

The Rickmansworth extension of the Metropolitan Railway was opened on Thursday, the 1st inst. The new section from Pinner to Rickmansworth is six miles in length, and there is an intermediate station at Northwood.

In deepening the bed of the river Glen between Pinchbeck and Spalding preparatory to the erection of a new bridge, the workmen found among the foundations of an older structure fragments of carved stonework, the torso of an effigy, broken stone coffin lids, and other débris, believed to be portions of the Spalding monastery, destroyed in 1553.

The work of clearing the site of the new Congregational chapel and schools in Dyer-street, Cirencester, preparatory to building operations, has commenced last week. Mr. G. Scott, London, is the architect, and Mr. J. H. Kingerlee, Oxford, the builder. The edifice will cost upwards of £3,000.

Mr. J. H. Whiteway, of Kingsteignton, South Devon, died at his residence at Teignmouth on Tuesday week, aged 78 years. Mr. Whiteway (trading as Whiteway and Co.) has been the owner for the last 40 years of extensive clay works in the parish, employing some 100 workmen, and shipping off on the average 20,000 tons of clay yearly.

A monument to the late Mr. F. C. Borckhardt, of St. Alban's city, who met with his death on the Matterhorn last year, has just been placed in the English church at Zermatt. It is of stone, with white marble cross, and bears an inscription in English. The relatives of Mr. Borckhardt have also sent out a memorial pulpit to be placed in the English church at Zermatt. It is of carved oak, carried out by Mr. Woodburn, of Liverpool, the brass work having been executed by Messrs. Hart, Son, Peard, and Co., London.

Intercommunication.

QUESTIONS.

[9386.]—**Railway Gauges.**—What is the gauge of the Russian railways both in Europe and Asia, and can one of the readers of the BUILDING NEWS also state the gauge of the Indian railways, and oblige?—AN ENGINEER.

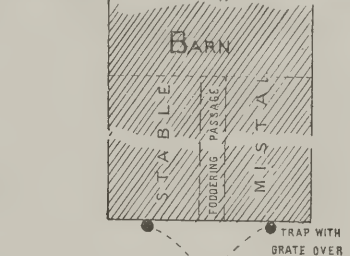
[9387.]—**Civil Engineers.**—What is the necessary education that a civil engineer requires? After completing the studies at the day college for such subjects as required, can you enter an office without serving an apprenticeship?—ANXIOUS ENGINEER.

[9388.]—**Book-Keeping.**—I shall be glad if any of your readers can recommend a good system of book-keeping for architects, and the price of same.—N. C.

[9389.]—**Height of Shaft.**—Will any of your practical readers kindly say to what height a shaft of 4½in. brickwork 22½in. square (2½ brick outside) can safely be carried up above the roof; good mortar and good bricks?—J. M.

[9390.]—**Perspective.**—Can any of your readers kindly inform me how to set Mr. Stanley's centrolinead?—C. H. F.

[9391.]—**Buenos Ayres.**—Can any reader of the "B. N." kindly tell me how to obtain the fullest information with regard to emigrating to Buenos Ayres as an architect and engineer surveyor? Also the best books on the geology and architecture of the country?—IGNORAMUS.



[9392.]—**Surveying.**—A piece of land has an area of 1,000 square yards. One side is 30 yards long, and another 28 yards. I want to know the lengths of the remaining sides, and the rule for ascertaining same.—MINERVA.

[9393.]—**Salisbury.**—Is it possible to ascertain what sort of stone has been adopted in constructing the famous tower and spire? When I examined the upper portion I concluded, too carelessly, that it was Portland limestone from the Chilmark, Wardour, or Tisbury quarries; but not being aware of the great difference in the crushing strength of the three different beds, I did not notice particularly enough the exact nature of the stone used for the four angle piers at the intersection of nave and transepts, and as this is of considerable importance in stability calculations, especially in the case of the weak pier at the S.W. angle, I shall be extremely obliged to "E. L. G." or others familiar with the subject for any information.—WILLIAM GRIFFITHS.

REPLIES.

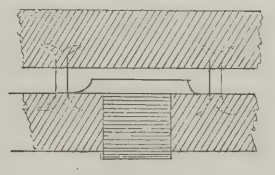
[9348.]—**Boundary Line.**—"G. H. G." is by no means clear unless he admits a joint ownership where both parties repair and maintain the fence; but when the rights of ownership are acknowledged or proved, the owner of the fence can claim 1ft. from the centre, as the fence must stand on his own ground, but according to the law of boundaries any portion of the hedge hanging over beyond that distance can be cut off by the adjoining owner as it is a trespass, but that does not give the adjoining owner any claim on the fence. There is no doubt originally the fence was planted 1ft. within the line, and it is in most districts the custom in setting out plots for building or other purposes to stipulate who shall fence, and that the quickset (if a hedge) shall be 1ft. within the line.—Z.

[9361.]—**Sanitary Stabling.**—As there has been no response from an abler source to what I should have considered an important question—viz., that of keeping the excrement and liquid of cattle away from the building instead of placing dung-pits against outer walls of same, as is too frequently done, I thought as a means of eliciting other replies I would give an example of the plan I have adopted in connection with farm buildings and stables carried out by me during the last sixteen years. In the plan shown the manure pit was placed some seven yards away from end of building, and under it was fixed a tank covered with a landing, hollowed and pierced for a grating to allow the liquid from the pit to sipe into it. The drains from the stands or stalls also delivered themselves into tank, and were cut off from the latter by intercepting traps fixed external to building. By placing the lengthway of tank, the breadthway of manure, place the projecting end of former allows for a pump to be placed outside the inclosure wall for the purpose of raising the liquid at intervals to put on the land as required.—T. PATCHETT, Architect, Halifax.

PLAN

SECTION

[9375.]—**Tall Column or Chimney Shaft.**—The method of calculating the stability of chimneys is given in R. Wilson's "Boiler and Factory Chimneys." Probably, also, the subject is discussed in Bancroft's "Tall Chimney Construction" and Edwards's "Treatise on Chimneys." I have no personal knowledge, however, of these two works. The discussion in the B. NEWS (Vol. XLV.), on the effects of wind pressure on an obelisk may be consulted with advantage.—A. G. T.



[9380.]—**Concrete.**—Assuming that the reduction is to be made in the quantity of cement only, and that the original bulk of cement is required to be retained, the proportions will be—For the blocks, 6·86 to 1, and for the outer concrete, 7 to 1.—A. G. T.

[9382.]—**Soil Ventilation.**—Covering the basement with asphalte will not obviate the necessity of thorough ventilation, as, although it may prevent moisture rising from the soil, it may not prevent, but, on the contrary, will tend to assist, the condensation of the aqueous vapour contained in the air. In any case, it would be advisable to support the ground joists at intervals only instead of allowing them to rest their whole length on either earth or asphalte.—A. G. T.

[9382.]—**Soil Ventilation.**—It is usual, in many cases desirable, to ventilate the space between the flooring boards and asphalte, and to provide for a circulation of air. The underside of sleeper joints should be a few inches above the asphalte. It will not make a good job to run the asphalte on the soil, as hinted in the question. A bed of stone chips or broken bricks should be laid and well pounded down, blinded on the top with fine stuff, and left level for the asphalte. The asphalte should be tempered soft with oil, to form a tough layer, which will yield under any load or settlement before it breaks. The asphalte should be laid regular in thickness, and close to all the brick or stone walls.—CLERK OF WORKS.

[9382.]—**Soil Ventilation.**—It is both necessary and desirable to make provision for ventilating below the joists of ground floor, even supposing the soil is covered with asphalte; and several smaller gratings are better than one or two large ones, in order that there may be no dead corners.—W. P. B.

[9384.]—**Half-Timbered Work.**—I here show a sketch of a half-timbered wall, a plan which I have carried

out in some small villas, for the edification of James Thorneloe, who is inclined to be contentious.—G. H. G.

CHIPS.

The church of Wimborne St. Giles was reopened on Wednesday, after being restored internally by the Countess of Shaftesbury in memory of the late earl.

The Jubilee was celebrated at Southport on Wednesday by the opening of schools of science and art, the public recreation grounds, and the marine park and lake. The cost of the schools was £9,000; the recreation grounds, £3,000; and the marine park and lake, £12,000.

A stonemason, named Curtis, engaged in the restoration of St. Alban's Abbey, on Monday evening fell from the outer high scaffold, and was killed.

Messrs. Arrol and Co., who have obtained the contract for the making of the railway between Queensferry and Inverkeithing, in connection with the Forth Bridge, intend to begin operations shortly.

The Glasgow Archæological Society visited Newbattle Abbey, on the invitation of the Marquis of Lothian, on Tuesday. At the abbey they were received by Mr. Paterson, estate factor, and Mr. Ramsay, clerk of works, who showed them all the objects of interest, particular attention being paid to the foundation of the old chapel, which, on being recently discovered, was laid out as an ornamental garden. The party were afterwards conducted through the abbey, and the magnificent collection of historic paintings and works of art were greatly admired. The party afterwards drove to Crichton Castle, and examined that ruin.

The Elham (Folkestone) Board of Guardians have decided to expend £2,500 in the erection of three cottage homes in the village of Cheriton for boarding out pauper children.

LEGAL INTELLIGENCE.

ANCIENT LIGHTS.—PHILLIPS V. THE CIVIL SERVICE CO-OPERATIVE SOCIETY (LIMITED).—(Before Mr. Justice Kekewich, September 2, sitting as Vacation Judge.)—Mr. Bramwell Davis, for the plaintiff, said that it had been agreed between the parties in this action that the interim injunction granted on August 24, restraining the defendants from raising their building in the Haymarket so as to obstruct the ancient lights of the plaintiff, should be discontinued, and the matter should be referred to an architect, to be named by his Lordship, to assess the damages (if any) caused by the defendants, and to decide who should pay the costs.

BRIDLINGTON QUAY, EAST YORKS.—A court of arbitration will be held at the Alexandra Hotel on Thursday next, the 15th inst., at 10 o'clock, to inquire into the value of the site of the skating rink about to be taken by the local board under their compulsory powers. The court consists of Mr. Harry Jones, of London (until lately a partner of Sir Henry Hunt), acting as umpire; and Mr. F. S. Broderick, York diocesan surveyor, arbitrator for the board; and Mr. A. Scargill, of Sheffield, arbitrator for the owner, Mr. Parker. Counsel and a large number of witnesses have been retained on each side, and it is expected that the case will occupy two days.

IN RE RICHARD CURTIS.—In this case, in which the debtor traded as a builder and contractor, at 100, Aldersgate-street, under the style of Curtis and Co., the first meeting of creditors was held before Mr. Wreford, assistant receiver, last week. The debtor stated that having previously been a surveyor, he in April, 1886, commenced building as above without any capital of his own, but depending on borrowed moneys and advances under his building agreements. Further, that his building operations were unsuccessful, chiefly in consequence of actions in respect of "ancient lights," particularly in the case of his works at Snow-fields. The official receiver considers that the mortgaged property is not likely to realise nearly the amount at which it is estimated by the debtor. The accounts showed unsecured liabilities, £3,348 14s. 5d.; and debts fully secured, £3,594 10s.; against assets (surplus from securities), £2,490 5s., leaving a deficiency of £858 9s. 5d. No offer was made, and the proceedings resulted in bankruptcy, Mr. A. L. Blow being appointed trustee of the estate, together with a committee of inspection.

ARBITRATION CASE AT ELSTREE, HERTS.—(Hancorne *v.* the Barnet Rural Sanitary Authority, and the Trustees of Mr. J. Campbell *v.* Same). The first claim in this cause was for compensation for damages to Mr. Hancorne's leasehold interests in Tile House Farm, Elstree, by the construction, by the Rural Authority, of a sewer through that farm; and the second claim was in respect of the damages to the freehold interests in the property. Mr. Daniel Watney (Messrs. Watney and Sons), surveyer, of 33, Poultry, sat as umpire in both cases. In the first case Mr. Bartley Denniss appeared for the claimant; Mr. Fox for the Rural Authority. The following valuations of the damage were made, in evidence, by experts on either side. For the claimant: Mr. Joshua Baker (Messrs. Joshua Baker and Sons, surveyors, St. Stephen's Chambers, Telegraph-street, E.C., and Kilburn), £945 17s. 6d.; Mr. Buckland (Messrs. Buckland and Sons), surveyor, 23, Hart-street, Bloomsbury, same valuation. For the Rural Authority: Mr. Edward Tewson (Messrs. Debenham, Tewson, Farmer, and Bridgewater), surveyor, of 80, Cheapside, £118; Mr. Charles R. Humbert (Messrs. Humbert, Son, and Flint), surveyor, of 1, Serle-street, Lincoln's-inn-fields, and Watford, Herts), £135 15s.; and Mr. F. Venables (Messrs. Prickett, Venables, and Co.), surveyor, of 60, Chancery-lane, and Highgate and Barnet, £134 8s. The umpire has published his award for £240. In the second claim Mr. Lockwood, Q.C., M.P., and Mr. W. B. Lane were counsel for the claimants, and Mr. Cripps for the Rural Authority. The valuations of the experts were:—For the claimants, Mr. W. J. Beadel, M.P., surveyor, of 97, Gresham-street (arbitrator for the claimants), £3,554; Mr. Robert Vigers, surveyor, of 4, Frederick's-place, Old Jewry, £3,522; Mr. Alfred Savill, surveyor, of 39, New Broad-street, £3,604. For the Rural Authority, Mr. F. Venables (arbitrator), £411: Mr. Charles R. Humbert, £596. The umpire has published his award for £1,752.

Mr. John Jackson, contractor, of Eastbourne and Clement's-lane, E.C., has just signed a contract with the Argentine Government to lay about 450 miles of railway. There are three lines: one northward, from Chilcas to Jufuy, 150 miles; one westward, from Dean Fumes to Chelectcito, 250 miles; and a small branch railway from Chumbicha to Catamarcas, about 40 miles. The lines are to be completed in four years, at a probable cost of two and a quarter million pounds. The permanent way is to be of English manufacture.

WATER SUPPLY AND SANITARY MATTERS.

ACTON, W.—The chairman of the Acton Local Board performed on Friday the opening ceremony of intended new sewerage works to provide the parish of Acton with a complete system independent of the sewers of the Metropolis. The area of the parish comprises a high and low level district, situated respectively north and south of the Uxbridge-road, the works for purifying the sewage being situated in the lowest part of the parish. The sewage from the high-level district runs into the works through an egg-shaped sewer, 3ft. by 2ft.; and that from the low-level through a circular sewer, 2ft. 6in. in diameter. The sewage is then pumped up by two 35H.P. engines into a channel leading to the tanks, where it is mixed with chemicals and then run into the tanks to allow all solid matter to settle. The purification is effected by a combined process of precipitation and filtration, a special feature being the absence of lime in the ingredients used for this purpose. The material used for precipitation is the magnetic ferrous carbon and compound sewage salts supplied by the International Purification Company. After precipitation in the tanks the surface liquid is passed through a filter-bed composed of granulated magnetic spongy carbon, and the effluent is discharged by an outfall sewer into the River Thames. The sludge left at the bottom of the precipitation tanks is run into a well at the back of the chemical buildings, from which it is pumped up by a small engine and forced through Drake and Muirhead's patent sludge presses, after which the solid cake is passed into the adjoining room to be dried and ground for manure. The works, which have been carried out under the direction of the local board by Mr. W. N. Lailey, the board's engineer, are capable of treating the sewage of a population of 20,000 persons. The undertaking has necessitated an expenditure of £100,000.

CHICHESTER.—Major Hector Tulloch, Inspector for the Local Government Board, held an inquiry on Tuesday last respecting an application made by the corporation of Chichester for sanction to borrow the sum of £2,250 for the erection of an infectious hospital. The city surveyor, Mr. Stringfellow, produced the plans, which the inspector stated had received the approval of the Local Government Board. Considerable opposition was raised by members of the Ratepayers' Association and others as to the site selected by the council, and alternative sites were suggested, which, however, did not appear to favourably impress the inspector.

CODNOR SEWERAGE.—A meeting of the ratepayers of this Derbyshire district was held last Monday to consider a scheme of sewerage submitted by Mr. W. H. Radford, C.E., of Nottingham, as an alternative to one previously drawn out by the surveyor to the Basford Guardians, who are the authority in the district. The ratepayers unanimously approved Mr. Radford's scheme, being the cheapest and most efficient in their opinion. Cost of works, £3,900. The Basford Guardians last Tuesday decided to send the two schemes to the Local Government Board, accompanied by an intimation that the local vestry preferred Mr. Radford's, and asking them to choose the best scheme.

HALIFAX.—Pursuant to instructions from the Corporation of Halifax, Mr. Geo. H. Hill, of Manchester has made a report on the present and future capabilities of the waterworks, and the necessity or otherwise of extending the works, and in what direction. His conclusion is that the present works can be relied upon, in years of severe drought, to give but little more than four million gallons per day. If deficiency in storage can be provided, 5½ million gallons per day can be obtained. In fifteen years from the present time from 6½ to 7 million gallons per day will probably be required for the present district of supply.

LEICESTER.—It was announced at Tuesday's meeting of the town council that the Local Government Board have authorised the following loans:—£10,400 for distributing carriers, effluent water culverts, drainage, and roads; £18,200 for trunk sewers and the purchase of a site for the pumping-station; £33,050 for the general works of sewage disposal (pumping station, rising mains, &c.); and £33,150 for machinery; and further that they are prepared to allow the execution of the works, except so far as regards the proposed overflow-culverts for relieving the sewers in times of heavy rainfall by the discharge of water into the Soar. It was decided to proceed at once with the sewage disposal scheme. The Water Committee reported at the same meeting that they were considering as to the best source of an additional water supply, and also whether any temporary augmentation of the present supply should be provided, and as to available sources, and requested the council to authorise them in their investigations and inquiries to consult the borough surveyor, Mr. J. Gordon, when thought necessary. This was agreed to.

STATUES, MEMORIALS, &c.

CHESTER.—Memorials have been built in the north aisle wall of choir in this cathedral to the memories of the late bishop (Dr. Jacobson) and the late dean (Dr. Howson); they are both executed in the local red sandstone, and are flush with the face of old wall. The late bishop's memorial consists of two panels, divided by a transom, the upper one containing an excellent medallion by Mr. Boehm, R.A., mounted in a solid Dove marble frame; the lower panel contains the inscription. The late dean's memorial is a single panel, surrounded by a decorated, enriched moulding, inclosing a brass. Both have been carved from directions of the cathedral architect (Mr. A. W. Blomfield, M.A.), by Mr. Wm. Haswell, Magon, Chester.

PARLIAMENTARY NOTES.

THE ADMIRALTY AND WAR OFFICES.—In Supply on Tuesday night, on a supplemental vote of £18,500 for the preparation of plans for the erection of new offices for the Admiralty and the War Departments, Mr. Dillwyn moved the reduction of the vote by £9,000. After some remarks by Mr. Shaw-Lefevre, Mr. Plunket said that he was asked in the Committee to find money for the preparation of plans with a view to carry out the recommendations of the Committee that had considered the subject. He did not wish to commit the House to any approval of the sketch plans of extension prepared by Messrs. Leeming and Leeming. The amendment was by leave withdrawn, and the vote was agreed to.

CHIPS.

It has been decided that a new Liberal Club shall be erected for Colne, Lancs. The building, which will be erected in New Market-street, will accommodate more than 1,000 persons. The architect is Mr. Parsons, of Burnley.

The parish church of Gladsmuir, destroyed by fire in March, 1886, has just been rebuilt, and the new edifice was opened on Sunday. The new building seats 600 persons, and the work has cost £2,500.

Mr. G. A. Wood, head master of the School of Art, Hertford, has been appointed to the head mastership of the Sidney Cooper School of Art Canterbury.

The town council of Middleton, near Manchester have applied to the Local Government Board for power to borrow £2,000 to purchase land for pleasure grounds and Free Library site, and £1,000 for site for Municipal Buildings. A sub-committee has been appointed to consider the sewage question and it has been suggested that it would be to the advantage of the borough to join the Manchester sewerage scheme.

A meeting of the directors of the Clyde, Crinan and Ardrishaig Railway was held in Lochgilphead on Monday, when orders were given for laying out the line, to Mr. Forman, the engineer, who is now on the ground.

Four Glasgow churches—Free St. Matthew's, Free West, Cathedral square United Presbyterian and Frederick-street Baptist—were reopened on Sunday after having been renovated.

Several old buildings situate between the Wakefield and Lanthorne towers have been demolished in the Tower of London. They were used as prisons and as places for administering the rack, the wheel, and other methods of torture, down to the time of James II. Of late years they have merely been occupied as store rooms and warehouses for the purposes of the garrison.

The memorial stones of a Wesleyan chapel which is being erected at Sutton Coldfield, were laid on Monday. The chapel, which stands at the corner of Newhall-street and the Parade, is to be built in the Early English Gothic style, from the designs of Mr. Thomas Guest, of Birmingham. Seating accommodation will be provided on the floor for 300 persons, and a gallery will seat 2 more. The size is 37ft. by 54ft., exclusive of apsidal chancel. Beneath the chapel a school-room, with classrooms, steward's vestry, and lavatories, will be provided. The materials are pressed brick facings with Bath stone dressings. The total cost £1,675.

A set of oak choir stalls has been placed in Brewood Church by a former parishioner in commemoration of his residence in the neighbourhood for 23 years. They were constructed by Jones and Willis, of Birmingham and London.

Good progress is being made with the second section of the Eltham Valley Railway, now being made by the South Eastern Company between Shorncliffe and Canterbury. The first section, that between Shorncliffe and Barham, has just been opened. Mr. Wright is the chief engineer, and Mr. F. Waller the mechanical engineer.

Our Office Table.

THE lamentable loss of life at Exeter heatre on Monday night affords a fresh proof at with every precaution that can be devised y experienced specialists in the way of wide d numerous exits, there is no effectual way protecting a panic-stricken crowd from locking themselves in, and that even iron drop rtains would but delay the progress of flames hen once fire has broken out in a theatre. hree times within seventy years have theatres Exeter been destroyed by fire. When the old ouse in Bedford-circus was burnt down in ebruary, 1885, it was decided to consult Mr. C. Phipps, F.S.A., in preference to a local archi- ct, on the ground that he had made the design- g of places of entertainment a special study. he building was constructed on a new site, olated on three sides, in stone and red brick, at a st of £5,500, and was opened in October of last ear. In size the auditorium was rather larger an that of the Olympic in Wych-street, London, nt the stage, dressing-rooms, and vestibule were ore spacious. The regulations of the Metropo- tan Board of Works were carried out by Mr. hipps in every particular. The weak point in e planning, as at the Victoria Hall, Sunder- nd, proved to be the gallery stairs, which were ivided by a central wooden handrail, and con- sted of 42 steps with three intermediate land- gs, the flights being at right angles and ithout winders. Among the many sugges- ons made by correspondents for the prevention f similar disasters in the future, the most prac- cally useful one is to substitute the electric ght for gas, thereby preventing the beginning a conflagration ; and a second, of little less alue, to protect the stage fittings and artists' resses by saturating them with tungstate f soda, or some other of the so-called incom- ustible solutions. The fire at Exeter, as in ost theatre burnings, broke out among the enery, and although the details will never be nown, was, there can be little doubt, due to ntact of tinder-dry canvas with a gas- ame.

MR. J. J. HISSEY, of Eastbourne, supple- ents Prof. Tyndall's recent letter on the roper mode of constructing lightning con- uctors with a few simple but useful sug- estions of precautions. Mr. Hissey recom- ends that, to insure as far as possible perfect rotection, all iron or lead work on the roofs buildings should be in connection with the nductor ; that where the chimney-stacks are rge the ordinary point should not alone be lied upon, but a copper band as well should carried round them ; that the conductor ould be nailed to the building, and on no count disconnected from it by means of glass porcelain holders, which are worse than eless ; that continuous copper bands should employed in preference to wire rope ; and nally, that the conductor should terminate in large copper plate (as Prof. Tyndall advises), is plate being placed deep in the earth, so as insure as far as possible the ground around being always moist.

A SPECIAL feature of this year's exhibition connection with the Royal Cornwall Poly- chnic Institution, which was opened at Fal- outh by Lord Robartes on Tuesday, is the lustration of the potting materials and ttery of Cornwall and Devon. These counties e the sole source of the china clay and stone the United Kingdom, the production ex- eding 300,000 tons a year, and the Newton strict of Devon, with Dorset, are the chief urces of supply of pipe or potter's clay to the affordshire potteries. At the Falmouth Ex- bition, Messrs. Martin, of the Lee Moor Clay orks, make a typical display of clay and stone id the various by-products. The Chytane ina Clay and Brick Works show tiles, fire id architectural bricks, and blue vitrified ving. The St. Day Fire Brick and Clay mpany, Mr. E. A. Martyn, of St. Porth, dis- ay building and paving bricks. Mr. Johns, Falmouth, illustrates the manufacture of ilding bricks. Among the art pottery stands ay be noted the Royal Barum ware shown by r. Brannon, of Barnstaple ; the Aller Vale re by Messrs. Phillips ; the Watcombe racotta from Torquay, and Bovey Tracey ttery. Mr. Harry Hems, of Exeter, shows a life-size bust in Italian statuary marble of the late Ven. H. Woollcombe, archdeacon of Barnstaple, destined for the hall of Ashbury House, North Devon.

IN reply to Mr. Walter Emden's complaint as to the neglect of the Metropolitan Board of Works to deal with plans deposited for approval a fortnight before the Board adjourned for the recess, the Hon. A. de Tatton Egerton, M.P., explains that the whole of the building business of the Metropolis is not brought to a standstill by the vacation. The Building Acts are administered by the district surveyor, and only special cases of great responsibility are reserved for consideration by the Board. Mr. Emden rejoins that while no doubt the responsibility for theatre plans is great, he does not understand why a body of gentlemen, for the most part with no practical knowledge of such subjects, should be more capable of deciding what is necessary than their officers, who hold their position because of their special knowledge as practical experts. The present routine, he reiterates, involves great and unnecessary delay and loss of time and money to the building public.

THE catalogue of the 17th amateur exhibition of pictures held under the auspices of the Liverpool Corporation opened on Tuesday, has, by a singular coincidence, exactly the same number of entries as last year, 1,279. Of these pictures 60 are from the Royal Academy, 40 from the Grosvenor Gallery, 50 from the Royal Institute of Water Colour Painters, 15 from the Royal Water Colour Society, and 20 from the Royal Society of British Artists, while there are also some works from the New English Art Club. Besides these, there are fifty works specially painted for this exhibition. One of the more ambitious works is Solomon J. Solomon's "Samson," which has a special interest, as having been added by Mr. Atkinson's generosity to the permanent collection in the Walker Art Gallery. "Impressionist" works make a strong display, and include J. S. Sargent's "Carnation, Lily, Lily Rose," purchased by the Chantrey Trustees ; "Oriental Poppies," by W. J. Hennessy, and W. Stott's "Summer." Landscapes form a large proportion of the canvases, and portraits a relatively smaller one than usual ; but the water-colours are numerous, and, as a rule, excellent in quality.

A SELECTION from early Chinese and Japanese illustrated books is now arranged in cases in the King's Library of the British Museum. The selection has been made with a view to showing the close connection between the artistic schools of China and Japan, as art in both these countries had its origin in the attention paid to caligraphy, it being but a short transition from drawing the ideograph of some object to the picture itself. The first case is devoted to specimens of block printing, the forerunner of wood-engraving. Here are shown the earliest known specimens of printing—namely, three bahrani of the Chinese version of a Buddhist Sutra, printed by order of the Empress Shiyautoku, as early as 770 A.D. An early example (1337 A.D.) of printing from movable types from the Korea is the version of a Chinese encyclopædia, and specimens of Japanese block-printing, of the 14th century, are also on view. Among the more beautiful specimens is a volume of the Great Imperial Encyclopædia (A.D. 1726), in 5,000 volumes, one of the treasures of the British Museum, the illustrations in which are excellently executed. In the other cases are specimens of Japanese engravings of the Sesshin, Kano, and Korin schools, many of them illustrating Buddhist legends and details of Japanese life. Special mention must be made of the works of the artist Makio Ken (1771 A.D.), and of his faithful drawings of Japanese life. A concise handbook to the selection has been prepared, containing an historical sketch of the development of Japanese art.

MR. JOHN WILLIAMS, of Hendresytham, near Llantrissant, engineer of the Taff Vale Railway, died on Monday in London, aged 67 years. Mr. Williams was for many years connected with the Taff Vale Railway as engineer and land valuer for the company as far as new works were concerned, and he had the responsibility of carrying out all matters connected with Parliamentary proceedings of the company. He went to Cardiff in 1846, and assisted Mr. Brunel in the construction of the railway from Cardiff to Pontypridd. He then went with Mr. Brunel and assisted him in the construction of the Bristol and Exeter and Somerset railways. He was only absent three years, when he returned to Cardiff again, connected himself with the Taff Vale Railway Company, and has been connected with it ever since. He was the engineer and superintended the construction of the Dane Valley, the Llantrissant and Treforest, and other branch lines in connection with the Taff Vale system.

THE New York Board of Health has just revised the plumbing rules by the light of the experience gained since they were promulgated in 1881 and after obtaining the view of the Master Plumbers' Association of that city. The amendments are all in the direction of greater stringency, and it is worthy of attention that all plumbers practising their business in New York are registered, and have to renew their license annually. Iron pipes are specified for all house-drains, and these are to be "extra heavy" where it passes over filled-in or made ground. A curious item in the revised regulations to English eyes is an explicit authority to the Board of Health to omit in some cases the trap, which, according to another rule, is to be of the "running or half-S form," from the main house-drain. If after the filing of plans the proposed work is not begun within six months, the authorisation lapses, and the approval of the board has to be again obtained—a rule devised to defeat attempts by jerry builders to fraudulently change the scheme after approval has been obtained, trusting to lapse of time to enable the work to pass unchallenged.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY.—Society of Architects. Special general meeting at the Society's Rooms, St. James's Hall, Piccadilly. 7 p.m.

ARCHITECTURAL ASSOCIATION,

9, CONDUIT STREET, W.

Visit to "Ascot" and "Mentmore."—The train will leave Euston to-morrow at **1.0** p.m., instead of 2.15, as announced last week.

The Last Vacation Visit will be paid on Saturday, September 17, to Minley Manor, Hants (Messrs. Devey and Williams, architects), and "Bramshill," one of John Thorpe's celebrated houses.

Train from Waterloo at 11.45 a.m. Names of those who wish to go must be sent in to W. J. H. LEVERTON, 15, Whitehall-place, before WEDNESDAY, with Postal Order for 3s. 6d. and stamped envelope.

THOS. EDWARD PRYCE } Hon. Secs.
FREDERIC R. FARROW }

SOCIETY OF ARCHITECTS.

A Special General Meeting of the Society of Architects will be held in St. James's Hall, Piccadilly, on TUESDAY, September 13th, 1887, at 7 o'clock p.m.

EDGAR FARMAN, Hon. Sec.
G. A. T. MIDDLETON, Secretary.

CHIPS.

Foundation stones of a new Free Methodist chapel were laid at Yatton, Somerset, on Monday. The chapel is to be Gothic in style, and seated for 200 persons. Mr. W. A. Green, of Clevedon, is the contractor.

A large hotel is about to be built on the Ocean View Estate, near Felixstowe station, from plans by Mr. A. J. Butterworth, jun., of Ipswich and Felixstowe. It will have a frontage to the sea of 136ft., and contain 40 bedrooms, besides other apartments.

Dr. Francis Edmond, of Kingswells, has presented to the trustees of the Aberdeen Art Gallery a portrait of John Philip, R.A., and his wife, painted by the artist himself. Two fine engravings by Barlow of paintings by Philip have also been added to the same collection.

Mr. Joseph Maltby Bignell, architect, died at his residence in Orland-road, Clapham, at the age of sixty years. For the past three years he had been incapacitated from the exercise of his profession by ill health.

Holy Trinity Church, Birkenhead, was reopened on Sunday after renovation and decoration. Messrs. E. Legge, Son, and Co., of Birkenhead, carried out the works.

In the list of Scotch sequestrations, the name appears of W. G. Wilson, Glasgow, architect, the first meeting being fixed for Monday next, at the Faculty Hall, Glasgow.

The foundation stone of a new Dominican priory will be laid at Newcastle-on-Tyne to-morrow (Saturday) afternoon. The priory will be built of red brick with terracotta, and will, when completed, cost £8,000. Messrs. Dunn and Hansom, of Newcastle, are the architects, and the contract for the first section of the work has been taken by Mr. Foster, of Croxdale, at £3,000.

CHIPS.

The following dissolutions of partnership are announced in Tuesday's *Gazette*:—Strode and Co., Osnaburgh-road, Regent's-park, and St. Paul's Church-yard, gas engineers, as far as regards J. Mackenzie; and Hunt and Ellis, Maresfield-gardens, Hampstead, builders, as far as regards W. Hunt.

The *London Figaro* gives in its issue of Sept. 3rd a portrait and biographical notice of Mr. Thomas E. Collcutt, the architect of the Imperial Institute, who is described as "a coming man who is exceedingly likely to achieve, by the exercise of his own gifts, world-wide and enduring celebrity."

The ceremony of laying the foundation-stone of the Jubilee Clock Tower, to be erected at Gravesend in commemoration of the Jubilee, was performed on Tuesday by the Mayor.

On Tuesday morning considerable interest was manifested in the ascent of St. Mary's steeple, Bridgwater, by a steeple-jack named Parker, of Oldham, employed by Messrs. Trask and Son, of Ilminster, the contractors for the tower restoration. The ascent was successfully accomplished in about two hours.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, post free.—LESSER FRIEDLANDER, Tobacconists' Complete Furnisher, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 60 years.

Holloway's Ointment and Pills are infallible for curing bad legs, varicose veins, swelled ankles, erysipelas, scaly skin, and every variety of skin disease. Over all disorders Holloway's remedies exert a quick and favourable action, and where cure is possible gradually but certainly arrive at that consummation. They are invaluable in the cure of scrofula and scurvy.

HYATT'S LENS and "SEMI-PRISM" LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

ACTON GREEN.—For the erection of the first portion of the proposed Church of St. Alban the Martyr, Acton Green, London, W. Mr. E. Monson, jun., A.R.I.B.A. Grosvenor House, The Vale, Acton, W., architect:—
Dorey, J., Brentford (accepted)... £3,500 0 0

ACTON GREEN.—For the erection of five cottages in Montgomery-road, Acton Green, W. Mr. E. Monson, jun., A.R.I.B.A., Grosvenor House, The Vale, Acton, W., architect and surveyor:—
Thomas, G., Acton Green, W. (accepted) ... £1,075 0 0

BARNET.—For coach-house and stable, for Mr. Emm. Mr. E. B. Julian, architect:—

Gray	£165 0 0
Roger	165 0 0
Marriott Bros. (accepted)	140 0 0

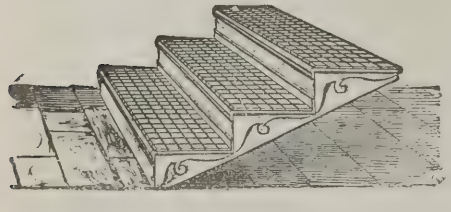
BARNET.—For alterations, Lyonsdown, Barnet. Mr. A. Allen, architect:—

Dainton	£1,965 0 0
Ellwood	1,795 0 0
Wilkins	1,565 0 0
Marriott Bros.	1,560 0 0
Ansell	1,555 0 0
Mattock	1,491 0 0
Noble	1,472 0 0
Harris	1,227 0 0
Richardson, J. O.	1,221 0 0

BERMONDSEY.—For new shop on forecourt and sundry alterations and repairs to house and shop, No. 234, Southwark Park-road, for Mr. W. H. Jacks. Mr. E. Crosse, 32, Bermondsey-square, S. E., architect:—

White, A., and Co., Rotherhithe ...	£195 0 0
Almond, J., Bermondsey	185 0 0
Smithers, G., Bermondsey (accepted)	180 0 0

BERMONDSEY.—For rebuilding to back additions and underpinning walls and piers, and new water supplies to houses, Nos. 46 and 48, Camilla-road, for Mr. H. Haukin. Mr. E. Crosse, architect:—



White, A., and Co., Rotherhithe ...	£196 0 0
Smithers, G., Bermondsey	187 0 0
Almond, J., Bermondsey (accepted)	185 0 0

BEDDINGTON.—For proposed alterations and repairs Brandries Hill House, Beddington. Mr. C. Innes, 27, Queen-street, City, architect:—

Prestige and Co., Pimlico	£3,819 0 0
Dawson and Son, Beddington ...	3,818 0 0
Maides and Harper, Croydon ...	3,752 0 0
Smith, J., & Sons, South Norwood	3,597 0 0
Macey and Sons, Strand	3,327 0 0
Messom, T. J., Twickenham ...	3,195 0 0

BLACKBURN.—For the painting inside of the offices, staircase, and corridor, at Richmond Chambers:—
Cunliffe, W. H.... ... ... £41 15 0

HAWKSLEY'S PATENT TREADS.
Proprietor & Manufacturer: J. WESTWOOD, Jun.

NAPIER YARD, MILLWALL, E.
Telegraphic Address—"Westwood," London. Telephone No. 5065.

Recommended for durability, simplicity, firm footing, elasticity, and are perfectly noiseless; they excel lead, oak, teak, or stone; applicable to wood and iron staircases, new and worn-down stone stairs, spiral and other staircases, footpath flaps to cellars, covers for drains and coal-cellars, flooring for public buildings and aisles of churches, &c., &c.—The best and most durable Tread or Step yet invented.

VOL. LIII.—No. 1706.
FRIDAY, SEPTEMBER 16, 1887.

REBUILDING SCHEMES.

THE demolition of whole streets of houses and the formation of new thoroughares have much changed the western parts f London. New routes have been opened hrough neighbourhoods which not long ago ere dense and squalid in the extreme, but in hich trade of a superior class is being carried n. The district most affected by recent alteraons is that lying to the north and east of rafalgar-square. Charing Cross-road, which asses through a very densely-populated part nd intersects several thoroughfares, such s Cranbourn-street, Newport-street, and haftesbury-avenue, has brought into promience several obscure blocks of buildings hich scarcely before had the honour of asking in the sunshine. Till lately they ere shut out from the public gaze, obscured y adjacent buildings of a manufacturing lass, and their architectural pretensions were nsignificant. All at once they have been exosed to view and to traffic; their value as roperty has immensely increased. A great any of the old premises abutting or facing he new road are not much better than actories and third-class shops, and will have o give place to new and important buildings ooner or later. Immediately behind the ational Gallery these properties are cut at considerable angle, and along the line of ew road we may count not fewer than half--dozen sites which are now to be let for uilding purposes. One long strip of land, n the hands of J. Grover and Son, builders, ot far from the National Gallery, is to be uilt on, and buildings to suit intending enants are to be erected, and for manufacuring and business purposes the sites are well dapted. Farther northwards is Cambridge-ircus, where Charing Cross-road and Shaftesury-avenue cross each other. The vacant sites re especially valuable here, as the frontages re large. Boards announce that buildings will e erected to suit intending occupants. Mr. itzroy Doll, architect, of Gower-street, and Messrs. Martin and Purchase, architects, of ueen Victoria-street, have important corner ites to deal with. In all, there were sixty ites in these new thoroughfares which the Metropolitan Board of Works had at their isposal, and twenty-five corner plots all to be et on 80 years' lease, and comprising an area n the whole of three acres. We may venure to hope that the Metropolitan Board of Works will exercise their power in preserving ome degree of harmony in the elevations of he new buildings as to general treatment nd height. In the circus particularly there s an opportunity of carrying out a complete esign in the different quadrants. John Nash as intrusted with the design of Piccadilly nd Regent-street; why should not a general esign for the quadrants be carried out in his case? The authorities could very easily ave made this a condition of leasing the nd.

Very shortly another measure is likely to e carried into effect which will greatly tend o alter the present appearance of Westminster. We allude to the Westminster arliament Street Improvement Bill, which roposes to authorise the widening of Parament, Charles, and Delahay-streets, and the aking of new thoroughfares. By this Bill arliament-street is to be widened on the estern side, Charles-street is to be widened n the south side between Parliament-street nd Delahay-street; the latter street is to be idened on the east side, and two new streets made, one from Charles-street to Great George-street opposite Little George-street, and the other made partly upon the site of the latter, terminating in Broad Sanctuary. The unopposed passage of the Bill through Committee the other day we announced. The Bill empowers certain individuals named to carry out the scheme, and its effect will be to alter the whole area between the new Government offices and Great George-street. Without doubt the contracted entrance from Whitehall to the Houses of Parliament quite destroys and impairs the stately width of Whitehall, to which it forms a narrow neck. By the abolition of King-street, an entrance worthy of the great Government thoroughfare may be made; but the street had better remain as it is than that the site should be handed over to speculative builders. We have nothing to say against a plan that will widen the approach and will lighten dreary and narrow streets by a new street from the Broad Sanctuary to Charles-street; but at all costs we trust the scheme of the undertakers will be a real improvement, and that the architectural taste may be worthy of the occasion. The framers of the Bill, it is true, have made it a provision that the plan and designs shall be approved by Her Majesty's Commissioners of Works, and be in harmony with the Home and Foreign Offices; but we all know what official architecture generally is, and the kind of harmony that is striven after. Those offices themselves, the result of a compromise, are by no means equal to the genius of their architect, or worthy of the Government who empowered him to turn a Classicist for once in his life, and if the new entrance to Parliament-street is made to agree with them, we are inclined to doubt whether monotony and dreariness will not be repeated. We should have thought that the widening of Parliament-street was enough at a time, without the opening of a new street to the Broad Sanctuary. If the block which encroaches on the view and roadway on the west side of Parliament-street were removed we hardly see the necessity of making a new street further westward. In Bills for alterations of important sites, especially those affecting several public buildings, the public have a voice. The widening of approaches and thoroughfares is now called for, even when the sacrifice of ancient and historic buildings is at stake; but do not let us pull down until we are quite sure the change is to be an improvement. If old landmarks must be removed to make way for increased traffic it ought to be undertaken with the greatest caution, and not before seeing the effect of the change. The Metropolitan Board of Works or their professional advisers have wisely adopted the plan of getting models of the schemes prepared, as they have done in the Piccadilly-circus scheme, to which we referred last week. We are sure that no plan of a site unaccompanied by accurately-drawn views and models can give a proper or adequate notion of a change that is contemplated. The process of widening a street even is not always an unmixed advantage; we lose something of the interest and associations that cling to buildings which nestle near great public edifices; the partial glimpse of a great cathedral or public building is more gratifying to the eye than a sudden disclosure of the whole of it. In a word, the picturesque elements are destroyed. Some time ago an able plea was advanced on this ground for not opening up the area round St. Paul's Cathedral, and the same plea can be urged in all cases of street improvement. Public convenience is, however, very exacting. All that we ask in return for these alterations is that an effort should be made to see that they are really designed in a sufficiently liberal spirit, and do not mar the buildings in the locality. The study of the elevations ought to be taken into as much consideration as the plan, and the latter ought not to be settled till the general perspective of the grouped buildings from several points of view has been seen.

THE CUBING OF PUBLIC BUILDINGS.

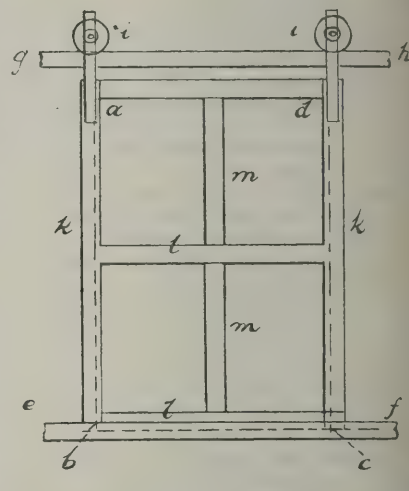
THE plan of obtaining approximate estimates by the method of cubing has now attained to something like a system. At first it was a very tentative and by no means reliable method of estimating buildings. Surveyors and architects of the past generation used to carry in their pocket-books a few of these golden rules of calculating, little imagining that in later times the rough-and-ready cube unit would become a general mode of arriving at approximate estimates, and be introduced into text-books and figure in Government reports of Select Committees. The experiences of a generation or two have enabled the profession to arrive at tolerably accurate rates of cubing for different classes of building, though it ought not to be overlooked that a particular locality may very materially impair the correctness of this mode of estimation. The rates must be taken as general guides in forming an estimate of cost, and in all cases the experience of the architect can alone give value to the system. Then the cube rate cannot be relied upon for work of exceptional elaboration. The cubes generally published are intended to apply chiefly to buildings of a plain character in their several classes, and it would be of value if this circumstance were taken into account in fixing upon the rate. Precision can, however, only be attained by a generalisation from extensive experiences, and the evidence which appears in the report of the Select Committee on the Admiralty and War Office sites affords some very useful information from an official source. We may here allude to the instructive evidence given by Mr. John Taylor, the Surveyor of Public Buildings in Her Majesty's Office of Works. In his examination on the estimate for the new blocks of building behind the present Admiralty, that gentleman is reported to have said that the cost of a plain brick building would be at the rate of a shilling per cubic foot. Now this may be taken as a fair rate for a large public building on an open site such as that alluded to. In this plan a large quadrangular court is shown with a screen or colonnade, to which we recently described in referring to Messrs. Leeming's able alternative design, prepared at the suggestion of the committee. This court is not included in the superficial area taken of building, though it would have to be drained and paved, and the colonnade would also be a rather expensive item. The actual building area covered in this estimate is 45,250 superficial feet, while the open court is 195ft. by 155ft. We leave our readers to make the average rate per cube foot under these circumstances; the actual building or covered space would, of course, work out something less per foot than a shilling. We simply refer to the figures given. Messrs. Leeming's design was also taken at the same rate, with certain additions for portions that could not be cubed conveniently, such as the ornamental portions, which are lumped. Mr. Taylor stated that, taking the work all round, including the extras, the rate was a shilling, or thereabouts. Then, comparing the rates for a five-story and a four-story building, the additional story somewhat reduces the cost per cube foot, so that an ornamental exterior like that of Messrs. Leeming's first design would not be necessarily more expensive per foot than a plain building one story less in height, as was elicited by Mr. Shaw-Lefevre. A great deal of valuable evidence was given as to the matter. Further on in the report we find that 1s. 2d. is taken as the cost per foot cube for a plain building, but including all arrangements for ventilation, electric lighting and other provisions. We may quote a portion of the question of Mr. Isaacs and reply

thereto, as relating to this question of cubing: —"Having regard to the character of Messrs. Leeming's building, and the fact that the whole of the façade is to be in stone as against the façade being in brick, does it strike you that the figure in one case bears no comparison with the figure on the other—the 1s. 2d. against 1s? But I take it that if everything in the nature of open spaces and courts were taken in this design as they have been in plan A, this would come to more than 1s. per cubic foot on the actual measurement of the building." Again, Mr. Taylor, replying to another question, observes the first design is a complete structure; the other one, to which very considerable additions are proposed, and where alterations and new buildings are combined, the cost per foot cube would be higher than in the case of building on a site entirely cleared, where the contractor could proceed from the foundation upwards without hindrance. With repect to buildings erected in the Northumberland-avenue, Mr. Isaacs stated that the buildings there have cost as much as from 1s. 4d. to 1s. 6d. per foot cube. But there is no comparison between a large block of offices and an elaborately fitted-up hotel. The one is comparatively simple to the other, the decoration to the hotels in the avenue would alone increase the cost per foot. The evidence upon the relation of size or dimensions to cubing rates is of interest. It is certainly a difficult point. Mr. Taylor, in his evidence, remarks: "I think the probabilities are that the cubing of a building 100ft. high would be higher than that of a building 50ft. high. It altogether must depend upon whether the larger building and the higher building has rooms of nearly the same size as the smaller building. No doubt the higher building would require thicker walls; but immediately you get away from comparatively small rooms into very large cubic spaces, then the difference in price is not great." In a fewer words we may say that the cost per foot cube of a building depends mainly upon the divisional internal walls and floors; the more numerous the rooms into which the space is divided the greater the cost. Height is certainly a factor of cost, as a high building requires thicker walls; scaffolding and labour become expensive. But if we take two buildings, one twice the superficial area of the other, but of the same height, the difference per foot would entirely depend on the interior divisions and elaboration of plan. But to say that the cubing of a bigger and higher building is *pro rata* higher than for a smaller and lower one is a proposition that does not always hold. It is so only when the rooms are about the same dimensions in both cases. It would, for instance, be absurd to cube a large public hall with the usual rooms at a higher ratio than a small villa residence because it was larger or higher. In plain English, the greater the internal space and vacuities the less charge must be placed on the cube foot.

With regard to ornamental façades of wrought stone, a considerable addition per foot must be made upon the cost of a plain brick front. To cube both at the same figure would be wrong. The evidence in the report, for instance, goes to show that a considerable saving in cost would be effected in the carrying out of the first design for the Admiralty if the towers were cut off and the engaged and separate columns of the façades were dispensed with, though at a material sacrifice of architectural character and dignity. A plain gauged brick front with stone dressings like that of the old building is estimated to cost about 2s. 6d. per foot superficial, though the difference between such a facing and the stone front would make a difference per foot cube of only 1d. The Home and Foreign Offices cost, it is stated, 1s. and one-twelfth of a penny per foot cube, or practically a shilling a foot. Other rates are given that are of value. The General Post Office new building cost 8½d. per foot, the Bow-street Police Court 11d., the Marylebone Police Court 9d., all by Mr. Taylor; St. Thomas's Hospital cost 9d.; the Royal Exchange is said to have cost 11d. The Houses of Parliament cost as much as 2s. 6d. per foot cube, the British Museum 1s. 6d., and the recent additions under Mr. Taylor 10d.; the 8d. in addition to the original cost of the latter is made up for by the expensive colonnade. Those who know these public buildings will see how materially the cubic space tends to reduce the unit of cost per foot cube.

In speaking of estimating by the cubing system, it must not be understood that we really think it prudent to calculate the cost of buildings in this way, but only for the sake of comparison, and as a very useful and often safely approximate guide. Government architects and surveyors have generally adopted the system, and in the departments of the public service there are excellent opportunities for making comparisons and tabulating results. Sir William Harcourt in his questioning was too sceptical to believe that such a system could be depended on, and asked whether any builder in the world would take a contract upon an estimate founded upon cubing. We may answer that half the estimates now made by architects and surveyors in their private and public capacities are made by cubing, and that contractors are to be found who would willingly take the risk of carrying out work in that manner. The two most perilous rocks upon which the cuber comes to grief are those of taking a figure without the verification of experience, and not making any allowance for internal elaboration of plan and decoration.

IRON DOORS FOR WAREHOUSES.



WITH the advent of large warehouses some forty years since came the natural anxiety about fire, and therefore fireproof buildings, as they were called, were designed. Assuming that a building may be made to resist attacks of fire externally, it is necessary so to arrange the internal construction that a fire in one part shall not extend beyond the limits of the room in which it occurs, and for this purpose iron doors were introduced. In this article it is not our intention to enter generally into the question of fireproof buildings, but to confine our observations to the doors used to prevent the spread of conflagration.

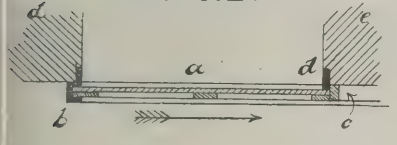
At the period to which we have alluded, there was a curious idea that iron was a fireproof material, and therefore that by its use fires, even in the largest buildings, might be localised; about the first proof to the contrary occurred in the great fire at Cotton's Wharf, Tooley-street, London. This fire is in many respects worth studying; it was discovered about five p.m. on a Saturday afternoon, and was supposed to originate by some jute or flax becoming ignited by the solar rays concentrated by a lenticular fault in the glass of the windows; the iron doors did *not* limit the fire—they softened, and the whole premises were enveloped in flames, the heat being so intense that engines had to play upon the Custom House on the opposite side of the Thames, and it was at one time feared that the stones of London Bridge would crack from the intense heat given off by burning tallow, &c., that flowed in torrents on the river. That fire lasted for a month. A *really* fireproof door would have saved the catastrophe, and this instance must stir us to the consideration of the possibility of making a fireproof door, and how to carry out successfully our ideas.

In the first place, a description of these doors as usually constructed will be appropriate, with critical remarks upon their utility or otherwise. Of these doors there are two classes: those which slide, and those which swing upon hinges. We shall first deal with the sliding doors.

The simplest form of this class is shown in Fig. 1; the doorway or opening through the wall which divides one department from another, is indicated by the dotted lines *a b*, *b c*, *c d*, *d e*. This opening is overlapped by the door on each side and at the top, by three or four inches, and at the bottom it runs in a groove *e f*, generally formed by sinking a channel-iron in the floor. These doors are

Fig 1

used in pairs, one on each side of the opening. Each door consists of an iron plate usually ¼in. thick (which for a door 6ft. high and 4ft. wide is quite insufficient), being the minimum set forth under the Building Acts, which is stiffened by stiles *k k*, and rails *l, l, l*, and intermediate stiles *m, m*; this stiffening is really very slight, as the rails and stiles *only meet*; they are in no way connected one with another, and, in fact, the construction is *copied from the look of a wooden door*. Straps are attached to the stiles *k k*, to which are fitted grooved runners *i i*, working on a runner-bar *g h*, which is dowelled into the wall above the opening of the doorway. The stiles and rails are usually made about ⅜in. thick, and riveted flush to the plates so as to show a smooth surface. The edges of the doorways are generally protected by angle-iron frames sunk into them, and against these frames the doors *are supposed to fit*. We will now consider the effect of these doors in case of fire.



In the first place, the doors cannot fit closely to the angle irons, for there must be a certain amount of play allowed in the channel iron guide in which the bottom of the door runs, and, even if this were not necessary, brickwork is not executed in such a way as to allow an hermetic fit between the door and walls. We will assume the wall to be 18in. thick, and the doorways 7ft. high by 5ft. wide, and constructed as just described—it, of course, being assumed that the *floors are fireproof*, for if they are not, the fireproof doors could not limit the spread of the flames, which will naturally attack the ceilings more fiercely than the walls.

If the material stored in the room protected by these doors is not highly combustible and capable of generating intense heat, but of a smouldering character, they will afford a sufficient safeguard, and are therefore, suitable for warehouses in which are stored such merchandise as paper and heavy cloth goods, and other similar materials; but if the goods are of a light, easily inflammable character, the heat will be generated so rapidly as to cause twisting and buckling of such said doors, when there will be apertures through which the flames may pass, or the intensity of heat may be such as to melt the cast-iron wheels supporting the doors on the runner rails, when the doors

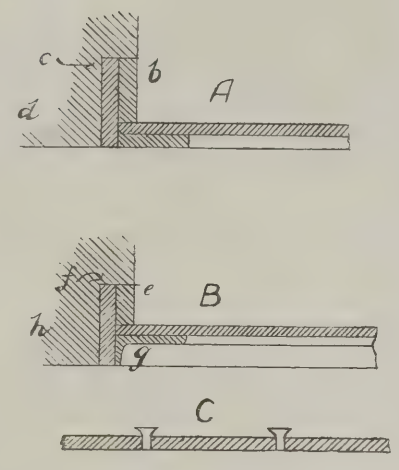
emselves will fall down, and a clear pas-ge be left for the flames. Considering this, is safer to place the wheels at the bottom the doors instead of the top, as the heat ll there be much less ; but in such case the me of the door must be made much stiffer, it is standing up instead of hanging, and sufficiently heated to become soft would ible or bend, and fall out of the top ove, so that perhaps the best way would to have the wheels on the top of the door, t make them of wrought iron, which l bear a much higher temperature without lting than cast iron.

A similar, but much better, class of door is o in use. It is shown in horizontal tion in Fig. 2, as it appears when closed.

Fig. 2.

s the door, which runs in grooves both and bottom, being supported by wheels before, but the top groove having its tal thickened laterally so as to join the ll above the door. In closing the door, *a* s into a vertical iron groove, secured to side *d* of the doorway, and at the back door has a lip, *c*, which shuts against a tical bar *d* fixed to the brickwork on the e *e* of the doorway. In opening the door s moved in the direction of the arrow.

This is a very great improvement upon the mer, and approaches in character more rly to a flame-tight valve, and further the r being framed (when closed) on three s in grooves, it is better adapted to resist kling by heat.



t is almost superfluous to observe that ler no circumstances should there be wood-k *between the iron doors in contact with* the n work, for in such case, the iron work oming highly heated, the wood-work ld be ignited by contact. Yet even in se doors there are interstices through which an pass, for there must be some amount of y between the door edges and the grooves, such work is not generally planed. planing out the grooves taper and ning the edges of the doors to fit, they ld easily be so set as to jam on being ed, and thus a practically air-tight valve uld be formed, and if there were no other t the fire would die out for want of air to l it, and the only damage would be that e by the fire itself ; whereas under other umstances the damage done by water used xtinguish a fire is very great, and fire e cannot be used without large inlets, ng unlimited supplies of air.

We will now turn to the second class of rs—hinged or swinging doors. Doors of class are made of the same thickness as foregoing, but swing on hinges formed ully like those of an ordinary iron-safe , though when the doorway has a ed head, hinges similar to those used common house doors are employed. loor of this description naturally affords ter facilities for rendering it air-tight those dealt with above ; but there is the same lack of resistance to buckling occurs in the sliding form, for the stiles rails are arranged in the same way ; the ing which should carry the plates of the s is really carried by them.

eferring for a moment to Fig. 1, if the tends to draw the plate inward, there thing whatever to prevent the apparent s (which are really only surfaces of con- between the stiles and rails from ing ; thus the centre rail *l* would be n forward without any resistance what-from the stiles *m m*, and this being the side of the door exposed to the fire (the flat side being towards the doorway opposite the corresponding door on the other side of the doorway), it would be first heated, and therefore the buckling would be in this forward direction.

In Fig. 3, A shows in horizontal section the edge of an ordinary swing door, closed

Fig. 3

against the vertical bars *b* and *c* fixed to the brickwork *d* at the side of the doorway. Taking the total thickness of door and style as ⅞in., very little buckling by heat would be required to render such closing ineffectual.

A better arrangement is shown in the door B, where the vertical stile is formed of an angle iron, *g*, closing against the bars *e* and *f* fixed to the wall *h*. Here we have the whole width of one limb of the angle iron *g* pressing against the bar *f*, and by splaying this angle iron as shown, the fit will be more air-tight, and if such a frame be carried round the four sides of the door, great resistance to buckling will be afforded.

No doubt the objection will be urged that doors thus made would be more expensive than those in use, and it is a fact they would be ; but the question that should present itself to the practical mind is : If we must put up iron doors nominally fireproof, whether it is not worth while to make them really so—whether, in fact, it is, financially speaking, more advantageous to render merchandise *absolutely secure from spread of fire*, or to do no more than the Building Acts insist upon.

The door should be thus made : the frame made of light, say 2in. by 2in. by ⅞in., angle irons welded at the corners, the rails and intermediate stiles being of the same material welded at all joints so as to form a solid frame capable of *standing alone* ; to this the panel plates are to be riveted, being studded over the surface with studs of the form shown at C (Fig. 3) to afford a key or hold for about 1½in. thickness of fireproof cement. Such a door would be absolutely safe, as it would bear many hours' exposure to intense heat before the iron itself was affected by the temperature.

The objection to swing doors in warehouses is that they occupy too much room, and for that reason sliding doors, which are easily stowed away, are adopted. The sliding doors may also be made with frames similar to those just described, but allowing the panel plates to project sufficiently to run in the horizontal grooves and into the end vertical groove, the face of the door and all exposed ironwork, except the wheels and runner bars, being coated with fireproof, non-conducting composition. Such compositions have been tested, and 2in. thickness upon a cast-iron column is sufficient to resist the fire and keep it cool for something like eight or ten hours. By "cool" we mean that when the cement was broken off the iron was not unpleasantly warm to the hand. In regard to the cost of such doors, it will be seen that by a slight alteration in the construction of the outside framing, the door can be cemented on both sides, so that one door will serve where now two doors are used.

THE CHURCH AND HALL OF DINTON, BUCKS.

By Frederick George Lee, D.D., F.S.A.

DONYNGTON, Dynton, Donitone, Danintone—for such are some of the old modes of spelling the name of this place in ancient deeds and documents—lies midway between Thame in Oxfordshire, and Aylesbury, in the county of Bucks.

The parish church and hall, a picturesque mansion-house, stand a short distance from the high road to the south, surrounded by stately elms, noble horse-chestnut trees, and ancient oaks. Both church and mansion-house are of singular interest ; and, though neither are of any great or unusual pretensions, each is worthy of more detailed consideration than—with the exception of certain notices in local publications—it has as yet received. Hence this brief paper.

The Manor of Danitone (as it is termed), and also that of Waderuge (now Wallridge), were at the period of the Norman survey possessed by William the Conqueror's brother, the Lord Odo, Bishop of Baieux. They had previously belonged to one Aveline, a noble or knight mentioned as living in the reign of King Edward the Confessor.

At the survey in question, Helto, a native Saxon, appears to have been the tenant of these manors, which, with other considerable possessions, contained a mill, valued at four shillings ; and also seem to have comprised the reputed manors of West Dynton or West Lyngton* and Forde, names still in use down to the present time ; though the local manorial rights and customs—real or supposed—are in abeyance, or lost.

"Dun" or "Doning" is said by those who have studied the subject to mean a hill or circular slope, fortified by inclosed stakes or hurdle fences ; "Tun" or "ton" a settlement of several families, a village, or town. In 1858, on a slight eminence north of the church, the late Mr. J. Akerman, Secretary of the Society of Antiquaries, found buried several skeletons and undoubted Anglo-Saxon remains, including a glass vessel and bronze spear-head.

The adjoining Manor of Opeton, now Upton, had belonged to Earl Harold. It was, and is, a mere small hamlet. It contained eighteen hides, had a mill valued at four shillings, a fishery for a thousand eels, and pannage for two hundred hogs. It was anciently divided into Upper and Lower Upton—a division not now existing. One portion, at the Norman survey, was held by William Peverill, the other by Miles Crispin. There appear to have been at least three other manors in the parish—Aston Moleyns, Blomere, and Moreton or Moretown. Various ancient and renowned families held these at different periods, and it can be proved that the chief manor of Dinton has belonged in turn, descending one to the other, to the following races :—Warine de Monchensi, William de Valence, John, Lord Grey, Sire John Devereux, Walter Fitzwalter, Thomas Whittingham, Sir William Warham, John Montgomery, Sir John Darrell of Lillingstone Darrell, Edmund Verney, John Mayne,† John Vanhattem, and at the present time to the family of Goodall.

The other manors, or reputed manors here belonged, at different periods, to the families of

* The House of Westlington, for some years the chief residence of the family of Francklin—members of which were High Sheriffs of Bucks in 1729 and 1803 respectively—is now the property and residence of Henry Bode, Esq., J.P., who married the senior co-heiress of the late Mr. John Francklin.

† Amongst my "Bucks MS. Collections" I have a note that the first Mayne was apparently a London scrivener and money-lender, who took as security for money lent the mansion-house of Dinton Hall, then called "Verney's Place," from John, Edmund, and Robert Verney, in the 17th year of Queen Elizabeth.

Dover, Ingoldsby,* Greenaway, Lee of Moreton,† Verney, Pye, Beke or Beck, Francklin, Serjeant, Sumner or Somner, and Saunders.

Dinton Hall stands on the immediate south side of the parish church, surrounded by high brick walls to the west and north, and with a remarkably open and beautiful view of the Chiltern Hills, stretching from Wendover to Stokenchurch, to the south. The gardens and wilderness adjoining the Hall are notable as containing a remarkably fine collection of choice and out-of-the-way shrubs and flowers, making it a place of great interest to the botanist. Beyond this, again, are fish-ponds in low-lying meads, and much picturesque timber here and there. The view from this southern aspect of the Hall looks out over the two Kymbles, Hampden, and Checquer's Court in the distance, with the lovely scenery of the adjacent Velvet Lawn, one of the most beautiful spots in the whole of Buckinghamshire, and towards the long range of the Chiltern Hills.

The house itself, which has been very much altered from time to time, is of considerable antiquity. Possibly parts of it, the underground western cellars, may have belonged to a Norman mansion. Colonel Goodall, its present owner, believes that a rectangular stone construction of a singular and not very definite character—the use of which, too, is not very apparent—may be of the time of Edward the Confessor. I myself having inspected it, am unable and unwilling to express any opinion on the point. The late Mr. Street, R.A., judging from fragments of stone mouldings, believed that the northern part of the house—that over which its nine gables now stand—was, in part, of as early a date as the year 1475. The main portion of the mansion was no doubt erected on old foundations in the reign of King Henry VII., and this seems to have been again altered *tempore* James I., some of the older fittings being evidently of that period. In the eighteenth century the old windows of the southern front with stone mullions picturesquely cusped were removed, and plain, narrow sash windows inserted and painted white, which effectively destroyed the finest features of this portion of the building, containing the Hall itself. Other portions were pulled down or seriously disfigured. The current taste of the middle of the last century unfortunately was not conducive to the preservation of old English houses of a Tudor or Jacobean character. About thirty years ago, however, the whole of the mansion was thoroughly restored, with general good taste and with due regard to what remained of its antiquarian and archæological characteristics.

Simon Mayne, whose father, as already stated, appears to have purchased the Manor from the Buckinghamshire race of Verney, resided here in the latter years of Queen Elizabeth's time and in the earlier period of James the 1st's reign, but died 13 July, 1617. His eldest son, born in 1612, bearing the same name, succeeded him in the estate. The former is said to have suffered much from the forced loans of Elizabeth's later years, and to have thus become somewhat impoverished; so that when the heir, a minor, succeeded his father, his patrimony was found to be burdened with heavy mortgages and other charges. In this particular the lot of the Verneys had become in turn the lot of the Maynes, a distinctly "Reformation race." Hence, during the Civil War, the second Simon Mayne was most active on the Parliamentary side of the strife. Being M.P. for Aylesbury, and a man without undue scruple or sensitive conscience, he was appointed one of King Charles I.'s judges, and subsequently affixed both signature and seal to the vellum warrant of execution. During the Commonwealth, he continued to be one of the "Parliamentary committee-men" for Bucks; but, at the Restoration, was brought to trial with other of the chief regicides, found guilty, and had sentence of death duly passed upon him. In the Pardon of Charles II., Mayne was exempted by name, and died in the Tower of London (where, since his sentence, he had been confined), in April, 1661, aged 49. He was buried in Dinton Church.

A man named John Bigg, belonging to a family of gentle-people, clerk and secretary to the second Simon Mayne, is believed by some to have been the actual executioner of King Charles I. The whole of the evidence on this subject, when combined, seems slight.

Thomas Hearne, the antiquary, of St. Edmund Hall (A.D. 1713), describes him thus:—

"He liv'd at Dinton, in a cave underground; had been a man of tolerable wealth; was look'd upon as a pretty good scholar, and of no contemptible parts. Upon the Restoration he grew melancholy, betook himself to a recluse life, made all other cloths in the same manner as his shoe, lived by begging, but never asked for anything but leather (which he would immediately nail to his clothes), yet kept three bottles that hung to his girdle—viz., one for strong beer, another for small beer, and a third for milk; which liquers used to be given, and sometimes brought to him, as was his other sustenance, notwithstanding he never asked for them.

"I have heard several accounts of this man from those who well knew him. Some person in the neighbourhood of Dinton have his picture drawn.* He put off all his clothes at once, they being all fastened together, and so in like manner put them on."

He was born 22nd April, 1629, and buried at Dinton, 4th April, 1696.

The manor and mansion were purchased from another Simon Mayne, a poverty-stricken son of the Regicide, in the year 1727, by John Vanhattem, whose ancestor, Leibert Vanhattem, of Holland,† had been a naval officer in the fleet of Admiral de Ruyter,‡ and came over from that country with William, the husband of Princess Mary Stuart. This John, who died in 1747, left an only son and heir, and two daughters. The son in question served as High Sheriff of Bucks in 1760, and was knighted by George III. in 1761. He died in 1787, and a daughter married the Rev. William Goodall, of Berkhampstead, brother of a courtly and celebrated Provost of Eton, who came out of the county of Norfolk. Their eldest surviving son, the Rev. John Joseph Goodall, M.A., Pemb. Coll., Oxon, was the father of the present possessor, Lieutenant Colonel Goodall, who married a niece of the late Dr. Lee, Q.C., of Hartwell Park, and granddaughter of Sir Percival Hart-Dyke, of Kent, Bart.

The mansion-house, 154ft. in length, is extremely picturesque, and its interior at once stately and comfortable, the old architects having ever studied the comfort of those who employed them, and having given thought to their plans. Its collection of choice china and various curiosities, including a sword of Oliver Cromwell, a shoe of John Bigg (the other being in the Bodleian Library), antique furniture, tapestry, carvings in wood, stained glass, fossils, embroidery, are of considerable interest. An "Album," first commenced by the Rev. William Goodall, grandfather of the present Lord of the Manor, is full of subjects of interest, local records, drawings, and autographs. The old hiding-place, near the chief eastern block of chimneys, opened when the house was restored, has been closed up. It was no doubt built as a place of personal security, and was entered by a trap door through the movable steps of a staircase. The chief rooms, including greater and lesser hall, dining-room, chief drawing-room, library, morning room, and others are of good proportions, and contain everywhere several objects of art and interest.

For the following account of the pictures I am indebted to another hand. My recent examination of them was too brief and superficial to enable me to pass a judgment upon them. That which follows ought to be accurate and sound:—

"There is a collection of some two hundred pictures at Dinton Hall, mostly by Dutch artists, the greater part of them having been brought over from Holland by the ancestors of Sir John Vanhattem, whose only daughter and heiress married the grandfather of Lieut.-Colonel Goodall, the present owner. Amongst the finest are the following: 'The Infant Moses trampling on the Crown of Pharaoh,' by Rembrandt; 'Vandyck,' with a sunflower in his right hand, showing a chain with his left, by himself; 'A Storm at Sea, with Wrecks,' by W. Vandervelde; 'Teniers' Villa,' by David Teniers; 'Adam and Eve in the Garden of Eden,' by Breughel; 'A Hawking Scene,' by Wouverman; 'St. Francis at his Devotions,' by Gerard Dow; 'Diogenes in the Market-place of Athens Searching for an Honest Man,' 'Jans Victor, 1654.' Landscapes by Hobbema, Salvator Rosa, and Ruysdael. 'A Man Playing a Violin,' by Terburg; "Head of Melancthon," by Holbein; 'St. Cecilia,' with the heads of her husband and brother being shown to her in a large dish, by Domenichino. Portraits of Oliver Cromwell, Cornet Joyce, and Thurloe, by Walker; of Admiral and Madame de Ruyter, by Nason; William III. and Queen Mary, by Sir P. Lely; and several other portraits by Vandyck, Sir Peter Lely, and Sir Godfrey Kneller. Flower pieces by Baptiste, and battle pieces by Vandermeulen. Many of the pictures are on copper and panels. Arms in painted windows: England and France, William Warham, Archbishop of Canterbury, Sir James Darrell, and several others that I do not know."

The church and advowson of St. Peter's, Dinton, had been bestowed upon the convent of Godston, Oxon, by Agnes de Monchensi under Henry I., and this donation was confirmed* by a charter of Richard II. (see "Monasticon Ang.," tom. iv. 364). Subsequently, a vicar was appointed to serve the church, the great tithes remaining with the convent, and he himself receiving ten marks *per annum* and certain lesser tithes from Moreton, Aston Moleyns, and Waldridge.

The ancient family of Doyley, of Chiselhampton, Oxon, obtained the patronage of the vicarage about the year 1547, it being conveyed to two brothers of that name, John and Robert (Patent Roll of Edward VI. No. 29). Subsequently, it passed to the family of Serjeant, of Waldridge Manor, in Dinton, none of the members of which are buried in the church. The Crown, however, appears to have reserved or obtained the right of presentation, for Queen Mary nominated a vicar in 1553, possibly by lapse. It afterwards passed to the Maynes by purchase, and when Simon Mayne, the Regicide, was exempted from the king's pardon, the vicarage again lapsed to the Crown. The Lord Chancellor is its present patron.

The church itself, dedicated to God in honour of St. Peter, is a building of more than average interest. It consists of nave, chancel with south aisle and south chapel, a bold square tower standing at the west end, having a stair turret at the north-east angle. There is a south porch of some antiquity, with stone sediles on either side, and a specially remarkable, highly-sculptured Norman doorway leading into the church. An excellent copper-plate of this is in existence, drawn by Brett and engraved by Basire; and a somewhat feeble wood-cut by Whittock.

The base of the much-worn churchyard cross, to the south of the porch, is evidently of great antiquity; but no sufficient indication of its exact age are now apparent, the mouldings and chamfers being obliterated or destroyed

* Richard Ingoldsby (temp. Henry VIII.), son of another Richard, married Winefred, daughter of John Greenaway, of Leckhampstead and Dinton (Noble's "Memorials of the Regicides," Vol. II. p. 211). His great-great grandson was created a baronet Aug. 30, 1660. This is presumed to have become extinct. But the surmise is doubtful.

† The Lees of Hartwell are presumed to be descendants of the Lees of Moreton, one of whom, Ralphe, subsequently settled at Saunderton in Bucks. A grant of arms, "Coate and Crest," was made to Ralph Lee, of Saunderton, gent., who was also of the City of London, in the reign of Queen Elizabeth, A.D. 1572. The Lees of Moreton had not borne arms. Harl. MSS. 808.

* There is said to have been, I may add here, an original oil painting of him at Winchendon Priory, about three miles from Dinton, the seat of Sir Scrope Bernard Moreland, but the pictures at this house having been dispersed early in the present century, it is apparently lost. See, for other information concerning him, Thomas Hearne's letter to Browne Willis, dated "Oxon, 12 Feb., 1712-13," in the Bodleian Library, *sub anno* 1713.

† There is a contemporary portrait in oil, side-faced, of this gentleman preserved here.

‡ In the noble church of St. Lawrence Alkmaar, in North Holland, a fine specimen of 15th-century Gothic though cleared out of most of its old fittings and *ornamenta*, there remains suspended a remarkably good model of the ship in which Admiral de Ruyter's greatest naval victories were secured. His portrait, as a national benefactor, was anciently hung in the vestry of this church, but has been removed to the public portrait gallery. A curious and rare volume, which in the case of my own copy has a good copper-plate portrait "The Life of Michael Adrian de Ruyter, Admiral of Holland," 18mo., London: Printed for I. B. for Dorman Newman, at the King's Arms, in the Poultrey, 1677, gives a plain and readable account of a very distinguished sailor, one who had risen from a comparatively humble position to become a successful admiral, respected and regarded with admiration by all his grateful fellow-countrymen.

* See "Record of Bucks," Vol. III. p. 93.

he nave is 63ft. 6in. in length, and the h aisle is almost the same. The width of e and aisle combined is exactly 41ft. sured within the walls. The chancel is t. long by 16ft. wide, the lower walls of latter being of remarkable thickness and lity. The level of the churchyard is much re the floor of the church.

he south porch is Norman. The chancel, xcellent proportions, is in the First Pointed e, with small well-splayed lancet windows either side, and a window of three-light ets at the east end. The chapel at the east of the south aisle is of Second Pointed k; while the bases of the pillars of the appear to be of the same period, but the and much-worn mouldings have been in s materially altered. The south windows also in the same style. The northern win- s of the nave, of two and three lights ectively, are of the Third Pointed Style, very poor. In 1843 they contained in their ls several interesting fragments of stained s—angels with musical instruments or ing the *signa* of the Passion, the arms of See of Canterbury, the arms of Ingoldsby inton, and numerous very curious Tudor ered quarries.

the east wall of the chancel there was ntly an aumbrye or tabernacle of stone he Sacrament in the centre, immediately id the high altar, which appears to have t about 2½ft. away from it*), another rye in the north wall of the sanctuary for cred oils and vessels for the Eucharist, a credence and piscina, one above the ; under a single-pointed arch in the t wall, immediately to the east of tone *sedilia* for the sacred ministrants. v fragments of very Early glass remained e southern lancet windows, some of which red to represent the "Coronation of the n," so recently as 1843. The type of glass he same as that in the south transept of In Cathedral. In the south aisle an lic shield, barry of six, Argent, and Or, kings' heads crowned within a garter. ulpit, which, until the recent restoration church, had been placed over and above inister's and clerk's pews, against the of the nave, facing south, now stands on l-designed stone basement at the south f the chancel-arch, facing west. The s and clerk's pews have been abolished. ont, carved in local stone, circular in † is of large dimensions, and stands near uth porch. It is of Early English or Pointed work, with quatrefoils round its portion, the lowest part being wrought rved grooves. The Communion-plate s of an Elizabethan silver cup and cover r design; a silver dish and two large and me eighteenth-century flagons for wine ter. These latter were given in 1772 by n Vanhattem, Knt. The salver had been usly presented by Thomas Ingoldsby in

e is some modern glass in the chancel onnor, representing a series of Scriptural nd persons, rather confusing than illus- . It requires a small treatise to describe plain it. Too much has been obviously ted in a small space; while the deep —the dark reds, blues, and crimsons— nore light glass as a due and proper Below is represented the Incarnation, s in the Manger; while above this is a , with Mary and John; and over this, Our Lord in glory. But it wants the ity, breadth, and effect of the old glass- s and their art.

lancet windows of the chancel contain of saints—on the north side, SS. Eliza- ohn the Baptist, Anna, and the B. V. on the south, SS. Katharine, Euphemia, nes. These, of no particular merit, ven by Mrs. Acton Tindal, a writer of one of the daughters of a previous ie Rev. John Harrison. These likewise O'Connor.

races of the old platform of three steps have ved. Everything here, including the floor level, he old Communion-table, dated 1606, is now in , and is used as a vestry-table, a new Commu- redos, costly, appropriate, and effective, and l is in excellent order.

f the same type as the fonts of Ellesborough, Haddenham, Crendon, Cuddington, and Monk's h—all in the County of Bucks.

A window by Hardman—containing figures of Faith, Hope, and Charity—is good, though the subjects—abstract graces—are difficult of representation and ineffective. It would have been better to have had figures of saints, in whose earthly lives faith, hope, and charity were eminently remarkable.

That by O'Connor to members of the Raper family, at the east end of the south aisle, is glaring and gorgeous, but vulgar.

There remain in chancel, nave, and tower, monuments, some of them of great antiquarian interest, to the following. But several of these were removed and misplaced when the late Mr. G. E. Street restored the church, and took greater liberties with memorials of the dead than seems justifiable. The clergymen and churchwardens being the legal custodians of such (for the privilege of erecting which people in bygone times obtained legal faculties and paid heavy fees), should have refused permission for such needless change and destruction to have been carried out.

1. Simon Mayne, Esq., died 13 July, 1617.
2. Mistress Mayne (Coluberry Lovelace, daughter of Richard Lovelace, of Hurley, co. Bucks, brother of Lord Lovelace), died 10 Jan., 1628.
3. Francis Lee, of Moreton, died 23 Aug., 1508.
4. John Lee, of Moreton, died 6 March, 1505.
5. William Lee, of Moreton, died 9 Oct., 1486.
6. John Vanhattem, Lord of Dinton, died 7 Jan., 1747.
7. Colonel Richard Beke, died 29 Nov. (year obliterated).
8. Elizabeth, his wife (daughter of Sir Thomas Lee, of Hartwell Park), died 30 May (year obliterated).
9. Richard Serjeant, Esq., died 28 Aug., 1668.
10. Anne, his first wife, daughter of Sir Richard Ingoldsby.
11. Jane, his second wife, daughter of Sir Edward Harrington, died 5 May, 1681.
12. Richard Ingoldsby, Esq., died 14 April, 1703.
13. Richard Greenaway, Esq., died 30 Jany., 1551.
14. Joane, his wife, daughter and heiress of John Tylney, of Leckhampstead.
15. Dame Elinor Lee, wife of Sir Thomas Lee of Morton, died 6 April, 1633.
16. William Griffin, of Morton, died 10 May, 1781.
17. Elizabeth, his wife, died 11 Dec., 1776.
18. Sir John Vanhattem, Knt., died 4 Dec., 1787.
19. Thomas Greenaway, Esq., died 26 April, 1538.
20. Elizabeth Greenaway, Esq., died 23 May, 1539.
21. John Kingsley, died 28 Dec., 1719.
22. Anne Ingoldsby, daughter of John Limbrey, of Tangier Park, Hants, died 21 May, 1741.

In concusion, it may be confidently put on record that the state of the fabric generally is excellent. As in so many other parishes, however, the earth round the foundations of the church is constantly being added to by burials —one of the chief reasons for the internal dampness of these buildings. It would be well if every village owned so carefully-restored a sacred edifice as Dinton Church.

BUILDING MATERIALS.—IV.*

By W. Y. Dent, F.C.S., F.I.C.

In my last lecture I directed your attention to cements, some of which derive their binding properties from the formation of hydrated compounds of silica, alumina, and lime, and others from simple hydration, or combination with water only. There is, however, another cementing material in very common use, which is of an altogether different character, upon which I have a few remarks to make, commonly known as asphalte, its value depending upon the binding properties of bitumen. Under the general term of bituminous substances are included a variety of inflammable materials found in nature, such as pitch, tar, asphaltum, naphtha, petroleum, differing from each other in consistency, and in various other respects, but all possessing a peculiar and characteristic odour; of these, naphtha is the most fluid, and asphalte the most compact and solid. The largest deposits of this character are those of the Dead Sea and the lake of Trinidad; this tar lake is more than a mile and a-half in circumference, and of unknown depth; the bitumen near the shore is solid, but decreases in consistency as it approaches the centre, where the temperature is higher. Extensive bituminous deposits are also found in Auvergne and other places in France, at Seyssel, near the Rhone, and elsewhere. The petroleum wells in America and Russia have probably had the same origin as bitumen. These bituminous deposits are supposed to have resulted from the action of heat and moisture on vegetable substances under pressure, the products of such action, which under ordinary circumstances would have been evolved as gas, having been compressed into a liquid or solid form. When bitumen is mixed with chalk, it forms a compact semi-elastic solid, which is not affected by alternations of temperature nor reduced to powder by attrition, and such a material is, on account of its plasticity and tenacity, as well as from its being impervious to water, particularly suitable for floors, pavements, and other purposes where it is liable to be exposed to a great amount of friction. No artificial mixture of bitumen and calcareous matter is so well adapted for the manufacture of the description of asphalte used for road-making purposes as the natural deposits found at Val de Travers and at Seyssel, its superiority being possibly due to the very perfect manner in which the carbonate of lime is incorporated with the bitumen, owing to the enormous pressure under which these deposits have probably been produced. The native asphalte rock consists for the most part of carbonate of lime, more or less impregnated with bitumen, the quantity of which varies from about 6 to 12 per cent.—that from Val de Travers, in the canton of Neuchatel, containing rather more bitumen than the Seyssel. The prepared asphalte, as sold by the makers, is termed "mastic," for the manufacture of which the asphalte rock is crushed under a steam hammer, and ground to powder by edge runners. The powdered rock is then carried forward by means of an endless screw to cast-iron vessels placed over a fire, in which it is mixed with suitable proportions of fine sand and bitumen, and kept constantly stirred for from two to three hours, when it is run out into blocks of 120lb. in weight. When the mastic is used it is re-heated with more bitumen, in order to render it sufficiently fluid, more or less coarse sand being mixed with it according to the purpose to which it is going to be applied. Coal-tar pitch is sometimes used instead of mineral bitumen, but this deteriorates the quality of the asphalte, coal-tar pitch being a hard brittle substance which does not possess the toughness of mineral bitumen; it softens readily when exposed to heat, and pavements made with such asphalte are liable to become soft and adhesive under the influence of a hot sun. Good asphalte should withstand a temperature of from 140deg. to 160deg. Fahr. without being affected to any appreciable extent, and should not become so fluid as to run down below a temperature of 260deg. Fahr.

PRESERVATION OF WOOD.

The best means of preserving timber from decay, and enabling it to resist for the longest possible period those changes that are included under the term eremacausis—which may be regarded as a species of slow combustion of the constituents of the wood with the oxygen of the atmosphere—is a subject that has for many years occupied the attention of chemists and engineers. Wood consists of a mass of cells or fibres, the newer portions of which are filled with the particular kind of sap appertaining to each special description, which, when the life of the plant ceases, can no longer resist the influence of the surrounding air and moisture, but begins to be subjected to a process of oxidation as the air gains access to the juices of the sap through the tissues of the wood. These juices consequently begin to ferment and decompose, the albuminous constituents, or those containing nitrogen, being the first to undergo this change, which proceeds from these to the mucilaginous, such as sugar, starch, and gum. This fermentation is assisted by the moisture contained in the wood, and is attended with the appearance of fungoid growth, when it is generally known by the term "dry rot." This dry-rot fungus possesses the property of secreting moisture, even from a moderately dry atmosphere, and hence, when once the growth of this fungus commences, it proceeds with rapidity, since it is able to procure for itself the moisture that is essentially necessary for its increase. Unseasoned wood contains within itself the elements of decay, and affords the conditions necesssry for the development of the dry-rot fungus. When such wood is placed in situations where there is not a free circulation of air, this fungoid growth soon makes its appearance, and the germs spread rapidly in every direction, the wood becoming in a comparatively short time reduced to the condition of fine dust. When wood is thoroughly

* Being the Cantor Lecture delivered before the Society of Arts.

seasoned, external moisture is necessary for the commencement of this process of decay; but perfectly dry wood shows but little tendency to alteration, as we find to be the case with the gopher wood found in Egyptian catacombs. Timber of slow growth is less liable to decay than when it arrives quickly at maturity, this being the case even in timber of the same description. It has been stated that telegraph poles made from trees grown in the comparatively rich soil of Devonshire begin to decay in a shorter time than poles made from the larches grown in the Highlands. When timber is immersed in water containing air in solution, and the air is constantly being renewed, the woody fibre will in course of time be converted into a dark brown substance, to which the name of *humus* has been given, this being one of the constituents of vegetable mould. It is well known that the decay of wood under such circumstances is rapid, as is the case in tidal waters, or in other situations in which the wood is alternately exposed to the action of air and water, as compared with wood immersed in deep water, or in still water that is not changed. The air contained in such water becomes exhausted of its oxygen, and the process of decay is arrested, or may never take place to any extent. Accordingly, it is found that piles driven in deep water, or in clay or mud, will remain sound for an almost indefinite length of time, as was exemplified in the elm piles of old London Bridge, which, when taken up, were found to be in a sound condition after the lapse of 800 years. Only a few years ago two canoes, each formed from a single log of oak, were recovered in good condition from the bottom of a loch in Aberdeenshire, where they are supposed to have been lying for 1,000 years. More recently, a boat, similar in character to these canoes, was discovered at Brigg, in Lincolnshire; and in 1881, in making excavations for steam docks at Liverpool, a portion of a ship was found which must have been embedded for at least 200 years, the elm beams of which were in a perfectly sound condition. Besides being liable to gradual decomposition by the ordinary and natural processes of decay, timber is liable to be injured by the attacks of boring worms, the most formidable of which are the *Teredo navalis* and the *Limnoria terebrans*, and also in hot climates by that very destructive insect, the white ant. The capabilities possessed by different kinds of wood of resisting these attacks vary considerably. Those descriptions which contain a large amount of resinous matter, such as the greenheart timber of Demerara, and pitch pine, *Pinus rigida*, are less liable to such attacks than much harder woods which are of a less inflammable character. The greenheart timber contains so much empyreumatic oil that it is known by the name of torchwood, on account of its burning freely like pitch pine, and there is no doubt that it is from the presence of this oil that it derives the power which it possesses of resisting these attacks to a greater extent than most other descriptions of wood. There are other woods that are reputed to have similar capabilities of resistance, of which there were a number of very fine specimens in the Colonial Exhibition. Amongst these may be mentioned the billian, a hard very dense wood, and the russak wood from North Borneo; the cypress pine from Queensland; sneezewood from the Cape of Good Hope; horseflesh mahogany from the West Indies; the karri (*Eucalyptus diversicolor*), growing sometimes to the height of 300ft., and the jarrah (*Eucalyptus marginata*), of which there was a beautifully polished specimen in the Colonial Exhibition from Western Australia. This wood was used for a portion of a jetty at Perth, on the Swan River, Western Australia, and remained perfectly sound after the lapse of thirty years. Greenheart timber was for a long time considered to be safe from the attacks of boring worms, but the experiments carried out some time ago by the Dutch Government with this as well as other descriptions of wood show that none of these woods can be thoroughly depended upon when placed in situations most favourable to the increase of these destructive agents. The extension of the railway system gave rise to the employment of an immense number of wooden sleepers, and the rapidity with which they were found to decay rendered some means of preserving them an absolute necessity, and accordingly we find that various methods have from time to time been proposed for the preservation of timber, some of which have been carried out in practice with more or less successful results. The efficacy of any such process depends upon the power of the material employed to so change the sap as to render it not susceptible of putrefaction, while it imparts to the wood such properties as will be unfavourable to fungoid growth, and will render it to a considerable extent repellent of water. The first process to receive any extensive practical application was that known as kyanising, which was the subject of patents taken out in 1832 and 1836 by Mr. Kyan, and consisted in steeping the wood in open tanks in a solution of bichloride of mercury, commonly known as corrosive sublimate. The impregnation of wood with a salt which is known to be so fatal to animal life could scarcely fail to prove effective; and this process was for many years very generally adopted. The cost was considerable, as to render the process efficient it was necessary to employ a solution containing 1lb. of the mercury salt to four gallons of water, and a load of timber was found to absorb as much as from 6lb. to 7lb. of the salt. This process has for many years been to a great extent superseded by others of a less expensive as well as more effective character, since although the use of corrosive sublimate was perfectly successful in dry situations, it did not always prove so satisfactory when the wood was subjected to the action of sea-water. Chloride of zinc is a salt which has long been known to possess considerable antiseptic properties, and in 1838 a patent was taken out by Sir Wm. Burnett for the use of this salt as a preservative of wood. In carrying out his process, he adopted the apparatus first proposed by M. Bréant in 1831. The wood was placed in closed iron cylinders into which, after exhausting the air, a solution of zinc chloride was admitted, and then forced into the pores of the wood under a pressure of 150lb. to the square inch. This process was employed on a considerable scale for many years, but it has now given place to more efficient methods, although it is still used to some extent in Germany. Some years ago a number of experiments were carried out by Dr. Boucherie, who very ingeniously availed himself of the force of the ascending sap in growing trees, by causing it to draw up various solutions. A large incision was made in the lower part of the tree, round which a trough of clay was placed, filled with the preservative solution to be tried, and this was carried up with the ascending sap. When experiments were made with felled timber, the trunk was immersed in a closed vessel which was filled from a reservoir placed at a considerable height above, so as to obtain a pressure of 30 or 40ft., and in this manner Dr. Boucherie succeeded in replacing the sap of the timber by solutions possessing properties which were likely to preserve the wood. Of the various salts experimented with, copper sulphate gave the best results. This method of applying the solution was adopted for a short time in France; it possesses the advantage of requiring no machinery, and of being capable of application upon the spot, and hence it has sometimes been found useful for newly-cut wood required for telegraph poles. The peculiar action which copper salts exert upon cellulose had long been known, and in 1837 a patent was taken out by Margary for the use of sulphate of copper as a preserving agent for timber. This salt was extensively employed for many years, the impregnation of the wood being accomplished by the use of exhaust and force pumps, and it subsequently became the process most generally adopted in France. The effect of copper salts in the preservation of vegetable fibres from decay is strikingly illustrated in the case of what is known as the Willesden canvas. Fabrics of canvas or paper can be made perfectly waterproof by the action of a solution of the copper salt employed in the Willesden process, they are free from liability to mould, are not injured by wet, and are rendered capable of resisting the attacks of vermin of every description. This canvas has been used in the most trying climates, such as Egypt and India, and was employed by Stanley in fitting out his expedition to Africa. The copper solution employed is prepared by simply dissolving hydrated oxide of copper in strong liquid ammonia. The goods to be subjected to this process are passed through a bath of this solution, at such a rate as to cause the exter portion of the fibres of the canvas or paper become pectised or gelatinised, without allowi for sufficient time for the action of the copp salt to proceed so far as to injure the streng of the material; the canvas is then passed o drums, such as are used in ordinary pap mills, and dried, whereby the film of pecti cellulose is converted into an insoluble varni The paper or canvas can be made of any quired thickness by passing two or more at same time through the bath, pressing th together, and then drying, thus producin material of sufficient strength for the purpo of light roofing. By far the most importan all the methods now employed for the pre vation of timber, and adopted almost to exclusion of all others in England, Belgi and Holland, is that known by the nam creosoting, which consists in impregnat wood with an oily liquid termed "dead oil," heavy oil of tar, obtained in the distillatio gas-tar. The efficacy of pitch, tar, and b minous substances generally, as preservat from decay, has been recognised from a v remote period, as we learn from the histor records of the Egyptians, Greeks, and Rom The Egyptians undoubtedly displayed great skill in the manner in which they ducted their processes of embalming. Bitu in one form or other, appears to have largely employed, and their success c hardly be more strikingly exhibited than i case of the heart of an Egyptian mu which, after having been preserved for 3,000 years, began to decompose upon removal of the antiseptics employed. I writings of Herodotus and Pliny we fi description given of pitch, tar, and resin from the latter celebrated writer we learn the Romans were acquainted with the fact timber was less likely to decay when continuously under water than when ex alternately to the action of air and water also that they knew something of the des tive powers of the teredo. The applicati tar distillates to the special purpose o preservation of wood was proposed as far as 1754, when a patent was taken out varnish prepared from the American pitch and for a product obtained from the distil of tar to be applied as a preventative of in wood. In 1838, and again in 1848, p were taken out by Mr. Bethell for the tar liquor. There is perhaps no pra application of chemical science to man turing operations that has yielded such sp results as have attended the investigatio the nature and composition of coal-tar. years ago no one would have ventured t mise that in what was then regarded almost valueless, dirty, and evil-smelling product obtained in the purification o would be found the source from which be produced a most splendid series of o products that would not only rival the c obtained from indigo and madder, but in cases supersede them altogether, and cre entire revolution in the whole system of d

(To be continued.)

ENDURANCE OF METALS UND STRESSES.

AT the closing meeting of the Sect Mechanical Science of the British ciation last week, the report of the com appointed for the purpose of obtaining mation with reference to the endur metals under repeated and varying stres the proper working stresses on railway and other structures subject to varyin was presented by Mr. A. T. Aitchison, th tary. The committee having considered evidence procurable up to the present ti arrived at the following conclusions:— those cases in which the dead weight i less than the live load it is the practice neers to adopt a lower working stress t tons per square inch, as permitted by th of Trade. (2) In those cases where t weight is large compared with the l the results of experiments on the fa metals indicate that a higher working permissible with the same degree of s with the lower stresses in smaller st In small bridges, where the effect of w sure is practically insignificant, the n

ress, being due to the passage of the live load, of frequent occurrence; while in larger ructures, where the wind pressure is a very nportant element in arriving at the maximum ress, it is clear, from the infrequency of heavy ind pressure, that the maximum stress but rely occurs. (3) If the working stress per- issible be arrived at from the consideration of e experiments upon the endurance of metals der repeated changes of load, then the proper lling load to assume is certainly that which ay be reasonably expected to come upon the idge a great number of times. (4) With gard to dynamic action, the shocks re- lting from bad rail points are of import- ce. Rails in 60ft. lengths are occasionally ed over bridges in order to avoid injurious ects from this cause. The Committee recom- nded (*a*) that in the case of very small rders and cross girders where the forces erating upon them are either all tensile or compressive, the maximum stress to which ought-iron should be subjected by the qui- ent weight of the moving load, added to the ight of the structure, ought not to exceed r tons per square inch. (*b*) That in the case bridges or structures of such magnitude that dead weight is more than twice that of the ving load, the stress upon wrought iron may safely increased to nearly six tons per square h. (*c*) That in those members or parts of uctures which are exposed to stresses alter- ing from tension to compression, the maxi- m tensile stress, added to the maximum mpressive stress, should not exceed four tons square inch; nor the maximum tensile ss or compressive stress, considered inde- dently, exceed four tons per square inch. In computing the strength required to st wind pressure, considering that very high ssures are of rare occurrence, the stress upon ught iron from the effects of wind may ly be taken at six tons per square inch. (*e*) teel of suitable quality a stress 30 per cent. ter be allowed.

RESISTANCE OF STONE TO CRUSH- ING, AS AFFECTED BY BEDDING.

T the recent meeting of the British Association at Manchester, Prof. W. Caw- ne Unwin, F.R.S., read a paper on "The stance of Stone to Crushing, as Affected by Material on which it is Bedded." He rved that twenty years ago it was common xperiments on crushing to bed the test imens of rigid materials like stone on lead s, with an idea of securing uniform dis- ution of pressure on the faces at which the hing pressure is applied. Prof. Unwin has held the opinion that to support blocks rushing on a plastic substance is wrong in iple. Hence in experiments on the ning of stone, and of Portland cement and rete, he has adopted the plan of preparing faces on which the crushing pressure acts a thin layer of plaster. This can easily orked to smooth and parallel surfaces, used ceive the iron plates of the crushing es directly if necessary; but the author ally interposes a sheet of millboard, h is a very hard and only slightly com- ible material. It seemed desirable to try was the difference of the crushing strength ocks supported in these two ways. Two of 4in. cubes of Portland stone and York- grit were obtained of very uniform ity. The results of the tests are given . The author was surprised at the very reduction of strength which occurred a thin plate of plastic material like lead d on the faces to which the crushing sure was applied. It would be seen that rushing pressure of blocks between lead was in one case only three-fifths, and in er only three-sevenths of that of blocks ed with plaster and crushed between ard. One block was cemented carefully en two rigid iron plates with parallel ces, and this carried a little more, but y little more, load than the block prepared plaster and crushed between loose mill- rd. An examination of the mode of ure of the blocks shows why the lead has angerous an effect on the strength. The k crushed between millboards sheared ximately at 45° in the way well under- d forming regular pyramids; but the blocks crushed between lead broke up into a number of vertical prisms with nearly vertical faces. The lead flowing under the crushing pressure produced by friction a tension in the block at right angles to the crushing pressure, tearing the block in pieces and completely altering the angle of fracture. The pressure of fluidity of lead is known to be from 1½ to 3 tons per square inch, and these pressures were exceeded in the crushing experiments.

The result seems important, because it is still a common practice to use lead, or deal, or some other plastic or compressible material in crush- ing experiments, and it is not generally known that this has the effect of diminishing the crushing resistance. The following table was appended to the paper:—

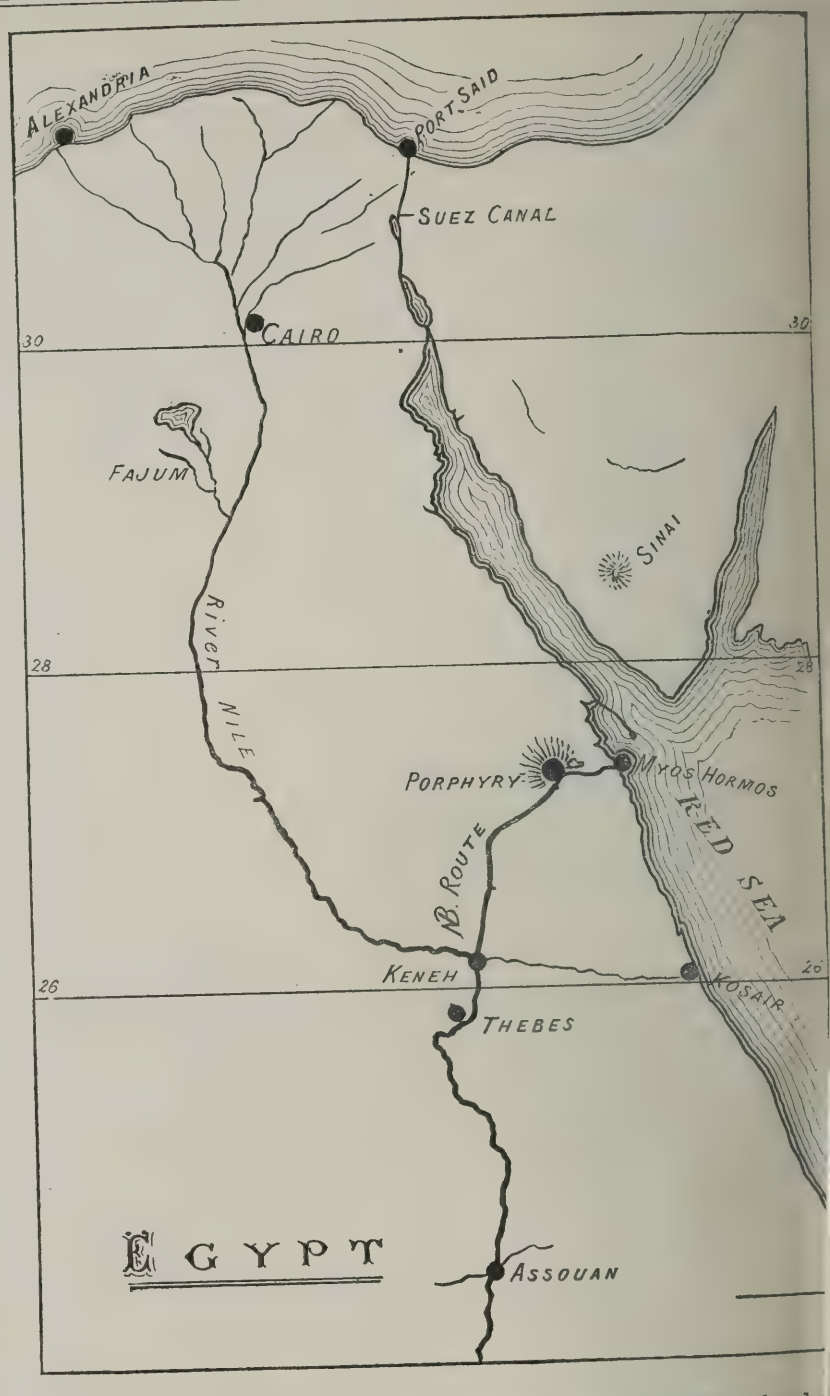
CRUSHING OF STONE BLOCKS FOUR-INCH CUBES (APPROXIMATELY).

Description of stone.	Crushing load in tons.	Stress in tons per sq. ft.	
PORTLAND—			
535	57 665	516·384	Between two mill boards on each face.
536	52 600	469 872	One plate of lead on each face
538	45 65	408·8	One plate of lead on each face ⅛in. smaller than face all round.
537	33 50	299 952	Three plates of lead on each face.
YORKSHIRE GRIT—			
539	79 72	712 080	Between two mill boards on each face.
542	80 05	716·86	Cemented between two strong iron plates with plaster of Paris.
540	56 20	504·432	One lead plate on each face.
541	35 90	322 272	Three plates of lead on each face.

The lead plates were 0·085in. thick.

MR. E. A. FREEMAN ON CHURCH RESTORATION.

SPEAKING at the last meeting of the Bath and Wells Diocesan Charity Societies at Wells, Mr. E. A. Freeman referred to church restoration generally, and to the restoration of St. Alban's Abbey in particular. The question of the restoration of churches was, he re- marked, a difficult one. He thought they might say negatively that our churches should not be treated as St. Alban's had been treated by Lord Grimthorpe. They would lay down that negative proposition, and he supposed very few persons, except Lord Grimthorpe perhaps, would dispute it. But they could not merely put down a negative proposition; they must also attempt to lay down some kind of rule, or, at any rate, they must use their discretion in particular cases. When they came to the restoration of a church, or of any ancient building, or of any ancient object, which is still used for any modern purpose, they had two things to consider, neither of which they could wholly sacrifice to the other; they had the claims of the past and they had the claims of the present. They must treat a church, or, for the matter of that, any building put to modern uses—say a town hall, hall of a college, or any other building that was still, so to speak, alive; they must do what they could to preserve it as a memorial of the past, and still make it useful for the present. And they must further remember that, in keeping up any house or building which had for many centuries been used for a particular purpose, and was still being used for that purpose, they were keeping account of the past and keeping up the his- torical continuity far more than if they pre- served the actual stones and wood of the building and ceased to put it to its uses. He did not know how some of those who laid down a rule against all restoration would meet that proposition. Supposing a part of some great building—say West- minster Abbey, and it was a conceivable case—fell in and became a ruin. Such a case was perfectly possible, but the extreme oppo- nents of restoration, if they were consistent, would say: "Let St. Peter's Church at West- minster fall down and become a ruin rather than that any new work should mingle with the old." Now he thought in such a case as that it would be sinning against historical con- tinuity a great deal more than they would do if they carried out needful and unavoidable repairs. To break the connection with the past, to have no longer the place which was the very centre of English history, the place of the crowning of our Kings, the place through so many centuries of the burial of them—to break our connection with them would be, as it would be if it became a ruin, a greater sin against history and a sin against the past than to make any restoration which was absolutely and physically required. But we must not go further than that. Our ancient churches and buildings were put into our hands as a trust, and we must be very careful not to tamper with them heedlessly, and we assuredly ought never to innovate without great and extraordi- nary cause. We should as a rule keep ourselves to making good any absolutely physical repairs. If a thing was dangerous, if a thing was un- sightly, let them make it good; but of all things they must not go and "innovate" out of their own heads; they must keep to the deposit put into their hands, and not substitute some- thing else for it. It seemed to him that the rule sometimes might be difficult to follow in a particular case; still, as a general rule they would keep up a continuity of history better by restoring, when the restoration was done with the greatest care, putting in no new work that was not absolutely necessary and making no innovations out of their own heads. That, he thought, was a sound principle. A great deal had been done at one time and another which had certainly not been according to that principle, but he hoped they were now getting a little better.



EGYPTIAN PORPHYRY.*

By W. Brindley, F.R.M.S.

MANY persons ask the question, What is Egyptian porphyry? the reply being, It is a red, purple-coloured stone of considerable hardness, susceptible of a high polish, contain- ing white and pink crystals of feldspar, in a silicious paste. It was called Porphyry from its colour, the Imperial purple, the heir ap- parent after Constantine the Great being named "Porphyrogenibus," or born in the porphyry- room, which was at Constantinople. In archi- tecture, under the Cæsars, it was the most valuable material the Empire could produce, and has remained so down to the present day, it being much sought after by the collectors of the world. Grand examples are seen in the monolith columns of St. Sophia, Constanti- nople, and in some of the edifices of Rome. It was also used for sculpture, sarcophagi, &c., and during the Middle Ages immense quan- tities were cut up for costly pavements, similar to the one in the sanctuary of Westminster Abbey, where also a slab may be seen in the tomb of Henry III., concerning which Dean Stanley remarked, "It lit up the Abbey." Ancient writers differed as to the where- abouts of the old quarries, Pliny saying they were in Egypt, and capable of producing blocks of any size. These quarries were actually rediscovered by Burton and Wilkinson in 1823, and visited by Lepsius in 1845, but as neither of them had brought away specimens nor taken any notes as to the quantity of porphyry remaining, their information was not of the practical value it might have been, and as in late years it has been announced that the quarries have been discovered, first in one country, and then in another, it became somewhat perplexing. I have had the pleasure of examining rock specimens of all the locali- ties mentioned by various modern authorities, and have found that none of them are antique porphyry. I therefore resolved to follow the footsteps of Wilkinson. In company with my wife in February of this year, I arrived at Cairo, and was fortunate, through Sir Evelyn Baring, in being introduced to Mr. E. A. Floyer, a gentleman actually conversant with this desert, and who was able to supply me with a map from Kenah on the Nile, to Gimsa on the Red Sea. We then proceeded to the first cataract of the Nile, especially to see the ancient granite quarries that supplied Egypt with material for temples and obelisks. Here

* From a paper read before the British Association on "Egyption Porphyry and its Uses," with an account of a recent visit to the ancient quarries across the Eastern Desert in Egypt.

I observed that these quarries not only supplied the deep red, but the rose, and the dark grey also, the colours often coming in contact upon the same block. The so-called obelisk and other large blocks remaining in the quarries are all of Roman date. The system of quarrying was, in my opinion, by metal wedges, and not wooden, as is generally supposed, the same method being used to break up the immense granite statue of Rameses at Thebes. Returning now to Keneh, where our caravan was formed first of nine camels, which ultimately grew to fifteen and nineteen attendants, all food, water, tents, and bedding, with provender for the camels having to be carried for three weeks, in case of emergency. After several delays, caused through the obstruction of the Mudir, and the obstinacy of the Bedouin Sheiks, we at last started on our way, and, passing through streets of potters, soon reached the outskirts of the desert. The first day we went through a wide plateau, with a well-trodden camel road; the next day we encamped at an ancient Roman station (protected by a picturesque fort on an adjoining height), where fragments of Egyptian porphyry were found. The following day at noon an important station, with reservoir, fort, and wells (now dry) was passed; the road now lay through an extensive open plain. In the evening the low rocks of the igneous range were reached, the gradual ascent to this place from the Nile being 800ft. Next day our road till noon was between hills of red granite and black shale trap rocks; here part of a porphyry column was passed. At luncheon time another important station called the Monastery was reached, where lay a number of porphyry blocks, partly buried in the sand. A ride of fifteen miles through picturesque rocks, with the high mountains in the distance, brought us to the charming valley of Wady Gitta, hemmed in on three sides by precipitous mountains 5,000 to 6,000ft. high, the valley leading to a gorge in which is a dripping well of excellent water, with ferns, figs, and palms. Here the camels drank, a day's rest being taken in this valley, where there is another Roman station. Soon after leaving Gittar we reached the watersheds, the altitude being 2,400ft., the drainage going respectively to the Nile and the Red Sea. We were now by the side of the immense porphyry mountain of Gebel Duchan, and arriving a few hours afterwards at an old Roman station with an interesting fort at the foot of a mountain pass, we decided to encamp, whilst I made my excursion on Gebel Duchan to find the old quarries. The desert route passed over, with its forts and wells, must be older than the Christian era; as Strabo, who visited Egypt in the reign of Augustus, remarks about this route to Myos Hormos (which was the highway to Thebes) as follows: "Now watering-places are provided, water is also obtained by digging to a great depth, and rain-water is found, although rain rarely falls, which is also collected in reservoirs." I began my mountain ascent at 5.30 the next morning, in company with a Bedouin and a Luxor Arab. We followed an ancient Roman road, which went directly from a well near our camp to the pass of the mountain. At an altitude of over 2,000ft. we found a station similar to those in the desert. From here to the summit of the pass the road is a narrow zigzag track on one side of a ravine, and very difficult of ascent, being partly covered with fallen rocks. At 8.30 we arrived at the top of the pass, the height being 3,100ft. Here is a square watch-tower. I had now got very disheartened, not having found in the ascent a fragment of porphyry. The view on the other side revealed a regular amphitheatre of rocks, all bare, like an extinct volcano. In the bottom could be seen an old town (the Medunch), where my companion thought I was going; but espying by the aid of a good field-glass porphyry colouring on the opposite mountain, I resolved to go there. To this my attendants most positively objected. I was further encouraged by seeing that the old path divided half-way down—one part going direct to the town, the other to the purple-tinted mountain opposite. We went on to the junction, where my companion stayed. I took from them my cold tea, lunch, and sketching-satchel, and made them tempting offers of good "backsheish" if they would accompany me, but without avail, so I proceeded alone; but in seven minutes I heard a noise, and found they were following me. On arriving at the foot of the opposite mountain my delight knew no bounds, the grounds being strewn with broken pieces of the most sumptuous porphyry, while a little further on was the actual pitched way or slide, some 15ft. wide, down which the blocks came, with piers at the sides for lowering them. A number of blocks lay here, some of large size and others broken, with several workmen's sheds adjoining. This road for a short distance was very good; but after a while it became strewn with masses of rock, and in many places was utterly destroyed by the periodical torrents, the cloudless sky making the scrambling and climbing most difficult. Near the top the road was good again; but, instead of its leading me into the quarry, I found it was going over the mountain, and could trace it winding down another valley. It was now noon, and I was completely exhausted, so finding shade under a ledge of rock, we took our lunch. I then made a hasty sketch of a most marvellous view over the Red Sea, with Mount Sinai in the distance. Now refreshed, I retraced my steps, and began again to climb. I shortly arrived at a number of workmen's huts, and then at an extensive face of rock in which I expected to find worked veins of porphyry, but could see nothing except "ochre colour." Presently I noticed that the rock and s loose masses were covered with wedge like those in the granite quarries of As I was at a loss to know for what purpo stone had been quarried, or what it reall it looking much like felspar. I knock with the hammer a flake chip, and diately discovered that it was porphy solid rock and everything under my fee the same precious material; the surface was simply an ochre wash from some above. Further examination showed me the Romans had extracted their grandest Not only do these quarries produce th spotted variety, but all the brecciated ki green greys. I noticed one pilaster b large size, partly wedged off by a series in the vertical face of the rock. It wou been almost impossible to expand wedges with water in this position, assert was done. I feel sure they used rather steel tools for dressing the ston cannot see why they should not ha metal wedges. The road I befor tioned as going down in another I think was the road for convey blocks at a later date, as this wou 25 miles between this spot and the M station. In this valley is another to workshops containing unfinished obje altitude of this great quarry I fou

560ft. I determined to return by a path I ould see leading towards the "Meedinah" (the ld town). This path took me by the side of a umber of small quarries of thin bed but good olour, the porphyry being in a grey-coloured ranite extremely rotten, breaking up like dried rth or decayed Purbeck marble. At one spot observed a bust roughly shaped, and mortars rtly finished. We entered the valley about 30, and found the old town on a slight eleva- on above the reach of the torrents. It was uch larger, but very similar to the stations ong the Desert road. In the plain of the lley there is a cistern with piers around it; ese are plastered, and on them are scratched de drawings of ships with single masts. rther up the valley is a small Roman temple the time of Hadrian; the portico is granite, with a Greek inscription which ns thus:—"For the safety and perpetual ccess of our lord, the Emperor Hadrian, d his whole house. This temple and its ecincts were dedicated to the Sun-god, great rapis, and the gods associated with him, by aphroditus Sigerianus, a slave of the nperor, when Ramnius Martidis was prefect Egypt, Marcus Ulpius Chresinus, procurator the quarries, and Rufus Proculeranus perintendent of the marble works)." In a nilar inscription at Djebel Fahurah, where aphroditus dedicated another temple to rapis, A.D. 118, he is called "lessee the quarries." In this temple is a all altar. The whole is now in ruins. the plaster walls of the cell in large l letters, are W 1823, L 1845, S 1877-78. llowing these bad examples, I added in ligo, "WB 1887, and quarries." The letters an respectively Wilkinson, Lepsius, and weinfurth; according to the latter autho- there is another station down the valley, l a depot with a bank for loading the blocks ich were taken to the Nile, a distance of 96 es. The new route will be by a gentle line to the Red Sea, about 25 miles away. Bedouin found in a ravine some good er, and we now made our way back to the p, arriving at the saddle-pass at 5 o'clock, eing sunset, and was quite dark before we l reached the plain. Whilst proceeding in gle file the Bedouin disappeared into a deep ne, escaping with a cut leg, which he ttered with sand. We arrived at the camp late; the dragoman having posted lan- s on the heigths to guide us. After a day est and sketching we returned to Kenah by same route; arriving safely at the Nile r 13 days in the Desert, and 170 miles of el riding. On our return to Cairo terms a concession to work the quarries were ed upon, which have since been ratified.

THE SOCIETY OF ARCHITECTS.

A SPECIAL general meeting of the society was held on Tuesday night at the ty's new rooms, in St. James's Hall, Picca- , Mr. W. H. Seth-Smith, V.P., in the chair. n nominations having been read, the wing twenty-nine gentlemen were elected nembers:—Robert Samuel Allen, Fern s, Carlton-road, Kentish Town, N.W.; k John Brewer, 2, Upper Hill-street, Rich- l, Surrey; Edward Brown, 21, Liverpool- t, E.C.; Henry Francis Clarke, Briton y, Glamorganshire; Ernest John Vale Col- The Vicarage, Andover; Charles Walter r, Banff; Robert William Coventry Dick, ady Somerset-road, Kentish Town, N.W.; en Henry Drake, Beaufort House, Beau- buildings, Strand, W.C.; Stephen Huntley , 22, Hargrave-road, Upper Holloway, N.; nd Walter Evans, 16, Portland-street, mpton; Thomas Farrall, Sherborne, t; Frederick Gotto, The Terrace, n-road, Leighton Buzzard; Valentine , Grantham; James Harvey, Springfield , Baring-street, Plymouth; George m, Euclid House, Ilkeston; Henry Jeffery, 17, High-street, Ashford, John Leaning, 11, Poultry, E.C.; m Mackenzie, 3, Tulloch-street, Ding- Alexander Wood MacNaughton, 6, -street, Edinburgh; Robert Butcher r, South Beach, Blackpool; Harry Bell res, 53, Cornwall-gardens, S.W.; Charles ick Moxon, Beach Cliff, Westgate-on- John Robert Nichols, 59, Colmore-row, Birmingham; John Henry Phillips, 3, Charles-street, Cardiff; John Price, Local Board Offices, Lark-lane, Toxteth Park, Liverpool; Harry William Roberts, Belvoir Chambers, Leicester; Francis Robson, Cathedral-square, Gibraltar; William Alfred Sanders, 50, Queen-street, Exeter; and Anthony Robert Fletcher Trew, 22, Broad-street, Bristol.

The CHAIRMAN said that owing to some clerical error or inadvertence they had been registered as "Society of Architects," in lieu of, as intended, "The Society of Architects," the title which appeared on the certificate. It was thought that now that new stationery was being printed, in consequence of the removal to the present more central and commodious premises, a fitting opportunity had occurred for correcting this, and re-registering the society with the prefix of the definite article. After some remarks from Messrs. E. C. Allam, Worth, Johns, Walter Emden, F. W. Fryer, C. Stanley Pearce, and Ellis Marsland, it was decided with one dissentient to apply for re-registration, and on the motion of Messrs. Allam and Emden, a new rule, to be numbered as the first, was adopted—viz., "That this Society shall be known as 'The Society of Architects.'" Mr. E. Farman presented, on behalf of the secretary, Mr. G. A. T. Middleton, absent through illness, a folio volume of 18th-century engravings of Italian churches, as the nucleus of the library proposed to be formed by the Society in its new rooms. On the motion of Messrs. Stoner and Farman, the gift was accepted with hearty thanks, the chairman expressing a hope that other members would contribute architectural books for the same purpose, as such a library would prove of great value in the future. The chairman called attention to the proposed visit to York in the first week of October, and mentioned that particulars would be furnished to all members communicating with Mr. Middleton not later than the 30th inst.

UNDERGROUND AIR CHAMBERS.

THERE appears to be some justification for the objection entertained against admitting fresh warm air from basement chambers. The plan is easy, and can be applied without difficulty; but, on the other hand, there are rather strong objections to it. The chamber may become a place of storage or refuse, it may communicate too readily with the drains, and in either of these cases the air becomes contaminated before it enters the rooms above. The fresh air admitted may be perfectly pure; but directly it enters the chamber, which really becomes the reservoir of air supply to the building, every room in that case suffers. When the chamber is heated the gases are drawn into it, and are distributed to the several apartments, so that by a foul drain or the entrance of unwholesome ground air the whole supply is rendered unfit for respiration. Such a state of things cannot occur if every room has its own air supply admitted at the floor level—a system which is preferred by several authorities as more healthful. The chief question is how is it best admitted, and how warmed? One authority says the air should come from the east and west sides passing over tubes of hot water, which can be easily provided for. These tubes can be introduced in the skirting, or be collected in recesses in the form of coils. The backs of windows form admirable places for the coils, and the air in this case can be allowed to enter under each window through a grated opening under control. The vertical tube system of introducing air is probably the simplest method for admitting fresh air into ordinary rooms, and of course, the air can be heated by means of gas or hot-water pipes. The use of a large underground chamber has been largely employed because of its economy in a large building. One apparatus, or heating coil, is sufficient, and the chief expense is the carrying up of the necessary flues to the several rooms. By the separate system of introducing air, each room can be warmed independently of the others, or to a different degree by means of stop-cocks; but what is more important is, the air is pure and drawn directly from the outer air, not through the intervention of a chamber in the basement. Another advantage of the system is that the air can be allowed to enter at the breathing level, and this plan has been carried out, we believe, successfully upon the small-pipe system of J. L. Bacon and Co. in several schools and other buildings. The separate system of introducing air is the most natural. Air of uniform temperature in a room is oppressive unless cooler currents mingle with it which produce a continual movement of the air from below upwards, but without draught. Although it is better, no doubt, to keep the floor of a room warm, and the upper part cool, the object is very seldom attained, the upper part of a room soon getting the warmest, while the feet are in a cold bath of air. Proper ventilating arrangements ought in a decisive manner to diminish this undesirable and uncomfortable state of a room by providing inlets and apparatus that can be warmed, and extracting flues at the ceiling level heated by gas jets, or in connection with ventilators in the roof. But the natural condition of things cannot be altogether reversed without artificial aids. Floors of rooms exposed to doors and windows will always be exposed to the colder air by virtue of the law of gases, the heated and expired air ascending as the cold falls down and takes its place; yet even this is a more healthful condition than that of breathing heated air that may be impure, drawn from underground chambers and through long flues.

CHIPS.

The chain which it is the intention of Mr. Herbert Keeling to present to the town of Hanley, in place of the base metal one given by the late Mr. Ricardo, which has grown too shabby for further use by any right-minded mayor with a proper sense of the dignity of his office, will weigh 35oz., will be 60in. in length, and of 18-carat gold. The pendant of the chain will be heart-shaped, having upon it in enamelled work the borough arms in the centre, the Royal Arms of England on each side, with the date of the incorporation of the borough, 1857, at the top, and the date of the present year at the bottom. There will be 26 shields in all.

The committee for the erection of a Trades-hall in Sydney, N.S.W., have selected the design submitted by Mr. J. Smedley, of George-street in that city, among ten sent in. Two premiums of 50 guineas and 25 guineas respectively were offered for the best designs.

At a meeting of master plumbers of Edinburgh held on Friday night, the principle of registration for plumbers was discussed, and eventually a resolution approving of the proposal, both for masters and men, was unanimously agreed to. A committee of thirteen was appointed to take steps in the matter preparatory to a public meeting to be held in the City Chambers under the presidency of the Lord Provost. Some difference of opinion was manifested as to the desirability of co-operating with the London Company of Plumbers, some members of the craft expressing a wish to maintain independence in the movement for registration.

Sir John Fowler, K.C.M.G., M.Inst.C.E., has been appointed a deputy lieutenant for County Inverness.

New premises to be known as Albert Buildings have just been erected in Great Tower-street, E.C., from plans by Mr. F. J. Chambers, of College-hill. They have a frontage of 90ft. to the street, divided into five shops, and the facing materials of the superstructure, which will be let off as offices, are red brick and stone dressings. Messrs. J. and J. Greenwood were the builders.

The Halifax town council have adopted a report by Mr. G. H. Hill, C.E., of Manchester, as to the improvement of the water supply. Mr. Hill recommended that the powers for constructing a reservoir at Walshaw Dean should be revived, that additional storage reservoirs should be formed in the Castle Carr and Ogden Valleys, and that the waterworks at Dean Head (owned by a private company) should be acquired and extended.

The town council of Burton-on-Trent have raised the salary of Mr. Miller, assistant surveyor, from £150 to £170 a year.

The Civil Service Commissioners announce that at an open competitive examination held in Edinburgh on the 23rd August, 1887 and following days, for the situation of Assistant in the Museum of Science and Art, Edinburgh, the undermentioned candidate obtained the first place—Thomas William Nash.

The will of the late Mr. George Benton, railway contractor, who died on the 10th June last, at his residence, Clyne House, Stretford, has been proved in the Manchester District Registry of the Court of Probate, the net personal estate, including leaseholds, being sworn at £605,670 10s. 10d.

WAYSIDE NOTES.

THE notions of some members of Parliament as to what subjects should be included in the curriculum of technical schools are curious. The list, for instance, suggested by Mr. Hunter the other evening is decidedly comprehensive. The honourable gentleman, at the time when the House was in Committee on the Technical Schools (Scotland) Bill, moved an amendment that the following subjects should be taught in board schools:—"Agriculture, drawing, modelling, working in leather, clay, glass, wood, and metal, weaving, dyeing, designing, printing, bleaching, building, machine construction, naval architecture, navigation, civil and mechanical engineering, mathematics, mechanics, natural philosophy, chemistry, metallurgy, textile fabrics, geology, botany, French, and German."

Rather extensive this. Moreover, it is difficult to see how French and German can be included under the head of technical subjects. And, after all, the most liberal scheme of technical education is not of much good if the operative has not the qualities of patience and perseverance, with a readiness to please, that render him infinitely preferable to his employer than excessive knowledge of his craft. What does the British workman say to the stigma of Mr. Archer, the Vice-Consul at Porte Alegre, in Brazil, a note of which appeared in the *Times* of Saturday last? The notice says that Mr. Archer, "writing of the industries in his district, states that an earthenware factory was started in the neighbourhood, many of the necessary materials having been discovered by two Englishmen who were formerly operatives in a wholesale earthenware house in Porte Alegre, and workmen were got from England. The latter, however, gave so much trouble, and the management was so defective, that the factories proved unsuccessful and had to be stopped."

The above looks bad, and worse when we read what Mr. Archer says about his own experience of British workmen in Brazil:—"They are generally given to drink, and are unsteady, exacting, and overbearing, and are a great contrast to foreigners." Complaint is further made that in British undertakings, such as coal-mines, gasworks, &c., Englishmen are generally discharged and their places filled by foreigners—Germans and Italians and others, who are found more steady and reliable. The experience of British contractors and sea-captains even are stated to be the same.

This won't do, even in Brazil. Making every allowance for the fact that men who go to the Colonies and other quarters of the globe are not, as a rule, the best of their class, for the hot climate, and for other disadvantages under which a person would labour in Brazil, there still remains a grave doubt as to whether even these circumstances are sufficiently extenuating to make such offences pardonable. Nothing, indeed, can well excuse habitual insubordination (even in a hot climate) for acts of which we here rightly straightway order a man off a job. Not being a thorough disbeliever in the British workman, I should like to hear what excuses he can urge for the behaviour of his fellow-craftsmen in Brazil.

It is said that those who live in glass houses must not throw stones, and picking holes in the working man reminds me what a lot of mud has been thrown at architects during the last week or so in connection with theatre planning, and also at the profession generally. Much of it may well stick, and remind us of our weak points, and so help the cause of Registration. No time could be more favourable than the present for impressing upon the public the necessity for somewhere breaking the line of descent, which, from *architect*, passes by way of architect and surveyor, surveyor and auctioneer, auctioneer and house-agent, house-agent and undertaker, till we reach undertaker and sweep, and can thus claim fellowship with the "practical chimney cleaner."

Whether the designer of the Exeter theatre was at fault or not but little affects the question at issue. Things should be so ordered that such a person under such a calamity should be above suspicion. The public should be unable to cast mud and filth at the architect. But whilst the present disbanded condition of the profession remains, such it will do, and such it will be perfectly justified in doing, and the sufferers have but themselves and their co-freres to blame.

Why not have Special Diplomas for special branches of our artful-science? For good or for evil, the age is one of specialists, and it is necessary to recognise the fact and not treat it as a phenomenon that has appeared upon the horizon for a season, only to fade away in due course. The increase in population, with its thousand and one wants, the widely extended knowledge in every branch of science, have rendered the specialist a prominent necessity, and desirable, and he will therefore remain. Recognising this fact, then, why cannot the Royal Institute of British Architects (when it is the R.I.B.A. and not merely the R.I. of a few B.A.) arrange a scheme for granting special diplomas, certifying, in the one case, that Mr. A. has proved himself competent to plan and superintend the erection of a theatre or music-hall, and, in another, that Mr. B. may be safely intrusted with the erection of a town or public hall? Other buildings might be specified, and the public would then know where to find their man, and could not, as at present, be astonished to learn that all a young architect has to do in the way of planning in order to pass the Institute examination is a *parsonage house*. A country parsonage house, forsooth! This was the subject set in the exam. of March, 1886.

Mem.: It would not do for all of us to be specialists, as such persons, unfortunately, often get into grooves, and consequently become narrow-minded. A celebrated engineer, if I remember aright, speaking to students at King's College, a few years back, said that "the all-round man could often beat the specialist on his own ground," and he gave his reasons for saying so.

But there is a difference between a specialist who has become such by brag and bombast, and the man who has given his life-studies to a certain subject. The former are public malefactors, and the latter are public benefactors. To produce the latter class of men should be the object of any special diploma system. My idea may be worthless, but I give it in its crude state, trusting that someone will kindly point out the impractibility of the scheme, and put me right. For my own part, it would certainly seem impracticable till the whole profession is one body, with one voice—a body revered and honoured by the public, because of its worthiness for such reverence, its power, and its integrity.

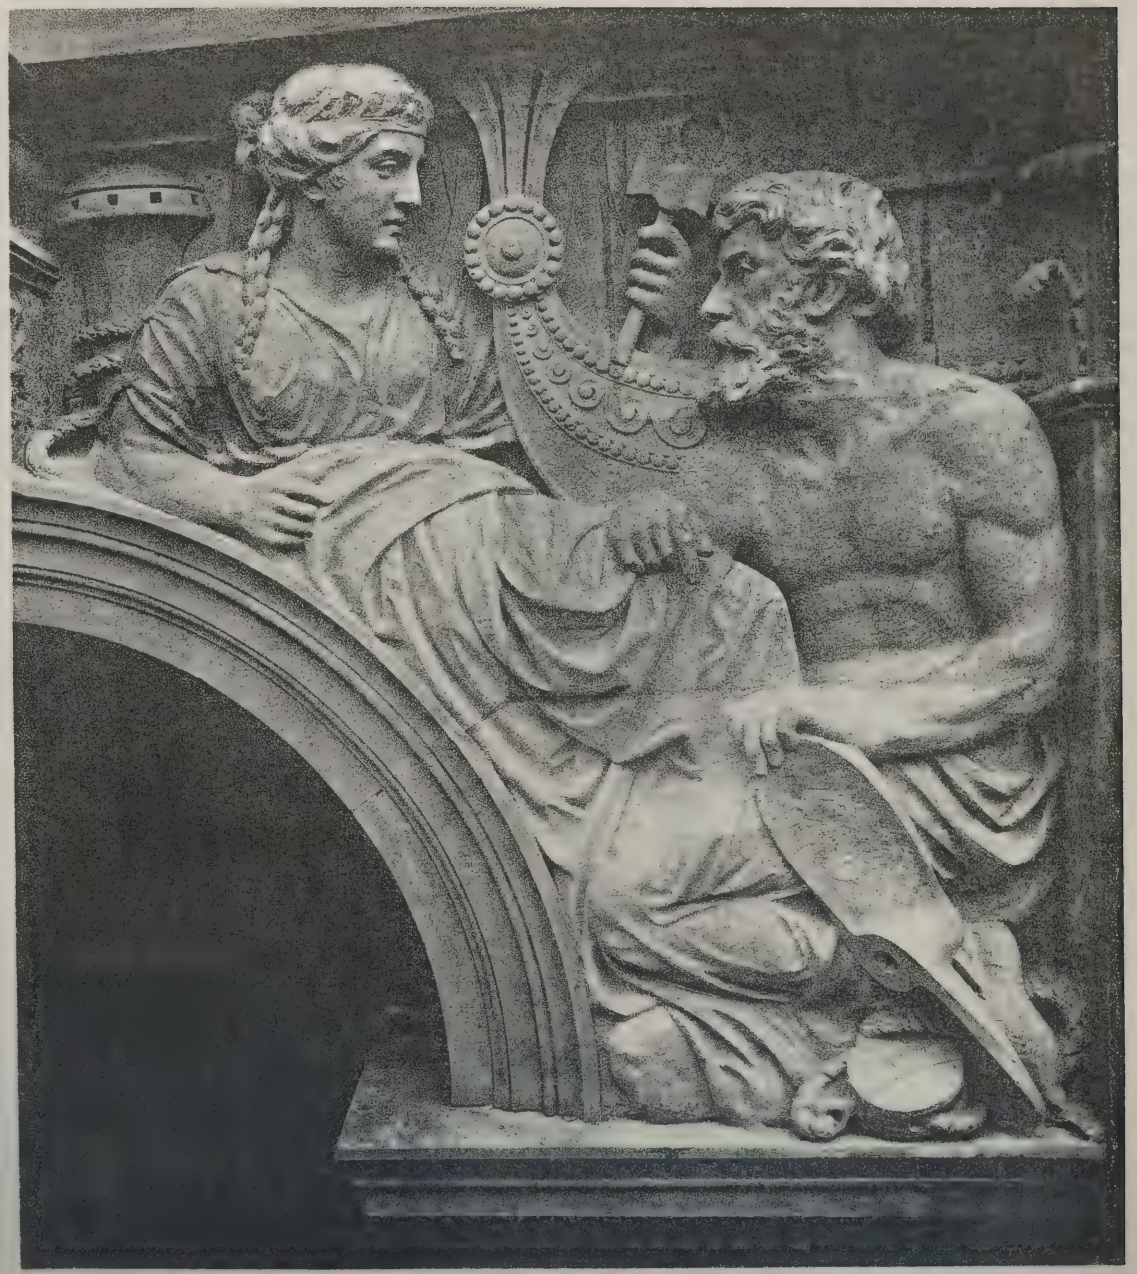
What is a "flat-coloured" plan? The vicar of Carmarthen advertises for plans (flat-coloured) for a church to accommodate 300 persons. I have heard of "flatting" and "flat-tints," but really do not quite comprehend the meaning of flat-coloured plans, though have a suspicion that the reverend gentleman requires geometrical drawings, and not perspectives, or perhaps no shading to the drawings. But I may be wrong, so leave the competition to those who understand the technical process referred to. There are, apparently, no particulars to be given; but this is altogether a matter of detail, and evidently considered superfluous.

Who can definitely solve the latest Chinese puzzle? Does the Great Wall exist, or does it not? If the eye of the camera is to be believed, and excepting for some slight exaggeration in depth of chiaroscuro we have no reason to doubt its honesty, this ancient architectural construction in the Early Chinese style has certainly a genuine existence. The *Graphic* of last week reproduced two photographs (taken, I believe, by military men), which exhibit extensive remains of this extraordinary enterprise of one of the old Chinese Emperors. The photos show the wall running up hill and down dale, and would seem to prove beyond a doubt the existence of, at any rate, large portions of these curious ramparts, designed to keep out the hordes of Tartar barbarians.

When will the conservative Chinaman make a slight alteration in his style of architecture? He cannot so much as lay claim to having seen the rise and fall of any particular method of building. Yet, although the Joss-house and pagoda remain, this excessive conservatism is evidently giving way in other sciences. Lately, at Spithead, there were stationed four Chinese ironclads, with their attendant machine-guns, torpedo-boats, and steam-pinnaces; and bands of Chinese Jack Tars were to be seen frequenting the streets of Portsmouth and Southsea. Possibly old associations endear the Chinese to their style of building. Great, indeed, is the influence of association on our impressions of the beautiful in nature or art. Quoth John Chinaman, in reply to a question from a party of visitors to one of these ironclads at Spithead, "Englishman very good; Englishman very kind; but Englishman *very ugly*."

GOTH.

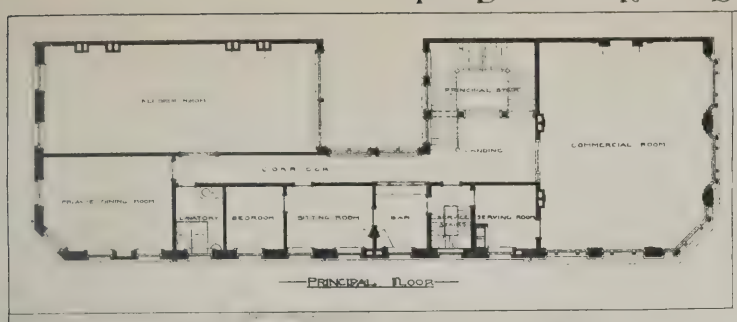
EDINGTON CHURCH, WILTS—SHEET OF MOULDINGS.



A NOTICEABLE feature in the design of this church is that effect is produced by good proportions and rich mouldings, rather than by carving. The mouldings are very bold and rich throughout, and full of teaching, as indicating (even more than the tracery and general forms) a decided advance in the change of style, whilst retaining many of the characteristics of the Decorated period. Thus the inner doorway of the porch has the Decorated wave-mould, quirked at its inner sinking at A on our sheet of mouldings (whilst the outer sinking remains as in earlier work), and the "casement" slightly flattened. The outer doorway of the porch retains the sunk-chamfer, in conjunction with a very Perpendicular type of label.

The reticulated side windows of the chancel and end windows of the transept have the double O.G. (or brace-mould), with a flat casement and an attenuated form of filleted roll, forming a group of mouldings of decidedly Perpendicular character. The east window has the same members, with the addition of the quirk and sunk-plane, to throw into relief the fillets of the inner order of the tracery, which are observable in Bishop Edington's work both here and at Winchester Cathedral. It also has the somewhat unusual arrangement of two filleted rolls set at right angles, forming the inside edge of the jamb: this also occurs in the west porch doorways at Winchester. A similar quirk to that before mentioned is to be noted in the outside splay of the two narrow windows in the transepts, forming (with the line of the splay and that of the outside face) the peculiar angular outer member of the mullions which is seen in the great west window at Winchester. The casement here is flat, and the outer member of the jamb is the quirked wave-mould, as in the inner doorway. The mouldings of the aisle and clerestory windows, the nave, arcade, and the various copings and cornices all show the same mixture of early and late forms, the latter predominating, but all are rich and beautifully designed.

The leading principle in the construction of the groups of mouldings at Edington is the well-recognised characteristic of Perpendicular work—viz., that all lie on the *splay* or *chamfer-plane*, and the projecting points of the various members all touch the line of the plane. The splays, whether sunk or not, are also parallel to this line, so that the moulding are sunk from the surface represented by it. This applies, not only to jamb and arch mouldings, but also to the cornices and string courses.



All the mouldings shown on our sheet are reduced from full-size sections measured and plotted by the architect for the restoration of the church—Mr. C. E. Ponting, of Marlborough, who has also lent us some sketches of the beautiful niches in the chancel. At an early date we propose to give photolithographic reproductions of these studies. An elevation of the west end of this church was published in the BUILDING NEWS for August 12 last, when a plan of the building was given with Canon Jackson's paper in description of its history. Two charming drawings of the church by the late Fr. C. Deshon (now in the possession of Mr. J. Gandy) will be found illustrated in the BUILDING NEWS for July 12, 1872.

SELECTIONS FROM THE ROYAL ACADEMY EXHIBITION.

THIS plate forms the last sheet of selections which we have prepared in illustration of the artists' own sketches of their pictures at the Royal Academy Exhibition this year. Pressure of other subjects prevented us from concluding the series earlier, and the painters of the works now represented must excuse the delay mentioned for the simple reasons now given. The central picture, called "Morning," is a single female figure in picturesque pose and gay costume, by Mr. Marcus Stone, R.A. Round this study are arranged subjects of very varied motiff, embodying ideas of an equally diverse character, making thereby the choice, which is thus placed before our readers, all the more interesting. Mr. Herbert Dicksee with much pathos represents "Grandfather at the Grave of Little Nell." This is the incident, as briefly recorded in "The Old Curiosity Shop": "At length, they found that he had risen early, and with his knapsack on his back, his staff in his hand, her own straw hat, and little basket full of such things as she had been used to carry, was gone. As they were making ready to pursue him far and wide, a frightened schoolboy came who had seen him but a moment before sitting in the church—'upon her grave,' he said. They hastened there, and going softly to the door, espied him, in the attitude of one who waited patiently. . . . When it grew quite dark he rose and returned home, and went to bed, murmuring to himself, 'She will come to-morrow.' Upon the morrow he was there again from sunrise until night . . . and thenceforth every day and all day long he waited at her grave for her. . . . The last time was on a genial day in spring. He did not return at his usual hour, and they went to seek him. He was lying dead upon the stone. They laid him by the side of her whom he had loved so well; and in the church where they had often prayed, and mused, and lingered hand in hand, the child and the old man slept together." "Then when the dusk of evening had come on, and not a sound disturbed the sacred stillness of the place, when the bright moon poured in her light on tomb and monument, on pillar, wall, and arch, and most of all (it seemed to them) upon the grave—in that calm time, when outward things and inward thoughts teem with assurances of immortality, and worldly hopes and fears are humbled in the dust before them—then with tranquil and submissive hearts they turned away and left the dead with God." "The Head of the Gang" is a pen-and-ink study by the artist of his picture called "Bush-rangers," and the incident so graphically painted by Mr. William Strutt may be thus described. The scene is on a suburban road at a short distance from Melbourne, where, in the year 1852, a desperate gang of bushrangers formed the plan to waylay and rob all the travellers along the well-frequented thoroughfare from St. Hilda and Brighton to Melbourne. The project has been successfully carried out, and the unfortunate victims, fleeced of all their valuables, are seen tied together in twos sitting on the ground under guard of two desperadoes with loaded rifles. For nearly three hours the unfortunate sufferers were thus kept in mortal terror of the robbers, who, on completing the preliminaries for so good a haul, mounted their horses and made off. Thus left to their own resources, the prisoners at length succeeded in releasing themselves and returned to their homes. A lady and gentleman numbering among the rest, thus pinioned, are shown in the sketch sent us by Mr. Strutt, and during the affray a man of the party was shot dead. This daring feat was accomplished in broad daylight some two or three miles distant from where the artist resided when in Australia. The dresses are contemporary with the incident, most of them being brought by Mr. Strutt from the Colony. The scenery is studied from nature, and the author has reason to congratulate himself on the popularity of his picture throughout the exhibition. The delicate landscape, "By Flowing Stream through Wood and Craggy Wild," by Mr. Albert Kinsley, is marked by a refinement and knowledge of nature which deserves more than a passing comment. The silver birch trees, the overgrown banks of the rambling stream, the distant hills, and the tender foliage of the foreground are all in keeping with the scale adopted in the work. It was painted in late autumn, and represents a scene in Yorkshire. The size of the canvas is 42in. by 72in. In the other landscape which we reproduce, Mr. Alfred East, its painter, carries us up further north to "The Land between the Lochs," in the beautiful neighbourhood of the Trossachs, where, during the months of October and November last year, he finished this work of love and skill in the open air. It represents the country which lies between the Lochs Achray and Vennachar, in the valley of the Black Water, or Teith as it is called, after it leaves the last-named loch. The view is from Duncraggan; the flat lands to the left of the picture are Kendrick Meads, the gathering place of the Macgregors, and the distant hills are those which separate it from the Valley of Aberfoyle and Loch Ard. The artist has most cleverly given the effect of an early winter afternoon clearing up for a frost. This delightful scene is spoken of in the "Lady of the Lake." Turning from these peaceful scenes of nature, we have two renderings of "Jealousy" from quite opposite points of view, which furnish much for many a reflection. In Mr. Ernest Norman's powerful picture, "Jealousy" is represented "cruel as the grave." A Moorish beauty reclining on her sumptuous divan, as Eastern ladies in her position are wont to do, languidly passing away her time by the amusements afforded in the busy street, suddenly discovers her lord and master in the crowd over the way; so, raising herself to watch his movements through the mesherebeyeh of her lattice window, she sees him, unconscious of the espionage, engaged in a stolen embrace with a slave girl, whose attractive form he has intercepted on her way to the harem, to which she was carrying in refreshments. Inflamed by a woman's hate, her mistress, with flashing eye and compressed lips, awaits the coming of her newly-discovered, though, perhaps, for some time suspected, rival, while instinctively her revengeful hand steals towards the weapon lying by her side secreted among the soft cushions of the couch. Nemesis, swift and unrelenting, threatens the luckless Hebe. Of the sentiment more need not be said. All that skill and colour can lend have been realised in the portrayal of this "the home of Love." "Jealousy," as depicted by Mrs. Herbert G. Moberly, if more common-place in idea and less ambitious in design, strikes at a simpler and a purer chord. A fair-haired English girl, in long, flowing drapery of soft colours and everyday costume, sits writing at an old-fashioned bureau, engaged on a very particular letter, in the special wording of which she finds some difficulty, the result possibly of inexperience, coupled with a feeling not easily described. By an instinctiveness which strikes the fair correspondent as equally remarkable, her favourite pet spaniel, who has hitherto monopolised all her attention, exhibits a restlessness which by no means assists the conclusion of the letter, and so exercises a not unnatural feeling of modest jealousy, and gives a title to the picture.

ST. MARY'S CHURCH, EAST LEAKE.

THE works of reparation at the church of St. Mary, East Leake, near Loughborough, consist of the strengthening of the tower and the rebuilding of the spire, which was much shattered by lightning. The nave has been repaired, reseated, and rearranged, the former high seating being adapted and painted a dark green; the chancel and chancel arch rebuilt stone by stone where possible, and a new roof constructed, replacing the low-pitched modern plaster roof, an organ-chamber and vestry being added on the north side. An altar, with altar cloths and dossal, has been provided, and oak clergy and choir seats. Hollington stone is used for the dressings, and stone from a local quarry for the rubble walling. The north wall of nave contains some interesting Norman remains, and the tower arch is of well-proportioned early work; but the church generally is of 15th century with repairs of the 18th century. There are evidences of the chancel-screen and rood, and of the screens inclosing the chapel at the east end of south aisle. The windows here are very beautiful, and almost unique in treatment. The church possesses a curious wrought-iron trumpet for augmenting the voices of the singers; it is 7ft. 6in. long, with bell-mouth 1ft. 9in. across. Three others are known to exist—namely, at Willoughton, Lincolnshire, and at Harrington and Braybrooke, neighbouring villages in Northamptonshire. The one at Thorney, Nottinghamshire, was lost at the rebuilding of the church about 1850. The bass of the chant was hummed through these trumpets, a performance known as "vamping the bass." The architect under whose superintendence the works have been carried out is Mr. W. S. Weatherley, of 20, Cockspur-street, London.

ENTRANCE AND LOGGIA, 49, UPPER GROSVENOR-STREET, W.

THE photo-litho. of this Royal Academy drawing shows part of a block of mansions now building in Grosvenor-square. These houses erecting at the south-west corner of Grosvenor-square are from the designs, and are being built under the superintendence, of Mr. W. H. Powell, architect. The buildings are faced with red pressed bricks, red rubbers being used for the gauged arches, carved frieze, spandrels, &c. The several contractors are Messrs. Patman and Fotheringham for the main structure, and a portion of the finishings will be done by Messrs. Longmire and Burge. Mr. Walter Mitchell is the clerk of works.

SCULPTURE FROM THE MUNICIPAL BUILDINGS, GLASGOW.

THESE illustrations are from the spandrels representing "Shipbuilding" and "Engineering," by Mr. Mossman, sculptor, of Glasgow. They form part of the ornamentation of the new Municipal Buildings at Glasgow, now being erected from the designs of Mr. William Young.

ROYAL HOTEL BUILDINGS, DARLEY-STREET, BRADFORD.

THESE buildings are in course of erection for Mr. James Lazenby upon 514 square yards of land, forming part of the site of Christ Church, which, with adjoining land, was acquired by the Corporation for street improvements, and, after diverting and widening the streets, was sold in plots for business premises. The basement, sub-basement, and ground floors at the rear of the block are constructed for wool warehousing, part of the ground floor and basement in Darley-street is arranged in shop premises, and the remaining portion of the basement, part of the ground floors, and the whole of the upper floors of the building are arranged as an hotel, containing entrance hall, staircase and

lavatory, and extensive stock rooms on ground floor, commercial, private, dining, billiard, serving, and other rooms on the first floor (as shown on plan), and thirty-five bedrooms on second, third, and fourth floors, with all the necessary adjuncts. The culinary department, and washhouse and laundry are situated on the top floor, and the hotel will be fitted with all the latest appliances requisite for a first-class commercial house. The building to the right is being erected on 131 square yards of land for Mr. N. W. Noakes, and is arranged and will be fitted up with all modern improvements for a first-class hair-dressing and perfumery business. At the rear of the latter premises, and facing Piccadilly, a block of wool warehouses, occupying 521 square yards of land, and seven stories in height, is in course of erection for Mr. Joseph Hey. All these buildings are built of stone, those facing into Darley-street and part of Upper Piccadilly being faced with ashlar, and the works are carried out by local contractors. Mr. James Ledingham, A.R.I.B.A., of Bradford, is the architect.

PASTORAL STAFF OF ARCHBISHOP VALARESSO, AT ZARA.

THE most perfect *souvenir* of this magnificent prelate which Zara possesses is the very beautiful and quaint pastoral staff which he gave to the cathedral. It is of silver, parcel gilt, and bears the inscription :—

R+D.+MAFEVS+VALARESSVS+
ARCHIEPVS
HVADRENSIS+FACIENDVM+CURAVIT .
M . CCCCLX+.

From the circumference of the crook radiates 11 little figures. In the centre is the figure of Christ standing on a rock, and on each side of Him are five little half-length figures springing out of flowers, and facing alternately to each side of the staff. Each holds a scroll with his name, ELIA . P——SIMON . PA——AMOS . P. IEROBOAM (whom one is surprised to find in such good company); TVBIA——MOSE . P——IEREMIA . P.——DANIEL . P. ARON . P. IACOBE.* In the centre of the crook are statuettes of a female figure crowned and holding a book, and a bishop with a pallium, who holds out a book with his right hand. These have been variously supposed to be the Virgin Mary and Archbishop Valaresso, the donor, or St. Donato and St. Anastasia, the patron saints of Zara. It may be objected to the latter interpretation that Donato was not an archbishop, and would not have the pallium. The neck below the crook has been modernised, but all the rest of the pastoral is perfect and original. The next stage is a rich piece of tabernacle work, triangular in plan, with a pinnacle at each corner, and two stories high. In the upper stage the three faces are occupied by St. Peter, St. Jerome (?), and a bald saint holding a book; in the lower by a Madonna with the Holy Child, a figure of Our Lord issuing from the tomb, and a saint also apparently stepping out of a tomb. St. George and two female saints occupy niches in the angle pinnacles. The staff is plated with silver, and the total height of the pastoral is 6ft. 6in. The workmanship is very fine, the little figures are cast and engraved with a tool, and the foliage of the flowers out of which the prophets emerge is beautifully finished with file and graver. This is the description which accompanies the illustration of this exquisite example of silversmith's work in Mr. T. G. Jackson's admirable book on Dalmatia and Istria,† and we are indebted to the author for the loan of his original drawing of the pastoral, which we have reproduced to-day to an enlarged scale to show the delicate detail in the finer parts of the staff. Scales are drawn on the sheet for reference. We gave other illustrations from Mr. Jackson's book with our review of the work in the BUILDING NEWS for July 22nd last. The Duomo treasury at Zara is very rich in church plate, and among the more remarkable pieces are a reliquary supported by four dragons with wings; a coffer containing the head of St. Giacomo, a 5th-century martyr; the reliquary of St. Grisogono, with medallions of enamel on the lid; St. Orontius's reliquary; another of St. John the Baptist, professing to contain one of his fingers, and a reliquary in the form of an arm. This last referred to is the best of the numerous arms in the treasury.

* The labels with TVBIA and IACOBE are not original.

† "Dalmatia, the Quarnero and Istra," by T. G. JACKSON, M.A. Oxford; At the Clarendon Press, 1887.

STANYARD HILL, CHOBHAM.

THIS house has been built on high ground near the village of Ottershaw; it has been planned so that the windows of the reception rooms may command the extensive views over the Hogsback, about 15 miles to the south, and the Chobham and Frimley ridges to the west. It is built with the local red bricks, the external walls being 16in. in thickness, with a 2in. cavity. It stands in picturesque and undulating grounds of upwards of 50 acres, which have been laid out with great skill by Mr. H. E. Milner, of Dulwich Wood, Norwood. Mr. Theophilus Allen is the architect, who has built the house for his own occupation; Messrs. T. Knight and Sons, of Chertsey, being the builders.

CHIPS.

The parish church of Clevedon, Somerset, was lit with gas for the first time on Sunday, the work having been carried out by Messrs. Wippell, of Exeter.

From a recent return it appears that there are 2,281 building societies in the United Kingdom. The receipts of 2,000 of them are more than 20 millions—an average of £10,000 a piece. Their liabilities are more than 50 millions. There are only five such societies in Scotland, and only 44 in Ireland; but the English and Welsh societies have a membership of hardly lower than 600,000 men.

A new Baptist chapel is about to be built at Sandy, Beds, at a cost of about £1,800. Messrs. Usher and Anthony, of St. Paul's-square, Bedford, are the architects; and Mr. Wade, of St. Neot's, Hunts, is the contractor.

After some months' trial the system of "building-permit fees" has been abolished in Minneapolis, and a resolution will come up before the council recommending that all fees paid in during the time the system has been in force be refunded.

A new police station is about to be built at Newton Heath, from plans by Mr. W. T. Gunson, of Marsden-street, Manchester.

A board school is being built at Bothwell, N.B., from plans by Messrs. Bruce and Hay. The contract for masonry has been taken by Messrs. Miller and Kenwick, of Bothwell, for £1,436, and that for wrights' work by Mr. G. R. Havrie, of Belshill, for £688.

The Dewsbury school board are about to provide accommodation for 900 children in a building to be called the Jubilee Queen Victoria School. Mr. J. L. Fox, of Central-buildings, Dewsbury, is the architect.

It has been decided to erect, at a cost of between £6,000 and £7,000, a new Congregational church at Higher Audley, Blackburn.

The post-office at Lincoln is being enlarged in order to provide more adequately for the telegraphic work. The work, which is in the hands of Mr. G. Morgan, builder and Government contractor, is expected to be finished two months hence.

The deputy coroner for Central Middlesex held an inquiry on Saturday respecting the death of Henry Kelly, aged 68, a builder, living at No. 2, Caversham-road, Kentish Town. Annie Kelly, the widow, stated that the deceased two years ago had a terrible fall, fracturing his skull, and since then he had been partially paralysed. He had been very unsuccessful in business all his life, and lately more so. On Monday, the 5th inst., he left home, and she saw no more of him, and heard on Wednesday that he had hanged himself. A verdict of "Suicide whilst of Unsound Mind" was returned by the jury.

The Durham and Northumberland Archæological Society had an excursion in South Durham on Friday. The first place visited was Heighington, where the church and other objects of interest were inspected. The Rev. J. F. Hodson and Rev. Canon Greenwell accompanied the party, who then drove to Walworth Castle, where the remains of a Norman chapel were viewed. Thornton Hall was then inspected, and subsequently Croft Church, with its Saxon remains.

The Albert Memorial Church, Queen's-road, Manchester, was reopened on Sunday, after renovation carried out by Mr. Reuben Bennett, of Manchester.

An Oddfellows' hall is being built at Woolston, Southampton, from plans by Mr. John H. Blizard, of Southampton. Mr. John Hinton, of Woolston, is the builder.

Building Intelligence.

BIRMINGHAM.—A Wesleyan Chapel, schools, and Central Hall, which have been erected on a site having frontages to Corporation-street, the Lower Priory-street, and Dalton-street were opened on the 8th inst. The buildings comprise a chapel, a large hall for meetings, Sunday schools, including ragged and infants' schools, class-rooms, and a house for caretaker. The frontage to Corporation-street on the ground floor has been utilised for shops. The buildings are in the Early English style, the materials used being Darley Dale stone for the ground floor, and red brick with stone dressings for the remainder of the elevations. The building is surmounted by a tiled roof. The chapel and hall occupy the whole of the first floor, and are approached by a wide staircase from the centre of the Corportion-street front. The chapel, which will seat 350 persons, has an apsidal end in which the communion table is placed, the pulpit being on the left-hand side adjoining the vestries, and the choir and organ on the right-hand side. There is a gallery at the opposite end. The ceiling is panelled, the walls are plastered, and the dados and dressings to lancet windows are of brick. The Central Hall at the rear of chapel has accomodation for upwards of 1,000 people, and has three entrances. It is lighted on three sides, and has galleries at the sides and ends, with a raised platform and orchestra, the latter furnished with a large organ. The total cost has been about £11,000. The architects are Messrs. Osborn and Reading, of Bennett's Hill, Birmingham, and the builder is Mr. John Bowen, of Balsall Heath.

CARDIFF.—A large malt-house on the East Moors, Cardiff, is approaching completion. It will contain four steeping tanks, four growing floors, and four kiln floors, and will be capable of manfacturing 900 quarters of malt a month. It is five stories in height, besides a malt store in the roof holding more than 2,900 quarters. There is also a malt store in the kilns with a capacity for 1,500 quarters. In the barley loft which occupies the fourth floor, there is room for 1,200 quarters. This loft contains the gas-engine and shafting for driving the elevators, carrying band, and the sack-hoists; and the four iron steeping cisterns are placed here also. The kilns are two in number, and each has an upper and lower drying floor. The upper drying floor is of Hermann's patent wire. The dimensions are as follows :—Length of main building, 113ft.; total length, including kilns, 147ft.; breadth, 53ft.; breadth across kilns 73ft.; height, to ridge of roof, 60ft.; height of kiln, 73ft. The contractors for the building are Messrs. Sheppard and Son, of Cardiff. Messrs. Williams and Son having supplied and fixed the iron stanchions and girders. Messrs. Cross Brothers have carried out the water and gas services; Messrs. Stopes and Co., of London, the tile and wire drying floors; Messrs. Goddard and Massey, of Nottingham, the steeping tanks, and Messrs. Spencer and Co., of Melksham, are fixing the machinery and the gas engine. Mr. John Gillett, of Penarth, has acted as advising engineer. The architect is Mr. F. Baldwin, of Church-street, Cardiff.

CANTERBURY.—New banking premises are now being erected at Canterbury for Messrs. Hammond and Co. The original design was by the late Mr. J. Green Hall, F.R.I.B.A., of Canterbury, in the Early English style; but the design not being in harmony with the surrounding buildings, it was decided to adapt the Early Tudor style to the requirements of a bank. A fresh design was accordingly prepared by Mr. W. J. Jennings (to whom on the death of Mr. Hall the work was intrusted) in that style. The materials of each façade consist of red Suffolk bricks, Ancaster and Stoke Ground-stone dressings. The accommodation comprises large banking room, bank parlour, manager's room, call-over room, two large strong rooms and other offices on the ground floor, and a residence for the senior clerk on the first floor. The fittings throughout the banking room will be of American walnut wood. The builder is Mr. Wilson, of Canterbury, who has undertaken to carry out the works for £6,000 by private tender.

CHESTER-LE-STREET.—The extensive building works commenced by the Chester-le-Stree

Co-operative Society two years ago are now on the point of completion. New shops, &c., for the following departments have been provided —viz., drapery, boots, shoes, and hardware; tailoring, millinery, furnishings, butchering, and groceries, besides cocoa room and restaurant; reading room, library, and lavatories for ladies and gentlemen. Extensive stabling and cart shed accommodation have been provided, together with cattle lairs and slaughter-house. Thirty-one cottages have also been erected containing four and five rooms each, and the adjoining streets paved and sewered. The total cost has been about £14,000, excluding value of land. The work has been divided among various contractors, the principal being Messrs. J. Burnett and Son, of Birtley; Mr. Wm. Thompson, of Chester-le-Street; and Mr. John Yeeles, of Jarrow. The architects from whose plans and under whose superintendence the whole has been carried out are Messrs. S. Oswald and Son, of Newcastle-on-Tyne.

North Witham, Lincolnshire.—The parish church was reopened on Thursday last, after a complete restoration, by the Bishop of Lincoln. The nave and chancel are of Roman work, with a fine tower and spire of late 14th-century work, at which date all the windows and roof were added. The roofs have been reconstructed to old pitch in Dantzic oak, and the lead recast in churchyard and relaid, all the stonework repaired and new buttresses added, the internal plaster removed and walls repointed. The chancel arch being only 6ft. wide, the altar has been brought into middle of chancel, and the choir stalls placed west of same, the remainder of nave being seated with oak benches. The work has been well done by Mr. Ware, builder, of St. Neot's, under the direction and personal supervision of Mr. Withers, architect.

Southport was *en fête* on Wednesday week, when the formal opening of the Marine Park and Lake, which have been constructed on the foreshore, a capital recreation ground situated at the Duke-street end of the promenade, and a new Museum of Science and Art Schools in Lord-street, took place. The Marine Park lies between the Promenade and the Channel, on what was, till recently, a swampy and flat stretch of foreshore. Under the direction of Mr. Halewood, 16 acres has been formed in a boating lake, and the remaining 7½ acres has been laid out with turf and winding walks, and planted with shrubs, the total cost of the transformation being £12,000. Upon the recreation grounds £3,000 have been spent, also under Mr. Halewood's supervision, and they cover about nine acres. They are situated on the Southport and Cheshire Lines Railway, and between the sea and the shore building line. The schools and museum have been erected from plans by Mr. E. W. Johnson, of Southport, and form one block placed between the Cambridge Hall and Art Galleries; an open gallery connects all three buildings on the first floor level. The portion devoted to art classes is on the second floor. There is a large examination or lecture hall, and several smaller rooms. The ground floor contains rooms for chemistry classes. All the floors are paved with wooden blocks. The site was given by the Corporation, the estimated value being £2,000. A further sum of £5,000 was spent by the Corporation on the building, and in addition also £1,000 each was contributed by two donors, and a grant of £1,000 from the Science and Art Department for the fittings, the total expenditure being thus brought up to £9,000.

Walford. — The parish church of St. Leonard, which, with the exception of 15th-century windows inserted in the chancel and Kyrle Chapel, is of the Early English period, has just been restored, from plans by Messrs. Nicholson and Son, of Hereford. The roofs have been reconstructed in oak, sheeted with oak, and covered with stone tiles and stone cut ridges. The building has been strengthened, the plaster daub and colour wash removed from the walls, the gables re-coped and finished with crosses. The floors are laid with solid wood blocks set in mastic upon concrete, and the nave and aisle are re-furnished with oak sittings, pulpit, and eagle lectern. A hot-water apparatus, upon the small-bore pipe system, has been supplied and fitted by Mr. Renton Gibbs, of Liverpool, for the warming of the church. In the early part of the century the spire was struck with lightning, and fell bodily into the churchyard. The building suffers greatly in consequence of the loss of this feature, which has not been replaced in the present works. The squinches upon which it was carried still remain in the angles within the upper stage of the tower. The contractor was Mr. Morgan, of Rockfield, near Monmouth, the amount of the contract being £1,575, which with the extras has been increased to £1,700. Among the special gifts is a new organ, built by Messrs. Holmshaw, of Birmingham, at a cost of £300.

Walton, Liverpool.—The memorial stones of a new Baptist chapel in Rice-lane, Walton, to be built at a cost of £2,200, were laid on Friday. The chapel will be built of grey bricks, having Runcorn stone and red pressed brick dressings, and will be in the 14th-century style. The plan is a parallelogram, 60ft. by 41ft. 6in. inside, and 37ft. to the apex of the ceiling. Sitting room will be provided for 420 persons on the ground floor, and provision is made for the future erection of a west gallery to accommodate 100 persons. In a recess at the east end, divided from the body of the chapel by a moulded arch, will be the pulpit, in front of which will be placed the baptistery. The edifice will have large traceried windows at the side, a rose window over the pulpit, and a four-light traceried window in the west gable. The principal timbers of the roof will be of pitch pine, stained and varnished, and will be supported by wrought and open-framed hammer-beam trusses, with curved and chamfered braces, resting upon moulded and carved stone corbels. Between each principal, upon longitudinal curved brackets springing from the hammer beam, will be formed a clerestory of 24 lights on each side. The pews and other fittings will be of yellow pine. The exterior roof will be covered with Bangor slates, having red ridge tiles. The chapel will be heated by hot water. Provision is made to erect at a future time a schoolroom, two classrooms, and also a tower having a spire rising to a height of 102ft. The building is being erected by Mr. John Millar, Nelson-place, Wavertree-road, Liverpool, from the designs of Mr. Thomas E. Murray, Liverpool.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Sheffield Society of Architects and Surveyors.—The following officers have been elected to serve during the session 1887-8 of this newly-established society:—President, Mr. T. J. Flockton; vice-president, Mr. F. Fowler; treasurer, Mr. J. B. Mitchell-Withers; council, Messrs. C. J. Innocent, C. Hadfield, J. D. Webster, E. M. Gibbs, fellows, and E. Holmes, associate member.

Norwich Castle, which in feudal times figured boldly while held by Roger Bigod, has for many years formed the county prison, and has been re-cased with masonry throughout, and gutted of most of its internal fittings. The Government authorities, having built a new home for felons on Mousehold, a height near the city overlooking the Cavalry Barracks, Norwich Castle was offered to the town council for £10,000. Of this sum the late Mr. John Gurney contributed £5,000; and the building has been formally handed over to the corporation, the purchase being complete.

The water commissioners of Dumfries and Maxwelltown have adopted a detailed report and scheme by Mr. James Wilson, C.E., Greenock, for bringing a new water supply into the towns from the Old Water and the Glen Burn. The scheme involves the construction of a reservoir on the former stream at Cornlee, having a capacity of 250 million gallons, and of an intake dam on the Glen Burn, the water from both sources being led in pipes to the present filtering pipes at Lochfoot. The cost is estimated at £30,180, exclusive of the purchase price of the land and the outlay involved in obtaining Parliamentary powers.

Mr. Havard Thomas, of Fulham, the sculptor of the Bristol statue of Samuel Morley, has been selected as the sculptor of the statue to be erected at Nottingham. The figure for Nottingham will not be a replica of the Bristol statue, but it will be of the same dimensions in a different position.

A group of industrial schools for girls have just been commenced to be built in Dialstone-lane, Offerton, near Stockport. Mr. J. Hunt, of Stockport, is the architect, and Messrs. Froggatt and Briggs, of the same town, are the contractors. The cost will be about £3,000.

Engineering Notes.

Greenock and Gourock Railway.—The works on this railway are in active progress, over a thousand men being employed on the work. A considerable portion of the tunnelling, the erection of stations, and of the quay at the terminus are yet far from being completed; but the cuttings along the whole route are well forward, and the railway will be completed by the end of next year. Messrs. Watt and Wilson, Glasgow, the contractors for the Greenock section, have carried out much of the work in the vicinity of Cathcart-street Station, where the new line for Gourock breaks off. The new station will be 420ft. in length, and 100ft. broad. The height of the walls will be 33ft., and the roof is of 13 girders, extending from wall to wall. Light steel couples and tie-rods will be used, and the glazing will be on Pennycuik's system. The chief work in this section is a tunnel 227 yards long. The second, or Gourock section—for which Messrs. Hugh Kennedy and Sons, Partick, are the contractors—begins at Bruce-street, Greenock, and goes to the terminus at Gourock Quay. The heaviest portion is the boring of a tunnel about a mile in length between Newton-street and Dunn's Farm. On this section five bridges are to be erected, and four of them have already been put up. In front of Gourock the bay has been filled up 20ft. out with material from the tunnel and cuttings. A staff of men are also engaged at the erection of the Gourock quay, which is to be of great length. The piles for a considerable part have been already driven, and a good portion of the concrete wall, which composes the face of the quay, has been laid.

CHIPS.

The Leeds town council have decided to discountenance on sanitary grounds the use of standpipes for domestic purposes. Six months' notice has been given of the intention of the corporation not to allow their employment, and if in the mean time any such pipes become unfit for use, they are not to be repaired, while for the future no stand pipes are to be erected in the borough. There are now 401 standpipes in Leeds, which supply 3,130 houses, occupied by the poorer classes, with water.

Mr. Thomas J. W. Harrower, the engineer of the Danube and Black Sea Railway, now in progress, died on the 29th ult. at Kasterdjil in Roumania, in the 34th year of his age.

It was reported to the Lincoln City Council last week that Mr. J. L. Pearson, R.A., had agreed to accept a fee of fifty guineas and five guineas for travelling and other expenses in connection with the restoration of the Stonebow. The sum was ordered to be paid, members of the council remarking that it was an exceedingly moderate charge.

Mr. William Fraser, of Exchange Station, Liverpool, assistant-engineer and surveyor, and a member of the Sanitary Institute of Great Britain, has been appointed inspector of nuisances and surveyor for the Newmarket rural sanitary district, at a salary of £120 per annum.

A large country mansion is in progress at Gallowhill, near Bolam, for Mr. Charles Perkins, J.P. The contractors are Messrs. Joseph Burnett and Son, of Birtley; and the architects are Messrs. Sept. Oswald and Son, of Newcastle-on-Tyne.

New business premises are in course of erection in Bridge-street, Newcastle, for Alderman G. B. Grey. Mr. James Waterston, mason, and Messrs. G. and C. Haswell, joiners, are the contractors employed. The architects are Messrs. Sept. Oswald and Son, of Newcastle-on-Tyne.

Extensive alterations and additions have recently been made to Freshfield Roman Catholic training college, near Southport, for the Superiors. Mr. Frederick H. Peate, of Liverpool, was the architect, and Mr. Samuel Thomas, builder, of Goreslane, Formby, has carried out the work.

The foundation-stone of the new Priory in connection with St. Dominic's Church, Red Barns, Newcastle-on-Tyne, was laid on Saturday. The new Priory, which will be of Gothic character, has been designed by Messrs. Dunn and Hansom, of Newcastle, and will be built of red brick with terracotta dressings. When completed, the Priory will cost somewhere about £7,000 or £8,000. The section just commenced will cost about £3,300.

New warehouses have just been built in Farringdon-road, to which they have a frontage of 120ft. Mr. F. J. Chambers was the architect, and Messrs. Grove and Son, of New North-road, N., the builders.

COMPETITIONS.

HELSTON PUBLIC ROOMS.—This competition, to which reference was made in our columns, has recently been decided. From the designs submitted, six were set apart by the committee specially appointed to examine and report upon the plans. The committee unanimously advised the adoption of the design bearing the motto, "St. Michael." Upon opening the sealed envelope, the successful competitor proved to be Mr. Charles E. Dyer, of Plymouth, who has been instructed to proceed with the work. The building will occupy a central position in Wendron-street, upon a site a part of which is occupied by the Old Grammar School. This building is a substantial structure, and possesses far more merit as an architectural composition than most buildings of its period. On these grounds, and upon the score of economy, it has been thought advisable to retain and embody in the new building the more important portions of the old one. The buildings will comprise a reading-room and library, business and committee-rooms, billiard and smoking-rooms, rooms for the caretaker, and a large hall with suitable retiring-rooms. In view of the deplorable sacrifice of life at Exeter, which has caused so great a sensation throughout the kingdom, we are glad to note that the architect pointed out in his report to the committee the effectual means he had adopted for escape from the building in case of actual fire or panic. We hope to be able shortly to illustrate the design.

HOPE CHAPEL, WIGAN.—The building committee having recently advertised for designs for a new chapel, to be erected near the Market-square, received about a dozen designs from various architects, and ultimately selected the one submitted by Mr. George Heaton, of Wigan, member of the Society of Architects, and Assoc. Mem.Inst.C.E., as being entitled to the premium offered—viz., fifteen guineas. The cost of the building will be about £3,000.

CHIPS.

St. Andrew's Church, Eccles (erected in 1879 at a cost of some £8,000), is about to be completed by the addition of a tower—designed by Mr. Crowther, of Manchester—the cost of which is borne by contributions from the late Mr. Henry Boddington and his family.

A meeting has been held at the Castle of Chillon for preparing the restoration of the castle and the establishment there of a national historical museum.

During the Marquis of Bute's recent stay at Cardiff Castle workmen were employed under his superintendence in excavating near the ruins of the Black Friars' Priory, in Cathay Park; the remaining walls have of late years been used as a vinery, but this is now to be removed and care taken to preserve the ruins. During Lord Bute's absence from Cardiff orders are given to suspend the excavations by which the ground plan is being ascertained, as he proposes to personally direct the work.

The inhabitants of Milton of Campsie have been presented by Mr. Alexander Macnab with a new public hall. Designed by Mr. William Marshall, Kirkintilloch, the hall is a one-story building, lighted from the roof, with ante-rooms and janitor's house, and is seated for about 400 persons.

Major Tulloch held an enquiry at Middlewich, on Saturday, respecting a loan of £450 for sewerage work. The engineer submitted plans for a siphon sewer, the ends of which were on a dead level, explaining that the local authority had instructed him, but he did not believe it would work. Major Tulloch said it was most amusing that the board should instruct the engineer, and not vice versâ. He condemned the siphon sewer, and approved the rest of the scheme.

The re-opening of the parish church of Billingborough, Lincolnshire, took place on Wednesday week. The work of restoration has been carried out by Mr. Dickinson, of Billingborough. The nave has been re-seated, the passages have been paved, having borders of encaustic tiles, the walls have been re-plastered, and a new door on the north side has been opened out.

A new iron girder bridge erected across the Leven at Balloch, N.B., in place of a suspension bridge, which was condemned, is now open. It is 25ft. wide, giving one footpath and a roadway sufficient for two vehicles to pass. The bridge is in five spans, and has cost about £5,000.

Mr. David Oldfield, late of London, has been elected as surveyor to the newly-formed local board for Felixstowe and Walton, Suffolk.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

"BUILDING NEWS" DESIGNING CLUB.

E. AYE WILLIAMS, F. W. Chapman, W. Ellison Fenwicke, J. Reade, R. Readhead, F. Carpenter, S. Short, and several others:—The rules for the series of competitions for 1887-8 in connection with the BUILDING NEWS Designing Club will be published in the course of a few weeks, when the awards now pending will be made. Correspondents are requested to note the answers given in last week's issue to other similar inquiries. We cannot undertake to reply by letter to the very large number of communications received from all parts in reference to the club. All subscribers are welcome as members on their written application, giving their age, address, and occupation, as required by our rules.

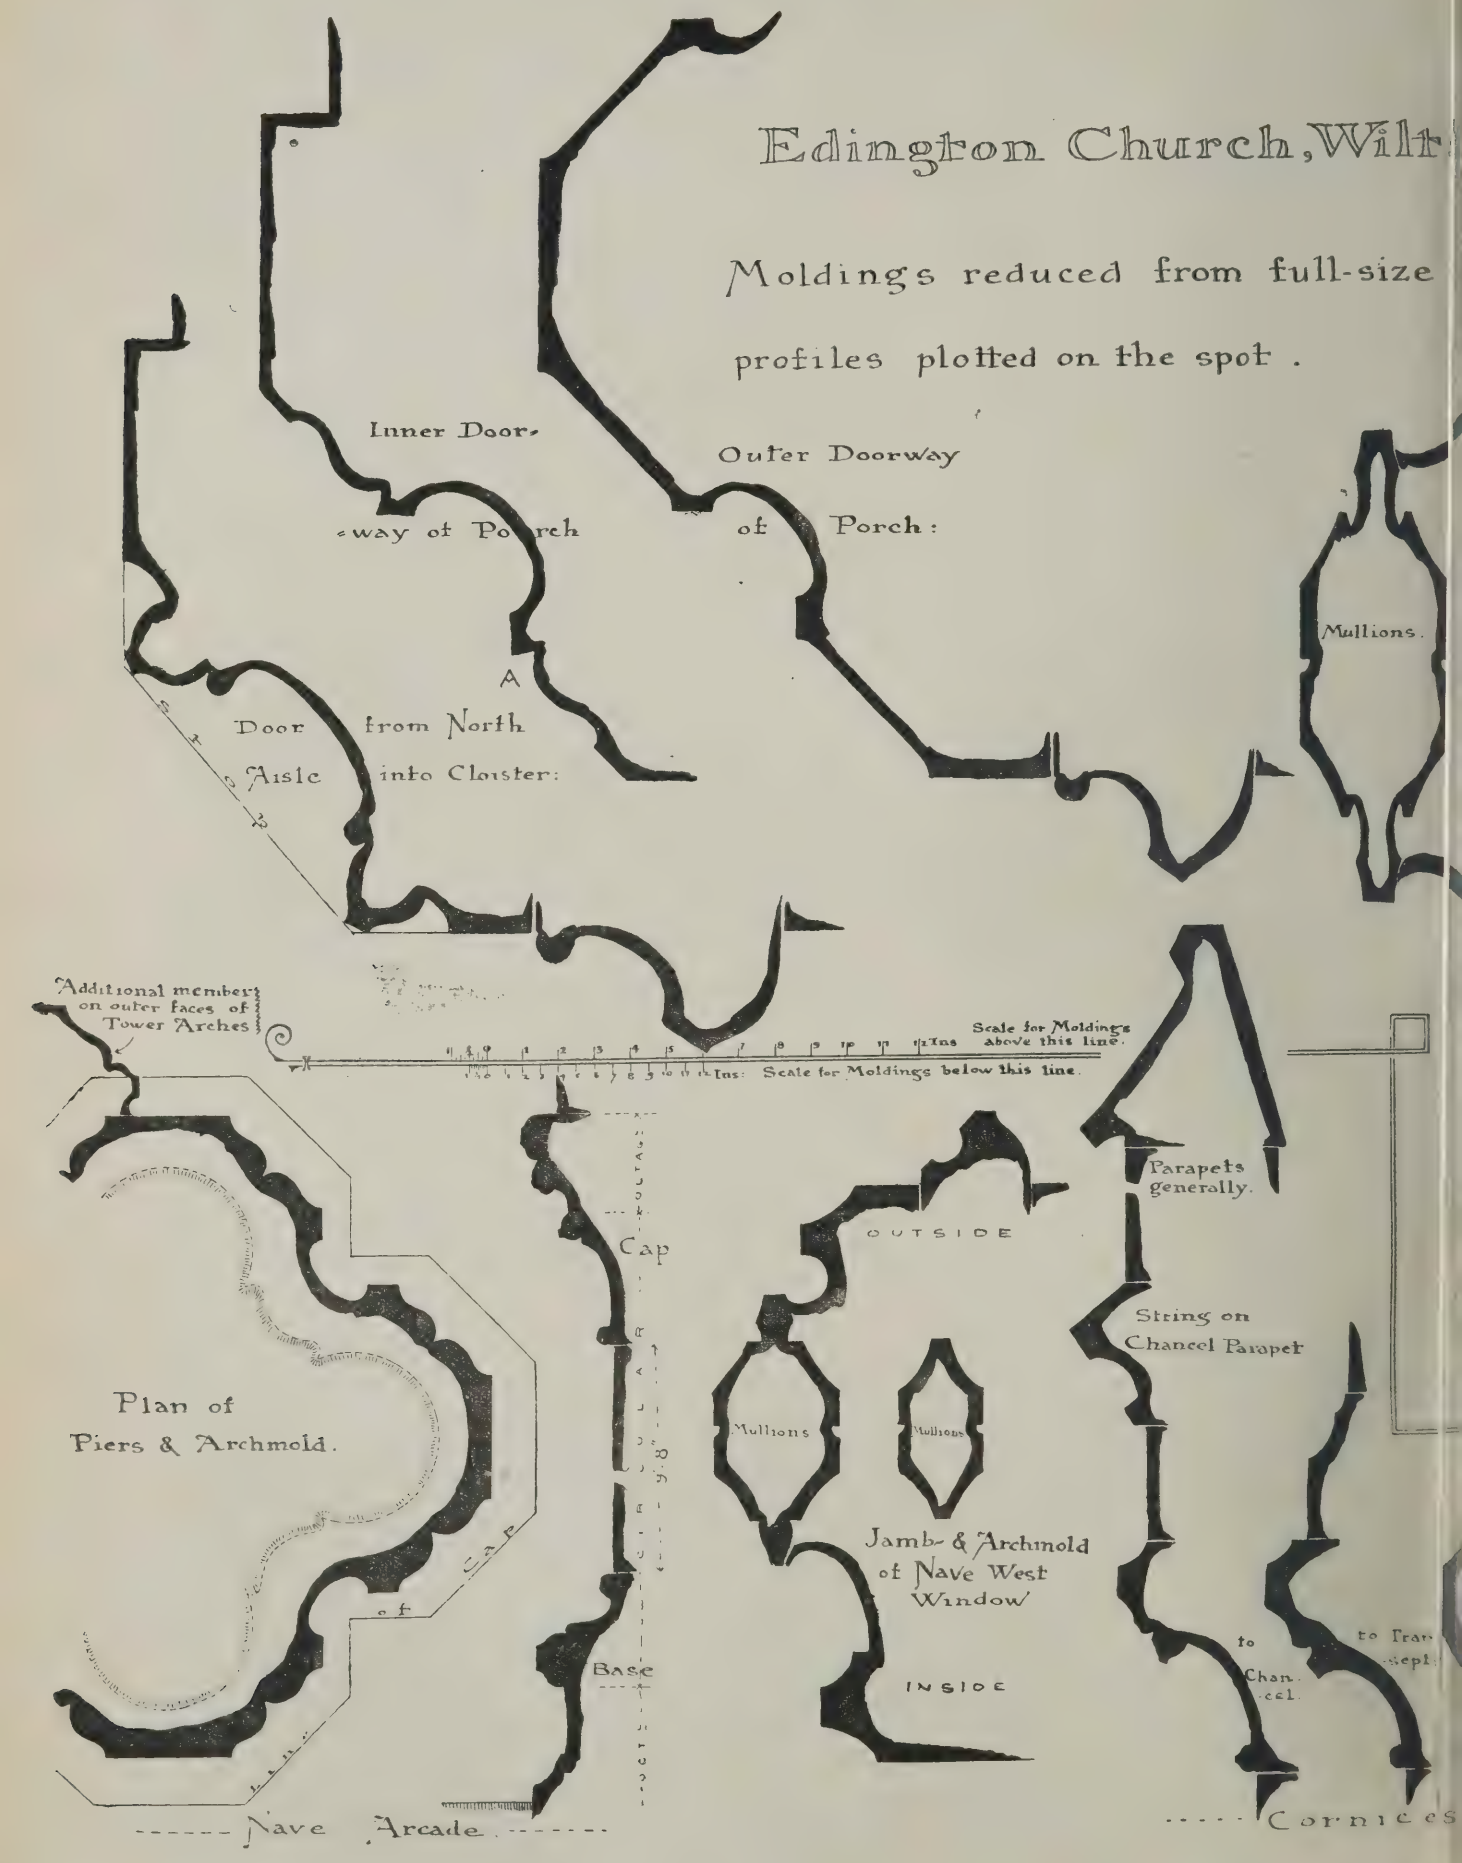
Correspondence.

ARCHITECT AND BUILDER.

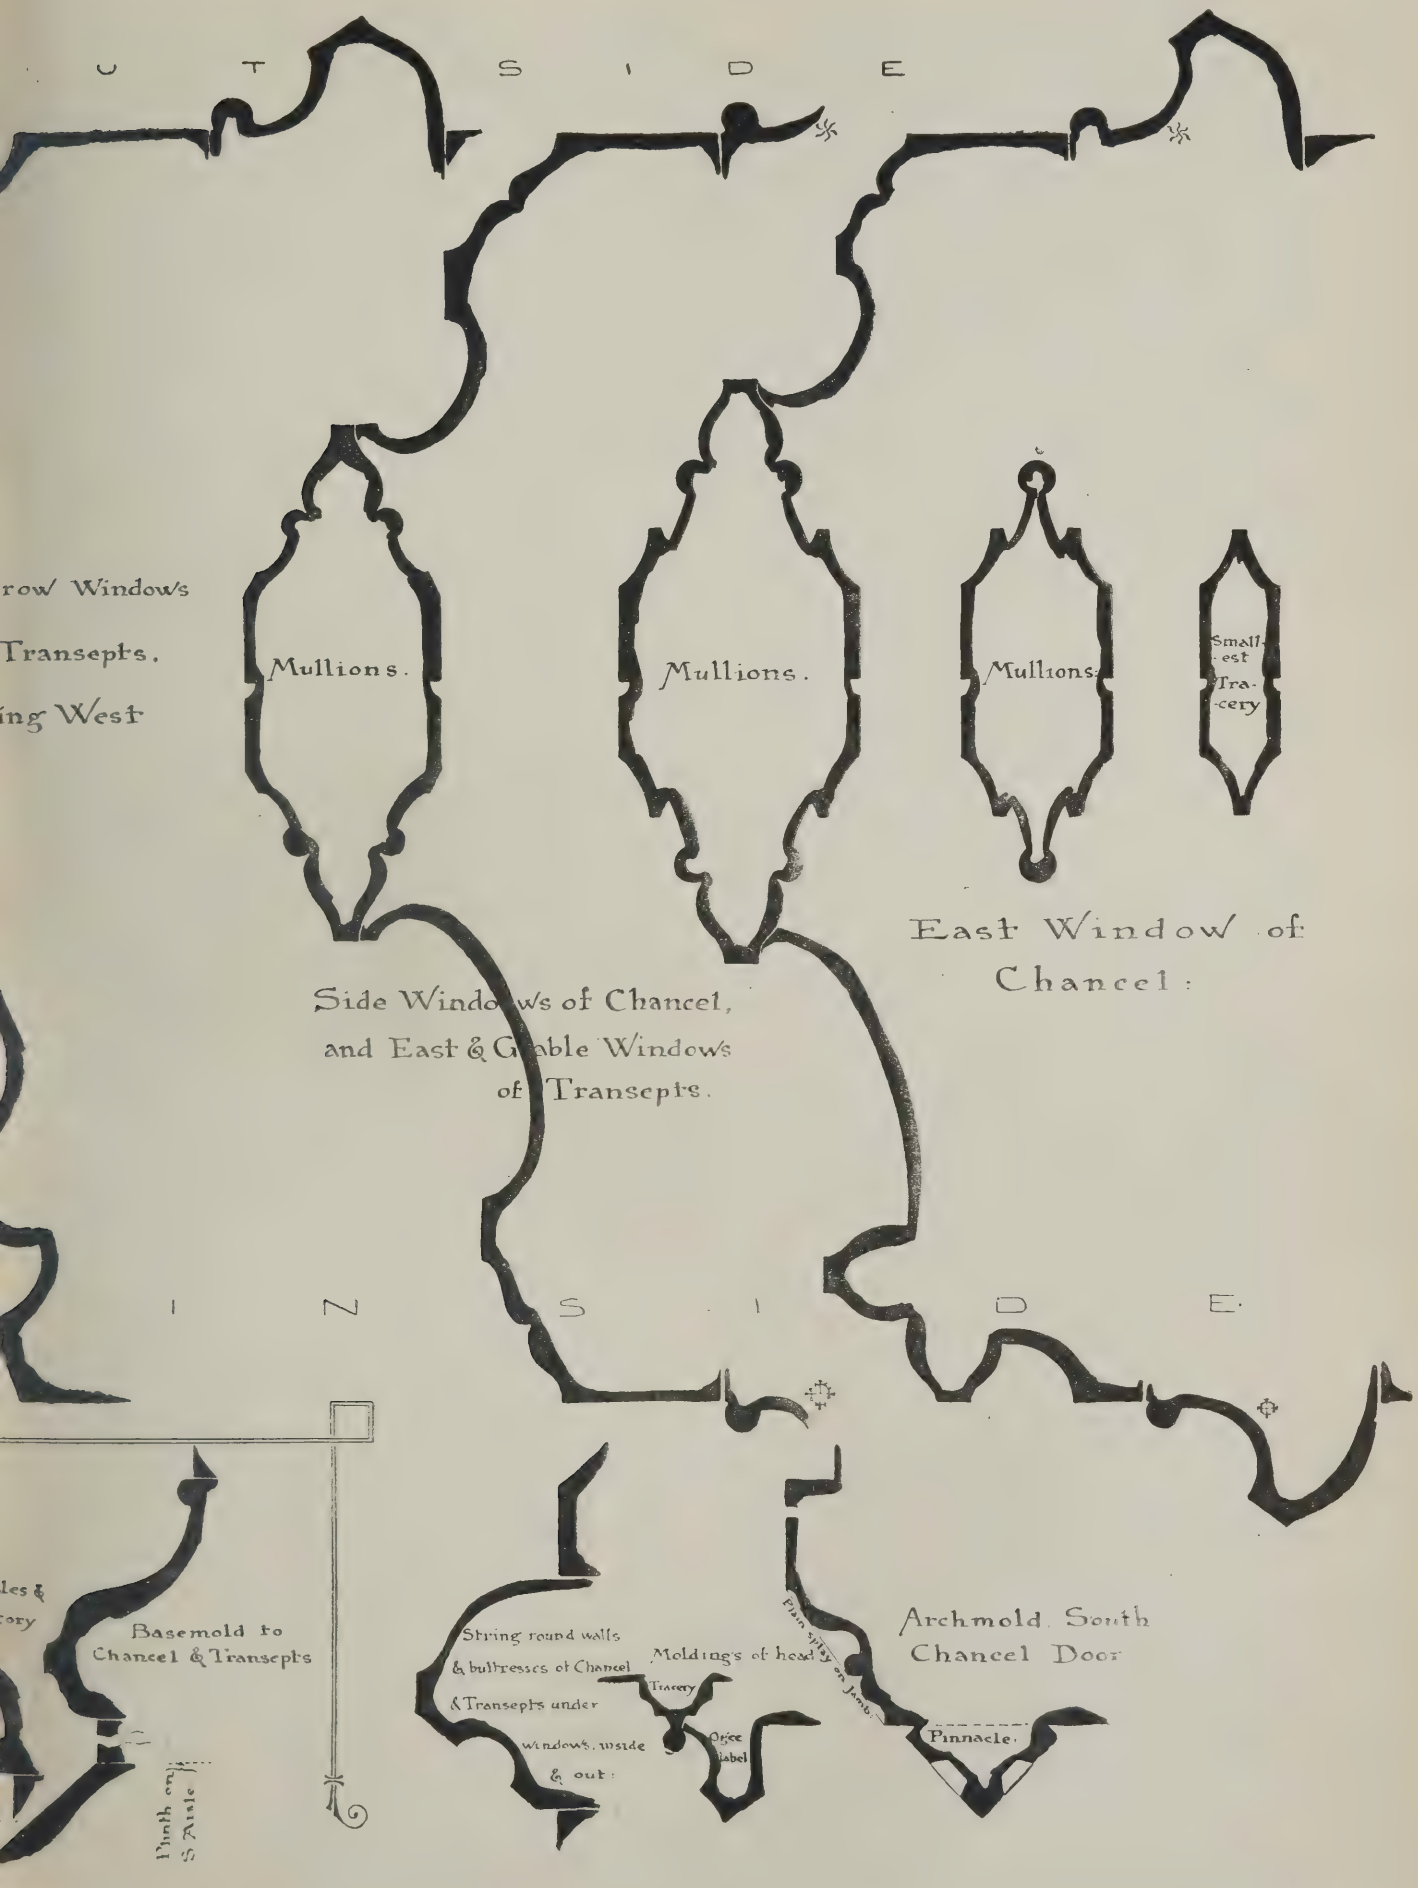
To the Editor of the BUILDING NEWS.

SIR,—The article in last week's number on the relations of the architect and the builder is rather suggestive than conclusive; like building contracts from which the old-fashioned provision that the architect's decision shall be final and conclusive, has been omitted for the new-fangled clause for arbitration, which frequently suggests litigation.

It is not easy to see from what you have said in your opening paragraph, the strong grounds for affirming that the architect in his present capacity (*per se*, or what it is at present supposed to be), between client and contractor holds a threefold relation of artist (which he frequently is not), agent (which he only could be by the express or tacit consent of the client), and arbitrator (which he only could be by a clause in the contract).



As to the part of the architect's capacity containing the two last you ask the questions, "Can the architect bind the building owner or his principal by any act?" "Are his decisions to be taken as conclusive and final?" Which you do not answer. May I do it for you? First, he cannot bind his client in anything for which the client has not given him authority to do so; of course the authority can be given in many ways, written or oral, or by tacit approval, or by clause in the contract as to ordering works, or giving certificates; but it is absurd to suppose that an architect has an inherent right to bind his client or employer. Then as to his decisions being final and conclusive, it entirely depends on the terms of the contract by which his decisions may be made so, as to the true intent and meaning of the drawings and specification; what are and what are not extra works, and omissions, their value, and the authority for them; the time for executing the works, and any extension of it; the enforcement or waving of penalties and their amount; the necessity for annulling the contract, and for employing other means for completing the works, and the deduction for same; the time and amount of certificates for instalments, and of the final certificate of the completion of the works. As to these, and others, such as the use of proper materials and employing proper workmen, &c., the contract can provide that the architect's decision shall be final and conclusive as to all or any of them; but such a provision is inconsistent with a general clause for arbitration; yet such a clause may also apply to all, or be limited to any of them.



Lord Grimthorpe's clauses were unnecessary, except to prevent misconception of an existing fact, for neither architect nor clerk of works has power to bind his employer unless he has given him the power to do so. No doubt it may be inferred that he has done so by approving of the plans and telling the architect to proceed to carry them out, as regards the usual steps taken in similar cases, which may include ordering quantities, as you say; but even this is doubtful, if the architect has not mentioned, as he should do, to his client the necessity for it, and cost of it. Not doing it may enable a smart young man, or a slow old one, to pin his client to a commission; but candour, as well as honesty, is the best policy in the long run.

As to remedying defects discovered after the final certificate, this is usually provided for by a clause in the contract withholding payment of the drawback or percentage deducted from the instalments paid during the progress of the works for some time after their completion, during which time the contractor would be bound to remedy defective work; but even after this time had expired, and all money had been paid, the contractor would be bound to make good any fraudulent or dishonest work, notwithstanding the final certificate of the architect, who would be otherwise accountable to his client for giving it, if he did not exercise due diligence or skill, or was influenced by collusion or other improper motive.

The clause of exceptional power which you quote as to "extras," beginning with, "In case the architect shall consider it desirable to order additional work," and ending with, "included in the specifications and drawings," would be absurd or monstrously unjust without the usual termination, "except as to the money value of such works according to the schedule of prices, and as shall be certified by the architect," for without this the literal meaning of it as quoted would be that the architect could order any quantity of additions or alterations to the contract without increasing the amount of it; but with the termination of the clauses to which you seem subsequently to refer, it only places the architect in the same position as to extra and contract works, which is certainly right.

The clause in the heads of conditions of the Institute of Architects clashes with Mr. Justice Grove's decision, for it refers to the very matters the Justice says the architect should not decide, as he should not be a judge in his own case; but the true intent and meaning of the drawings and specification, and any discrepancies between them, are just the matters the architect is personally interested in, although all agree that these are matters he should decide, if any. So that Justice Grove was misapplying the principle he enunciated, and your distinction between cases where "the employer, *or the architect* on his behalf," and "simply the employer" are concerned is not very clear; nor is the distinction between the cases in which he has the right to determine and those in which he has not. In fact, he has no right to determine anything *per se* that the

contractor cannot challenge. The right to decide must be conferred on him by the conditions of the contract, and, therefore, these conditions should be well and carefully considered, and the architect should see that they give him the necessary power to have his designs carried out faithfully and honestly; but he should claim no power that could only be used as a cloak for negligence, incompetence, or fraud.

A short time since a question was raised in the BUILDING NEWS as to the right of a client to see the contractor or builder's account, and opinions were expressed that he had no such right. Of course, the architect had no more right to retain the builder's account from his client (who was to pay it) if he demanded it, than he had to take the coat off the client's back, and the only valid reason for withholding it would be to prevent his accuracy or good faith being tested if the client had reason to doubt them, although some flimsy excuse was given as to exposing builders' prices.—I am, &c.,

Sept. 13. M. M.

THE EDINBURGH ANTIQUARIES.

SIR,—The BUILDING NEWS of the 2nd inst. has just reached me here, and I notice that it contains a letter from Mr. J. Romilly Allen which will show your readers what members of the Edinburgh Society think of themselves, and how they can speak of others who have no connection with the clique, but have spent years in the independent study of archæology in sequestered places where prehistoric remains abound. They affect a superiority which they have done nothing to support; and, although I am now classed by Mr. Allen amongst "conceited dabblers," I can produce testimonials as to my qualifications as an antiquarian discoverer even from the society itself, or at least from the official, who is, as we Scotch say, "the tongue of the trump," or in other words, from the manager. In 1877 I wrote a paper on the antiquities of St. Kilda, which the said official informed me he had read to a "large and interested audience," and which was subsequently published in the society's "Proceedings." He was also good enough to say that it was "excellent alike in matter and in manner." In 1882-3 I spent nearly a year in Tiree, where I was assured by the official alluded to I would find nothing that had not been already seen and described by Mr. Muir and Dr. Reeves.

I, however, found innumerable prehistoric remains of the most interesting character, which these gentlemen (whose attention had during their brief visit been confined to ecclesiology) had never observed. I was the first to penetrate into the prehistoric ages there. I have withal resided for four years in Shetland, have opened many prehistoric cairns and graves, and examined and ascertained the purpose of extensive remains of pagan worship—remains which are to be found in every part of the group, which are well known to, although their character had never been suspected by, the natives, and of whose existence the Edinburgh antiquaries are perfectly ignorant. After such a long and dearly-bought experience, you will, perhaps, allow that I ought to be as competent to clear out and examine the contents of the so-called Pictish brochs as any man in Scotland. I have at all events no hesitation in saying that the information regarding these ancient buildings on which members of the Edinburgh Society erect such elaborate theories is utterly unreliable. In Vol. V. of the "Archæologia Scotiæ" a list of brochs is given, which includes some ruins in this district that I know to a certainty are not brochs, and have no resemblance to brochs. In Shetland all ancient structures, and even shapeless heaps of stones, are vulgarly called "brochs," and you can imagine what confusion the relics and information sent to the Edinburgh Society by these indiscriminating people must occasion.

I agree with Mr. Allen in thinking that "it is far better that the Pictish towers of Shetland should remain buried for a century to come, than that they should be explored by persons wholly unfitted for the task"—such, I may add, as the S.S.A. receives its information from. The simple reader may imagine that to choose a lord for a president is a judicious arrangement, as the Society will at least be taught good manners; but the more astute will have noticed that those who come in contact with the nobility without being of it, such as valets, gillies, and gamekeepers, are generally more insolent than those who associate only with their equals.—I am, &c., J. SANDS.

FIRES IN THEATRES.

SIR,—Some years ago, after one of the theatre catastrophes, I wrote to the public journals explaining what I think is the only remedy in case of fire or panic—namely, open to the street stairs formed outside the main building and for each stairs to finish on the street level, and to have no doorway or any part of it connected with the building, because such doorway, if fire was issuing, would prevent the people from coming down.

If this system was carried out, I believe it would be a cure of these sad disasters of death by burning or panic, because fear to a great extent would cease as soon as the people found themselves clear of the building and in the open air. These staircases could be easily designed, for safety with short flights and recesses, for the weak to stand aside in case of panic.

The harrowing details of death in the tortuous staircase leading down from the gallery of Exeter Theatre could not have occurred if formed on the above lines. Staircases formed inside public buildings are suffocating flues when fire occurs. Iron screens and automatic fire extinguishers are very good; but how often do we find that such when most wanted are out of order?

The safety of the people should be the first consideration, and this can be only effectually dealt with by forming all staircases outside of the main walls of public buildings.—I am, &c.,

Crichel, Wimborne. W. T. CHINCHEN.

SIR,—We read Exeter Theatre was a roaring furnace in three minutes, and the flames lit the country for miles; and that it was constructed with all the latest improvements. It does not appear that much was done to make it fireproof, for there seems to have been much wood used in its building to create so much flame and such a terrible disaster. Perhaps an experienced local man will kindly enlighten us as to what materials were the flooring, roof, girders, columns, window frames, dado, doors, ceilings, staircases, &c. As I suppose no such account has appeared, many of your readers will, I think, feel interested and obliged, including myself. —I am, &c.,

Broxbourne, Sept. 13th. JAS. PULHAM.

SIR,—Will you allow me a space in your paper to suggest a possible means of making the exits from galleries of theatres easier than now—i.e., instead of the usual stone steps or stairs, it might be a zig-zag inclined plane, the same as is used for going down a subway under a roadway—the floor to be laid with tiles and joints, giving good foothold. There would not be anything like the risk of falling on this, and people could run along it as fast as they liked. It would, of course, occupy more space: but something must be sacrificed to try to prevent such another fearful loss of life as that which has unfortunately happened at Exeter.

I submit that this plan would have the advantage of being easier for going into the theatre, as well as getting out in time of panic, and obviating the difficulty always existing now on stairs, i.e., treading on ladies' dresses when people are moving in crowds, and which is one of the dangers and annoyances of leaving a theatre at any ordinary time.—I am, &c.,

Sept. 13. C. C.

The managers of St. Mary's School, Windermere, have adopted plans for a new boys' school, prepared by Mr. R. Walker, architect, and have given him instructions to prepare the drawings required by the Education Department as soon as possible.

Messrs. Young and Williams, the sub-contractors for the Inverkeithing tunnel on the Forth Bridge Railway, commenced work on Wednesday.

The Government of New South Wales are inviting designs for the erection of a Centennial State House. The competition is only open to architects in the colony, and two prizes, one of £150 and one of £100, are offered for the two best designs. The cost of the building is not to exceed £150,000, and the style is to be Corinthian.

The tower of Lymm parish church, partially restored in 1885, is about to be strengthened and repaired from plans by Mr. J. S. Crowther, of Manchester, at an estimated cost of £100.

Intercommunication.

QUESTIONS.

[9394.]—**Surveyor's Pupil.**—Will any of your readers be good enough to inform me as to the best course of study and plan of action from the beginning for a quantity surveyor's pupil, and the best and cheapest books? Although I referred back to past numbers of the "B. N.," I can find no such information, excepting that for architectural students, which does not apply. The question may be of interest to others beside me.—E. MASEY.

[9395.]—**Discoloured Parchment.**—I shall be much obliged if some kind correspondent will assist me to restore the colour of a parchment certificate, which has become discoloured by smoke?—TYRONE.

[9396.]—**Heating School.**—I am about to build a school having large room 50×20 and classroom 25×18, with master's room in. I want a simple method of heating by hot-water; the pipes must not run along the floor, nor do I want them sunk in trenches, which form dust-traps, &c. There is a system mentioned in Robson's book on "School Building and Prices." Will someone kindly tell me whether this is likely to suit my purpose?—NORTHERN LIGHT.

[9397.]—**Exam. for Assistant Surveyor, Civil Service.**—Will anyone who has sat for the above give me a specimen of the questions put; or can any of the past exam. papers be had? Also how long the exam. lasts?—A CANDIDATE.

[9398.]—**Building Stones.**—I should like to be informed from what quarries the stone was obtained for Wells Cathedral, as it is in a fair state of preservation exteriorly. The stone is reputed to have come from Doulting (Old Down). It is a shelly limestone, uniform in texture. Glastonbury Abbey is said to be from the same quarry, and if so there is a good guarantee of its durability. Salisbury, I believe, is built with Tisbury stone from Wiltshire.—ENQUIRER.

REPLIES.

[9310.]—**Half-Timbered Work.**—I am much obliged to "G. H. G." for the sketch he gives, and for the lucid explanation; but will he refer to p. 346, and note that I invited a "full illustration" of the mode of framing the timbers and their connection with the inner wall, &c.? And will he explain the nature and use of the projection shown at the back of the stud upon his sketch? Also where he would put the plaster and pebble-dash he recommends; he has omitted to show it.—JAMES THORNELOE.

[9385.]—**Strong Room.**—It is usual to ventilate and light strong rooms, and sometimes by means of gas lamps, which are perfectly safe from fire. "Doubtful" does not give sufficient information to enable any one to advise him, and if he would describe the situation of the room, size and construction of walls and ceilings, and if lined with steel and fireproof, also the class of door and ventilating gate intended to be used, then some advice can be sent to "Doubtful" through your pages by one who has had considerable experience in connection with strong-rooms.—CLERK OF WORKS.

[9387.]—**Civil Engineers.**—It is usual for a young man to be articled, though not absolutely required. There would not be any great difficulty in getting employment as an engineer's assistant without serving an apprenticeship, if the applicant is a fair draughtsman and knows something of the business. Many young men have done so and worked their way up. There is a good deal to learn—a knowledge of mechanics or applied mathematics is absolutely necessary to insure any success, construction in brick and iron, hydraulics, sewering, water supply, and other subjects required under the provisions of the Public Health Act are necessary.—G. H. G.

[9388.]—**Book-Keeping.**—Obtain the books published by Messrs. Hudson and Kearns, Southwark-street, who, I believe, have published a set of such books for architects' use.—G. H. G.

[9389.]—**Height of Shaft.**—If in an exposed situation, I should say a height of three diameters for a shaft of the size you mention would be as high as you could safely go.—G. H. G.

[9390.]—**Perspective.**—Refer to back numbers of the "B. N.," where several replies for setting the centrolinead are given.—DRAUGHTSMAN.

[9391.]—**Architects' Chances at Buenos Ayres.**—According to the interesting lecture of Mr. Frank E. Thicke, of Buenos Ayres, published in the BUILDING NEWS of the 2nd inst., pp. 353-5, an English architect of any ability and go ought to have fair prospects in settling in that city, as the population is increasing very rapidly. Money seems plentiful, and there is a movement in progress for rebuilding on wider lines and with loftier houses the crowded business centre of the city. I should advise "Ignoramus" to write to Mr. Thicke for further information.—E.

[9393.]—**Salisbury.**—I never was above the base of the entirely windowless spire; but from its colour and external state never doubted it to be of the Chilmark stone. The four legs (each nearly concealed by its twenty decorative shafts bearing nothing) are of the same Purbeck shell-marble, but on its bed, as is the middle shaft of the chapter-house. But the six bearing more than half the Lady-chapel vaulting, four single and two clustered, have the bed upright. Price observed, in 1774: The difference of sinking between the N.E. tower-leg and the S.W. does not account for a fourth of the decline, this being mainly in the upper parts of the spire, which settled in a curve and might doubtless be straightened (as Manchester chimneys have been) by drilling holes round half of some of the beds of mortar.—E. L. G.

The burghs of Falkirk, Denny, and Dunipace are about to carry out a combination scheme for a supply of water from Faughland Burn. The estimated cost is £50,000.

STATUES, MEMORIALS, &c.

ASHTON-UNDER-LYNE. — A bronze statue, which has been erected by public subscription to the memory of the late Mr. Hugh Mason, M.P. for Ashton-under-Lyne from 1880 to 1885, was on Saturday publicly unveiled at Ashton. The sculptor is Mr. J. W. Swynnerton. The figure is 8ft. high, and represents Mr. Mason in the attitude of addressing a meeting, with arms folded, the right foot a little advanced and the face slightly turned to the right. The statue stands upon a grey granite pedestal 11ft. 6in. high, surrounded by a railing. Its position in Chester-square, looking up the long straight line of the principal street, is commanding.

FROME.—As a memorial to the late vicar of Frome, the Rev. W. J. E. Bennett, it was decided to restore and beautify the cross erected by him in the churchyard, and which had fallen into a very bad state of repair. Mr. W. V. Gough, of Bristol, has prepared plans, which have been approved by the committee, at an estimated cost of about £450. The scheme provides for the re-erection of the present cross on a base of five octagonal steps, with new steps leading from the entrance to the upper path of the churchyard, all of these to be of red Mansfield stone. Round the cross and bounding the steps on each side will be a traceried balustrade of Doulting stone with carved angels on the newels. The whole of the space within the balustrade will be laid with Roman mosaic in ornamental patterns, having Mr. Bennett's monogram introduced into the design. The carving will be executed by Mr. H. T. Margetson, of London. The estimate of Mr. F. P. Brown, of Pilly-vale, Frome, has been accepted, and the work will be proceeded with at once.

CHIPS.

At Guy's Hospital on Wednesday, an inquest was held on Robert Hicks, 31, of Ladd's-court, Bankside, a scaffold builder. William Shepherd, the son of the builder, Mr. W. Shepherd, of Bermondsey New-road, said he saw the deceased, who was taking down scaffolding, jump from the parapet on to some planks 3ft. 6in. below. The deceased fell through one of the boards, which snapped in several pieces and fell with the deceased. The board was quite strong enough for the ordinary work done upon it. The cause of the plank snapping was the deceased jumping upon it. The plank, broken in several pieces, was produced, and the witness admitted it was defective. A juryman, a builder, declared the wood was rotten, and ought to have been cut up for firewood. Another juryman said it was shameful to have allowed such a board to be in use at the top of a building. A scaffolder named Walker said he was bound to admit the plank was a very bad one, and such as no scaffold-maker ought to put in. The jury returned a verdict of "Accidental death," with a rider that there was negligence, not amounting to criminal negligence, on the part of the builder, in allowing such a board to be used, and which had contributed to the death of the deceased.

The autumn meeting of the Iron and Steel Institute was commenced at Manchester on Wednesday, under the presidency of Mr. Daniel Adamson, who in his address pointed out the necessity of a considerable improvement in trade before it could become reasonably remunerative to capitalists and to owners of works.

The corner stone of the Roman Catholic Church of St. Etheldred, at Leominster, was blessed on Tuesday week. The church will cost about £1,300. The contractors are Messrs. J. Jones and Son, Sedgley, and the architects Messrs. Pugin and Pugin, of London; the clerk of the works is Mr. J. Patchett. The church is in the Late Decorated style, and consists of nave and chancel, with a chantry chapel, sacristy, and confessional. The building is divided into seven bays. The total length is 70ft., and the width 26ft. The materials are local bricks, with facings and dressings of Bromsgrove stone.

Mr. William Nelson, head of the publishing firm of Thos. Nelson and Son, died at his residence in Edinburgh on Saturday, aged 71. He had recently restored St. Margaret's Chapel and the Argyle Tower, in Edinburgh Castle, while at his expense workmen are now engaged in restoring Old Parliament Hall, from plans by and under the superintendence of Mr. Hippolyte J. Blanc, of that city.

The town council of Halifax were presented on Wednesday week by Mr. Joseph Pickard, a local manufacturer, with a collection of oil paintings by Rembrandt, Raphael, Le Brun, Correggio, Bassano, and others; also a quantity of old prints after the Dutch masters, and a number of chromos and water-colours, all in frames. The donor expressed a wish that the collection, numbering 150 to 200, should be hung in the Bank Field Mansion, Akroyd Park. The gift was cordially accepted on the condition named.

LEGAL INTELLIGENCE.

SMOKE PREVENTION. — At Lambeth Police-court on Friday Sir Henry Doulton appeared in answer to an adjourned summons, in which he was alleged to have infringed the Smoke Nuisance Act in having negligently used a certain furnace upon his premises so that the smoke arising therefrom was not effectually consumed. Mr. Poland again appeared for the prosecution, and Sir Henry Doulton conducted his own case. Mr. Poland now said that the chimney-shaft at the defendant's premises had been watched by the police, and upon only one occasion was smoke noticed issuing for 10 minutes. He now suggested that the matter should stand over *sine die*, and if there was no further nuisance the case would be allowed to drop. If there were, fresh summonses would be taken out. Mr. Biron said he had no doubt the defendant had used every effort to prevent the nuisance; but it must be prevented, for what a great man might do a little one might follow. Mr. Poland had said the defendant had done all he could in trying to remedy this evil, and he fully believed it was so. The defendant said for 35 years he had constantly paid attention to the subject, and brought about at large expense many great improvements. He had still great anxiety in the matter, and should do his utmost to bring forward every possible improvement. Mr. Biron thought the assurance given by Sir Henry was quite sufficient, and it was agreed that the summons should be adjourned *sine die*.

IN RE STEWART BROTHERS.—Court of Bankruptcy, Sept. 7th (before the Official Receiver).—Mr. C. F. Kemp, the trustee under the bankruptcy of Messrs. Stewart Bros., of Fen-court, City, and New Brunswick, Canada, presided at a meeting of creditors convened to consider a scheme of arrangement proposed by the bankrupts. The failure occurred some months since, and the accounts as amended showed joint liabilties expected to rank £158,102, and assets £19,977. The scheme provided for the vesting of the estate, with the exception of the debtors' interest in the Ottawa property, Canada, in the trustee, to be administered for the benefit of the creditors; the debtors to tranfer their interest in the Ottawa property, subject to claims, with a view to the payment of £70,000 in six years to the trustee out of the balance of net profits, for administration under the scheme. The scheme was not favourably received, and Mr. Hawes, in deference to the feelings of the creditors, withdrew it.

PARLIAMENTARY NOTES.

THE TOWER GARDENS.—Mr. E. Stanhope informed Mr. Fisher on Tuesday that her Majesty had approved of the opening, as an experiment, of the gardens and the covered way of the Tower of London, under rules now being framed.

THE LONDON THEATRES.—The Home Secretary, in reply to Major Rasch, has stated that the report of Captain Shaw on the London Theatres was confidential. He would consult with the Lord Chamberlain and the Metropolitan Board of Works as to whether it could be published to the public advantage.

The Directors of the Small Farm and Labourers Land Company, of which Lord Wantage is chairman, have decided to build several cottages on the Cottenham and Histon estate in Cambridgeshire, in consequence of a demand for the same among labourers and others. The company's surveyors, Messrs. Bidwell, of Ely, are at present engaged in preparing plans and obtaining tenders for the erection of suitable cottage dwellings, to which plots of two or three acres will be attached.

A new Roman Catholic School chapel at Tilbury was opened on Thursday, the 9th inst. The site is two acres in extent, and on it, in addition to the present building, it is intended to erect a girls' school, a church, and a presbytery. The structure now raised provides accommodation for the education of 250 children, the large school room being utilised as a school-chapel. The work has cost £1,300.

Mr. Henry Patteson, of Manchester, senior partner in the firm of J. and H. Patteson, marble masons, of Oxford-street in that city, died at the age of 52 on Wednesday week at his residence at Rusholme. He was a magistrate and alderman of that borough, served as Mayor in 1879-80, and was one of the chief promoters and supporters of the Thirlmere water supply scheme now in course of execution.

One of our engineering contemporaries mentions that for some time past specially prepared slag has been used in Germany for the metalling of roads, principally in the neighbourhood of Hanover. Some of the furnaces in the Hanover district make a speciality of a metalling material called slag stone which is hard and crystalline in character, and is considered very suitable for paving purposes.

Our Office Table.

THE syllabus of lectures of the City of London College, White-street, Finsbury, of which the fortieth session will commence on Monday, October 3rd, has just been issued. The lectures in the engineering department, which is conducted by Professor Henry Adams, M.Inst.C.E., M.S.A., assisted by Messrs. R. J. Hatton and S. F. Howlett, treat upon the subjects of technical drawing, building construction, machine construction, and drawing office practice; the classes are all in connection with the Science and Art Department, and the fees are very low so as to enable artisans to avail themselves of the privileges afforded by the college. Numerous studentships, scholarships, and prizes are offered to students. The valuable textbooks on constructional subjects written by Mr. Adams afford evidence that the instruction given in these classes is practical and thorough, and further proof is given in the fact that during the past twelve years the students under Mr. Adams have taken at the May Science Examinations two Whitworth Scholarships, £100 per annum; one Queen's silver medal, one bronze medal, 25 places in honours, 149 Queen's prizes, 225 first-class certificates, and 286 second-class certificates. They have also obtained in the Examination of Drawings:—National Competition, one bronze medal; 38 third grade prizes, 64 second grade prizes, and 214 awards equivalent to honourable mention. They have gained in addition, a large number of college and special prizes and certificates.

MR. J. E. WAKEFIELD, the clerk to the Metropolitan Board of Works, has written to the daily press to explain that the recent action of the Metropolitan Board of Works in reference to St. Mary-le-Strand was not taken with a view to the removal of the church, but simply to the prevention of danger to the public from any insecure portions of the structure, under the provisions of the Metropolitan Building Acts, 1855 and 1869. It was represented to the Board by the district surveyor that part of the church was in a dangerous state, some of the cornice having fallen, and the necessary notice was thereupon given to the rector and churchwardens. The matter is, therefore, he explains, entirely in the hands of those authorities, and the Board will be quite satisfied if the fabric is made secure in any way that the responsible owners of it may think best. As Mr. A. de Tatton Egerton explained in the House of Commons on Monday night, the removal of the church has only been considered in a general manner by the Board in connection with various schemes for widening the Strand and forming a new communication with Holborn. Mr. William Butterfield complains that under a general and easy-going notice from the Metropolitan Board, the whole upper part which forms the outline of the church, has been wrecked for want of careful and thoughtful intelligence, adding, "Much less money than has been ridiculously spent by the parishioners, since they were served with the notice by the Metropolitan Board of Works, would have repaired everything and left the church a beautiful object."

SOME correspondence has appeared in recent issues of the *West Briton* between subscribers to the new cathedral at Truro and Mr. Robert Swain, the clerk of works, as to the rate of progress and cost of the undertaking. "A Subscriber" asserts that the original estimate of Mr. J. L. Pearson, R.A., for completing his design as accepted in the competition was £95,000, exclusive of outlay on site, western towers, upper part of central tower and baptistery, for which another £25,000 was allowed in the architect's report. Of this sum £35,000 was allowed for the choir and its aisles, and £20,000 for the transepts and crossing up to the level of the ridge. At the date of the last report, presented on Oct. 9th, 1886, £94,016 had already been expended. No figures are, he says, available for the present year; but the writer declares that as only the choir and transepts, or one-third the whole edifice, have been built, the architect's estimate must be doubled if the cathedral is to be finished at a *pro rata* cost to that already incurred. Mr. Swain has replied, pointing out that, instead of one-third, more nearly one-half the scheme has been carried out; to

which "A Subscriber" rejoins that of the nave, which is to be 40ft. longer than the choir, only one stone—a memorial one—has yet been laid; that the upper stages of the central tower and its spire are not yet built, nor are the western towers, chapter house, and cloisters commenced, while much carving remains to be done in the section already erected. A sore point with "A Subscriber," on which he chafes again and again, is that, as he alleges, the contract was let by Mr. Pearson without competition on a schedule of prices for various works, and he challenges the committee to publish the official schedule of prices, that it may be seen whether it is, as had been rumoured, considerably above the market rates. To this Mr. Swain replies that if there exist two builders who would, as "A Subscriber" asserts, have taken the contract at prices from 25 to 100 per cent. below those of the present contractor, they may congratulate themselves, as they would in that case have been in the Bankruptcy Court. Further, as he remarks, such a work necessitates the use of special plant, machinery and plant which a local builder would be hardly likely to possess. Another correspondent raises the issue of the commission paid to the architect upon the outlay, remarking:—"I do not think the payment of 6½ per cent. can be professionally defended; 5 per cent. surely would pay him handsomely, and I have always understood *that* to be the maximum charge."

Two months ago a movement originating with Mr. E. Renard, Art Master of the Salt Schools, Shipley, was started for holding a competition open to all students of art schools and amateurs in Yorkshire, on similar lines to the Gilbert Competition in London. The executive decided to offer four equal first prizes and four equal second prizes for landscape in oil; landscape in water-colour; figure subject and black and white (and subject). The scheme was well supported, and competitors were asked to choose the mode in which the prizes should be adjudged, with the result that the scheme of suffrage adjudication was carried by six votes. The works for the art contest, 114 in number, have now been received, and are hung in the black and white room of the art section at the Saltaire Exhibition. Of the four sections exhibited, water-colour work ranks the highest. In the awarding of the prizes, competitors are supplied with voting papers, returnable on Sept. 30th; the competitor receiving the greatest number of votes being entitled to the first prize. The works are not signed, but are marked with a number by which the competitor may afterwards be identified. In connection with the scheme an Art Conference is to be held on Thursday, October the 6th, to discuss the extension of the scheme and the advisability of creating a professional and advanced section, the modification or development of the present rules, together with other matters of interest in relation to art in Yorkshire. The result of the experiment fully justifies the anticipations of the promoters, and it is believed that an annual exhibition may be made a factor for the development of art in Yorkshire, and bring to the surface many young artists of promise who might otherwise remain unknown and neglected.

A NOVELTY in builders' machinery is, according to the *Scotsman*, to be seen at work on buildings in course of erection at South Bruntsfield-place, Edinburgh. It consists of a derrick crane and a mortar mill, worked simultaneously by a single engine. The crane is elevated in the usual fashion upon timber scaffolding, at a considerable height above the engine, this being attached to an iron bogie waggon standing upon the ground. To lessen the liability of snapping, a wire rope is employed instead of the common link chain. This is led up from the winding barrel through a hole in the base of the crane, and thence over the top, across pulleys, for the purpose of hoisting the "jib." The turning or "slewing" gear consists of a perpendicular shaft, with cog-wheels horizontally attached, and made to work between the crane above and the engine below into similar wheels. The mortar-mill stands some distance from the engine, and is of the ordinary type, driven by a belt attached to a special barrel on the engine. Mr. John Oliver, builder, who is the originator of this duplex action, claims credit for having overcome the necessity for the employment of two engines, and in providing for the work to be done by one, he has reduced the cost of labour and fuel to a minimum, besides lessening the risk of accidents. Messrs. Carrick and Ritchie, engineers, are the makers.

IN a second letter to the *Times* on lightning conductors, Dr. Tyndall points out that the sums set apart by architects and builders for the erection of conductors are often totally inadequate to cover the cost of them. He suggests that the scant provision made may be one reason why the absolutely necessary terminal plates are frequently omitted, and the consequent failure to provide a safe earth connection.

ON Tuesday evening, the 6th inst., the artisans and others engaged on the work of extension and completion of the R.C. Church of the Sacred Heart, Norton-road, Hove, were, through the liberality of the Rev. S. A. Donnelly, entertained at a dinner at Mr. Lower's, Cliftonville Hotel, West Brighton Station. Sixty-five workmen put in their appearance, the chair being occupied by Mr. J. W. Randle, clerk of works; the vice-chairs being filled by Mr. C. Cole, builders' foreman, and Mr. L. D. Boulton, sculptor, of Cheltenham. The architect of the above works, which are near completion, is Mr. J. S. Hansom, F.R.I.B.A., Kensington, W.; and the contractors are Messrs. R. and E. Evans, Peckham, S.E. Mr. R. L. Boulton, of Cheltenham, is executing the sculpture and carving.

THE *Building Budget* of Chicago complains in an editorial note that in that city everything is sacrificed to utilitarianism, and that the lines of buildings are unbroken by towers and spires. The cheap and flimsy character of the churches is specially adverted to, the writer observing that many of the Chicago churches are no more imposing than seaside cottages, and have a plenitude of roof, giving the appearance of having been blown over sideways. It may be said, to the discredit of the city, that Chicago has the longest thoroughfare in the world that has no church throughout its whole length. This triumph of utilitarianism is West Madison-street, which has passenger cars running for nearly six miles, but has not a public building or square along the whole route.

An inquest was held at St. Alban's on the 8th inst. on Thomas Curtis, aged 36, foreman scaffolder at the cathedral, who was killed the previous day by a fall from a scaffold which was being struck outside the south transept. Mr. Brown, general foreman at the Abbey, said that deceased was one of the best scaffolders he had ever had. He had never had a steadier one, and would never wish for a better; he was now extremely sorry to lose him. He had been engaged at the Abbey in this particular branch of work for about ten years, and they had not had a mishap through faulty construction up to the present moment. He built the scaffold from which he fell, up from the ground, with assistants. He had had really entire charge of the scaffold building during the ten years he had been there, and witness would unhesitatingly say that he had never seen a better scaffold builder in his life. A verdict of "Accidental death" was returned.

The Government is believed to be about to remove the Platters Rock in the centre of Holyhead new harbour. This enormous rock, which is really a small island, stands directly in the path of outgoing and incoming vessels. In storms it is a constant source of danger to mariners who run for shelter into Holyhead harbour. The local board at Holyhead have taken the initiative in the movement to get the rock removed, and Baron de Worms writes that the Board of Trade have the question now under their consideration.

The Wallace Monument on the Abbey Craig, Stirling, has been enriched by the addition of three busts of illustrious Scotsmen — George Buchanan, John Knox, and Sir Walter Scott. The sculptor is Mr. D. W. Stevenson, R.S.A., whose art has already largely contributed to the embellishment of the monument. His colossal statue of Wallace was only unveiled the other month, and more recently busts of Bruce and Burns from his studio were placed in the museum, which gives promise of becoming, on a small scale, a patriotic Walhalla.

A branch line of railway 1½ miles in length is being made from Drumshoreland Station to Broxham Oilworks. Messrs. Thomas Pate and Son, of Airdrie, are the contractors, and subcontracts have been let for the three sections of the work to the local firms.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Architectural Association. Visit to Minley Manor (Messrs. Davey and Williams, architects), and Bramshall, one of John Thorpe's houses. Trains from Waterloo, 11.45 a.m.

TUESDAY.—Sanitary Congress at Bolton. Opening address by Lord Basing. 8 p.m.
Glasgow Architectural Association. "An Architectural Chat," by F. H. Newberry, head master Glasgow School of Art.

WEDNESDAY.—Sanitary Congress at Bolton. Address to Section I., "Sanitary Science and Preventive Medicine," by Prof. J. R. Reynolds, to be followed by papers and discussions. 10.30 a.m.

THURSDAY.—Sanitary Congress at Bolton. Address to Section II., "Engineering and Architecture," by Prof. T. Hayter Lewis, F.S.A., to be followed by papers and discussions. 10.30 a.m.

FRIDAY.—Sanitary Congress at Bolton. Address to Section III., "Chemistry, Meteorology, and Geology," by Dr. A. Dupré, to be followed by papers and discussions. 10 30 a.m.

ARCHITECTURAL ASSOCIATION,

9, CONDUIT STREET, W.

A Visit will be paid on SATURDAY, September 24th, to a Mansion in Cadogan-square, S.W., Messrs. Ernest George and Peto, Architects. Assemble at 2.30 p.m.

THOS. EDWARD PRYCE } Hon. Secs.
FREDERIC R. FARROW }

CHIPS.

A branch of the Birmingham and Dudley Bank is being erected at Hay, Brecknockshire, from plans by Mr. R. F. Kempson, of Hereford.

On Monday week the foundation stone was laid of a new mission church at Talke-o'-th'-Hill, to be known as St. Martin's Mission Church. The new structure will cost £400, and will consist of a mission church and recreation ground, the former being 54ft. by 24ft., accommodation being provided for 202 persons. The architect is Mr. J. Beardmore, of Bucknall, and the builder Mr. S. Booth, of Kidsgrove.

Mr. J. T. Harrison, one of the local Government Board inspectors, held an inquiry at Horsforth on Friday into an application made by the Horsforth Local Board for sanction to borrow £1,500 for the purpose of completing a new road through Hawksworth Wood. The plans were produced by Mr. W. H. Parkin, surveyor to the board, who said the total cost of the road would be £2,150. There was no opposition to the proposal, of which the inspector expressed his approval.

Boxford parish church, Suffolk, was reopened on Tuesday after restoration, including the substitution of oak seats for high pews in the nave, and of a carved waggon roof for a flat plaster ceiling over chancel, the construction of new floors throughout, and other works. The outlay was over £1,000.

The free library and Fielder promenade at Fleetwood were opened on Saturday. The free library occupies the buildings of the institute erected by Mr. B. Whitworth, and now acquired and presented to the town by Mr. Samuel Fielder. The promenade is being carried out in three sections, the first and second of which were opened on Saturday. They consist of an esplanade 21ft. in width, and a carriageway 35ft. wide, formed of asphalte macadam.

New schools are about to be built at Laverstock, Wilts, from plans by Mr. Fred. Bath, of Salisbury.

A new theatre is in course of erection at Kimberley, in the Diamond Fields district, South Africa. Mr. Sydney Stent, F.R.I.B.A., is the architect, and Mr. C. T. Jones the contractor.

A large three-light stained-glass window has been recently placed in the south transept of St. John's Church, Brooklands, Manchester, in memory of the late Mrs. Lloyd. The window contains scenes illustrating the raising of Lazarus. In the circular light at the top is a full-length figure of St. John. The work has been carried out by Messrs. Lavers, Westlake, and Co., London.

The death is announced of Mr. John Duncanson, a native of Airth, and a builder in Glasgow, in his fifty-fourth year. Mr. Duncanson erected the Grand Hotel, Charing Cross; the Stirling District Asylum, Larbert; Sandringham Terrace, and many streets in Hillhead and other districts.

One of the great architectural features of Sydney is St. Mary's Roman Catholic Cathedral, the northern portion of which, as far as the central tower, it is proposed to complete as a memorial of the centenary of New South Wales. Mr. W. W. Wardell, F.R.I.B.A., of George-street, Sydney, is the architect, and the total outlay on fabric and fittings up to the present time since the foundations were laid in 1866 has been £113,666. The last contract, that for the north transept and Archbishop Vaughan Memorial Window, has been carried out by Mr. John Young.

CHIPS.

The tender of Mr. W. M. Blackburn, of Newport, Mon., has been accepted at £2,700 for the erection of a new theatre in that town. Mr. W. Gardner, of Newport, is the architect.

At Glasgow Northern Police-court on Monday, a plumber, Robert Lyall, was sentenced to seven days' imprisonment on a charge of fraud. Lyall had been engaged by a grocer in North Woodside-road to repair the roof of his shop, and obtained 3s. 9d. from the grocer on the representation that he had paid that sum for solder. Subsequently, during a heavy rain, the roof again leaked, and on examination it was found that Lyall, instead of using solder for the repairs, had put on a quantity of putty.

The new Middle Class Schools erected for the Skinners' Company at Tunbridge, were opened without ceremony on Wednesday. The building is Gothic in character, built of red bricks, and the chief schoolroom, measuring 70ft. by 30ft., is covered in by an open roof. Mr. A. Burnell Burnell is the architect, and Messrs. Oakley and Drake were the builders. The late Mr. Cooper Fagg was clerk of Works until his death, just before the building was completed, cut short a promising career.

Architects and Engineers who require a perfect Weather-Resisting Stone for Building Purposes, should specify "THE IMPERISHABLE CONCRETE STONE, manufactured by FAMBRINI and DANIEL, Excelsior Works, Lincoln," who produce every description of Masonry, from the ordinary Window Sill to the most elaborate Carvings. Best workmanship only. Estimates and particulars upon application. Established 50 years.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, post free.—LESSER FRIEDLANDER, Tobacconists' Complete Furnisher, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 60 years.

Holloway's Pills.—These famous Pills purify the blood, and act most soothingly on the liver, stomach, bowels and kidneys—the great mainsprings of life. They are wonderfully efficacious in all ailments incidental to females. To the emigrant, traveller, soldier, and sailor, they will be found invaluable in the time of need.

HYATT'S LENS and "SEMI-PRISM" LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

BATH STONE.

DOULTING FREESTONE.
THE CHELYNCH STONE.—This Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.
THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.
HAM HILL STONE.
Greater facilities have been provided for working these Quarries, and the Stone can be supplied in large quantities at short notice.
Prices and every information given on application to
CHARLES TRASK and SONS,
NORTON-SUB-HAMDON, near ILMINSTER, SOMERSET.
London Agent:—
E. A. WILLIAMS, 16, Craven-street, Strand.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BEDMINSTER.—For the erection of a new school at Knowle, for the School Board for Bedminster, near Bristol:—

Broad, T.	£1,978 9 0
Wilkins, J., and Son	1,940 0 0
Stephens and Bastow	1,923 0 0
Forse, H. A.	1,880 10 0
Turner, S.	1,855 0 0
Wilkins, R., and Son	1,854 0 0
Eastabrook and Sons	1,824 0 0
Cowlin, W., and Son	1,800 0 0
Bastow, J.	1,792 0 0
Beaven, A. J.	1,773 0 0
Church, W.	1,723 0 0
Perrott, J.	1,658 12 0
Hayes, C. A. (accepted)	1,657 0 0

BOURNEMOUTH.—For carrying out the sea-water watering scheme, for the commissioners. Mr. G. R. Andrews, surveyor:—
Sanders, H. I. J. (accepted) ... £7,883 8s. 0d.
(In lieu of that from Messrs. W. H. Hill and Co. recently accepted at £6,768, but withdrawn on account of error of £1,000.)

BRIDGNORTH.—For repairs to the Grammar School, for the town council:—
Head, R. (accepted)).

BRIDLINGTON.—For the erection of a sea wall and promenade in front of the Beaconsfield estate, for the local board:—
Clarke, Sheffield (accepted) about £9,000 0 0

BURTON-ON-TRENT.—For the erection of the Broadway schools in Branstone-road, accommodating 525 children, for the Burton School Board:—
For the main buildings:—
Hodges (accepted) ... £4,640 0 0
For asphalting, &c.:—
Mellors, H. C. (accepted) ... 815 0 0
(Nine tenders received; cost per head £8 11s. 9½d.)

GLOUCESTER.—For the erection of Salvation Army barracks, at Gloucester, for General Booth. Mr. E. J. Sherwood, 101, Queen Victoria-street, London, E.C., architect. Quantities by the architect:—

Gardner, G.	£1,156 17 0
Munday, J., Wimbledon	1,110 0 0
Lane, D.	1,010 0 0
Williams, W.	990 0 0
Jones, W.	984 0 0
Coxhead, F. J., Leytonstone	960 0 0
Jones, D. C. and Co.	948 0 0

Rest of Gloucester.

To Municipal Authorities, Engineers, and Surveyors.

JENNINGS' PATENT URINALS

FOR PUBLIC THOROUGHFARES AND RAILWAY STATIONS,

Have been adopted in all the principal European Cities. They are particularly adapted for public use, being simple in construction, strong, and most economical as regards the water supply.

JENNINGS' STONEWARE DRAIN-PIPES

Have been specially selected and adopted, after severe tests, by the South Australian Government for the drainage of Adelaide. The Sockets and Pipes are made in one piece under great pressure by Steam Machinery from the finest selected Poole Clay taken from Beds on the works, and, by hydraulic testing, have been proved superior to any other pipes in the market. *Prices and particulars can be obtained from*

GEORGE JENNINGS, STANGATE, LAMBETH, LONDON,

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1707.
FRIDAY, SEPTEMBER 23, 1887.

THE EXETER THEATRE DISASTER.

THE verdict of the jury in the case of the Exeter Theatre calamity will be received with considerable interest, though not without serious alarm at the large amount of risk evidently entailed on the playgoing public. As regards the efforts of the manager and his assistants to extinguish the fire, the Coroner thought all that could be done had been tried, although the fire-extinguishing apparatus had not been so complete as might have been provided. Referring to the cause of the fatal calamity, the gallery exit and staircase might have been *per se* perfect as a piece of construction; but their arrangement was faulty as a means of providing safe exit for four hundred people from the gallery. These points have been made the subject of a few very strong comments, appended to the jury's verdict of Accidental Death. In the first place, the licensing magistrates are censured for granting a license before the theatre was properly completed and inspected; they not having completed the inspection of the theatre, and satisfied themselves that all their suggestions had been carried out, especially as regards the second exit from the gallery; and that they allowed themselves to be misled by the architect in the matter of the exit from the gallery to the second circle. The magistrates apparently had never noticed the fatal post and pay-office which obstructed the gallery stairs, and which were not put up till after their visit of inspection. The riders of the jury are to the following effect:

1. We consider the magistrates are much to blame, and deserve censure for not having completed their inspection of the theatre and satisfied themselves that all the suggestions made by them had been carried out, especially the second exit from the gallery, and that they allowed themselves to be misled by the architect in the matter of the exit from the gallery to the second circle. We consider also that it was unwise to grant a license for a building in such an unfinished state. We regret the action of the magistrates in declining as a body to recognise the authority of the Coroner's Court, and their lack of courtesy to the Government Commissioner attending it.

2. The jury regret that the Town Council's by-laws do not allow of their efficient control over public buildings, especially as regards means of ingress and egress, and that their surveyor was not more fully instructed. We recommend a radical revision of such by-laws without delay.

3. We deeply deplore that the architect, having been engaged by the directors as a specialist, should have produced a building with so many structural defects, especially in the place where so many of our fellow-creatures fell, at the second landing outside the pay office. We find that many persons lost their lives owing to the post erected there, and consider this post, the gateway below, and the pay-office just above, with the door opening outwards, a very bad arrangement.

4. The jury further think the architect failed in his duty in not providing a second exit for the gallery. They do not consider the way over the rail from the gallery to the second circle a legitimate exit in any case, and are surprised that Mr. Phipps, as a business man as well as an expert in theatre designing, should have suggested it in his evidence. That the gallery staircase *per se* was not a ready exit from the theatre, and that when the presence of the post is considered, which Mr. Phipps admits was there on the opening night, we regard it as doubly dangerous. That Mr. Phipps's explanation of the presence of the hydrant in the flies on the plan, and not in fact, was most unsatisfactory. That the jury do not consider Mr. Phipps qualified to ignore the rules of the Metropolitan Board of Works as regards the erection of theatres, and they think that had he followed these rules, as he alleged they would be, he would have acted wisely. That had the architect raised the roof of the auditorium several feet higher, it would have carried up the smoke, and have allowed the gallery audience more time to escape.

5. We consider that legislation bearing upon the inspection and remodelling of means of exit, and the stage working arrangements of all theatres, and the prevention of fires therein should receive the earliest attention of Parliament.

6. The jury suggest that some effectual plan of excluding fire and smoke from the stage and other portions of the building be adopted by the fixing of a water screen or other apparatus.

7. We consider that the Chief Constable should be empowered to make inspections at all times of all parts of the building, without notice to the directors or to managers. That he make such inspection at least once every month when the theatre is open, and thereupon transmit a report of his inspection to the town council, and state whether all fire-hydrants, ventilating apparatus, &c., are in perfect working order.

8. We suggest that before a magistrates' license is granted for any public building, such building shall be thrown open, with all its approaches, entrances, and exits, to the inspection, under police supervision, of all householders in the borough for a week after its final completion.

There is surely something radically wrong in a system of administrative law which could have made it possible that these defects could have been permitted to pass. Where are the by-laws of the Corporation? But even these are, it appears, inoperative, through want of efficient control on the part of the officials. The rules laid down by the Metropolitan Board of Works as regards the erection of theatres are explicit enough, and though not binding in the provinces, we cannot see how they came to be so completely set aside even by an expert of Mr. Phipps's standing. A second exit from the gallery which held so many should, at all hazards, have been provided, and we consider that every successive tier in height should be provided with additional, instead of fewer, exits. Some architects think that a gallery entrance may be small and inferior compared with those leading to the lower portion of a building, like the stalls or dress circle, and this mistaken view is generally acted upon, to the risk and danger of those who frequent galleries. The gallery staircase formed in the Exeter theatre a rather tortuous and awkward means of escape. The half-landings and separate flights, it is true, were there to check a precipitous rush in case of a panic: but these being provided, it was the duty of the magistrates or their officials to see that the staircase was absolutely free to its full width of 5ft., and that nothing should impede the descent of a crowd in case of fire. Then another mistake was to open a doorway from the upper circle on to the gallery stairs, making it do double duty. Here, again, is seen the error of making the single gallery entrance serve two divisions of the house instead of being confined to its chief intention. A further point to notice is the censure of the jury as regards the neglect of providing a hydrant in the "flies." Though shown on the plan, it was not fixed. How could so important a fitting have been overlooked? There is a further matter made the subject of comment by the coroner, and also by the jury—we mean the provision for carrying off smoke in case of a fire. The auditorium ceiling was too low, and a few feet of additional height would have made it possible for the hapless occupants near the ceiling to have breathed a little longer. The use of a water screen or some other apparatus is suggested as a means of excluding fire and smoke from the stage and other parts of the theatre. Certainly we are a long way behind in not having introduced a mode of getting rid of smoke. Nothing, we see, is said about the provision of an iron curtain to shut off the stage from the auditorium, though its advantages are not to be pooh-poohed by stage managers who find it expensive and troublesome. The double screens of plate iron with a 6in. air space, made by Messrs. Clark, Bunnett, and Co., would at any rate have done something at an early stage of the fire to have cut off the flames and smoke, which instead were wafted inwards towards the audience. Then, might not automatic sprinklers have been provided over and round the stage, like those fixed in Mr. Terry's new theatre in the Strand? But this, unfortunately, is not the time to speculate on what might have been done. Future legislation is demanded; and not only legislation, but administrative power and vigilance as well. At Exeter, unfortunately, the Metropolitan regulations had no legal binding force, although if they had, it seems doubtful whether they would have been carried into effect. The need of compulsory legislation is urgent, and competent officials should be empowered to inspect all theatres throughout the country, so as to supersede the services of licensing magistrates. But beyond all this, it is really the duty of architects of theatres, as of all other buildings, to take all reasonable precautions. We write with reserve; but at present we cannot but think the censures of the jury on Mr. Phipps are fully warranted by the facts. We should be glad to find any reasonable ground for a different conclusion. A fortnight since Mr. Phipps wrote to us that he was "being abused by all the Press with no real knowledge of the matter," and that "when the proper time comes" he would supply us with plans of the structure at Exeter. The "proper time" has certainly come for any such justification as Mr. Phipps may feel inclined to offer, but at present we certainly do not see how the two damaging points dwelt on by the jury—the insufficient exits to the gallery and the absence of the hydrant in the flies—are to be explained.

SANITARY SITES AND ARRANGEMENTS.

THE rather serious outbreak of fever of different forms in various parts of the Metropolis and provinces has awakened many sanitary authorities to their duties as guardians of the public health. In many districts of London, householders have received printed instructions cautioning them to attend to the weekly removal of their refuse and the contents of ashbins, to the periodical cleansing of cisterns, and to the examination and disinfection of all drains that may be out of order. These instructions and gratuitous leaflets on the desirability of disinfection have doubtless stirred many apathetic householders to the sense of their duties to themselves and neighbours; but they are of very little avail to stay the dissemination of a disease when the evil is already at our doors. At best they come then only as remedial measures. For example, it is of little value to a householder to be told that he must cleanse, reconstruct, or disinfect when he resides in a house faulty in construction and full of sanitary defects. Only palliative measures can be taken, while the actual evil remains in the house and its system of drainage. Indeed, it is remarkable that the inmates of some houses should escape an epidemic when everything favourable to its existence should remain in the house, its site, and its fittings. They must do so simply from the natural power of their constitutions to throw off the poison, whereas another tenant would be stricken down.

There are two noticeable classes of buildings which come under the designation of unsanitary dwellings. The first are those which have been built upon unsanitary sites; the second, those in which the arrangements are imperfect. A great many of the smaller houses in London are built on soils which are notoriously of unhealthy character. In many cases the foundations have been excavated in made ground, formerly heaps of vegetable and animal refuse which have never been drained. These sites are numerous. At Battersea, Wandsworth, Camberwell, and many of the localities traversed by railways,

we find large excavations that have been refilled by scavenging contractors. These were formerly levelled, and let as building ground; but since the by-laws were framed for the foundations and sites of buildings in the Metropolis, under the Metropolis Management and Building Acts Amendment Act, 1878, the sites of houses are now looked upon as of some importance. Before that date, although sanitarians were fully aware of the danger of building on sites filled up with refuse, thousands of our suburban houses were erected on them, and there is little doubt that the ailments which occasionally afflict members of families who reside in these houses, the drainage of which is supposed to be good, are due to the gases which are emitted through a depth of made soil composed of animal and vegetable matter. Doctors and sanitary experts may have been called in to advise and report; the drainage has been probably laid down upon the approved system disconnected from the sewer, and ventilators introduced; but the secret of the ill health of the inmates has eluded their grasp, and there is slight suspicion that beneath the living-rooms is a mass of pestilential matter giving out in certain conditions of the atmosphere exhalations of the most deleterious kind. What wonder is it that certain of the inmates never enjoy good health! The existence of cesspools beneath floors is even now of common occurrence in country places; but the emanations from made soil are almost equally bad. The danger of living over sites of this kind was in time perceived, but, unfortunately, not till half our suburbs had been built upon. Now no house or other building can be erected on any site which has been filled up with "any material impregnated or mixed with any fæcal, animal, or vegetable matter," or with dust or slop, unless such matter or refuse shall be removed by excavation, and any holes are to be filled in with "hard brick or dry rubbish. The site, moreover, of every house is to be covered with a layer of good concrete 6in. thick," unless the site be of "gravel, sand, or natural virgin soil." So far so good. We cannot question the wisdom of these rules.

There are circumstances which have not been dealt with by legislation as regards to site, and we may here say a few words upon conditions which even these rules scarcely touch. In our mind we have a row of houses of modern construction built along the foot of a natural slope or hill, in a southern suburb of the metropolis, the soil being clay, and the basement floor some feet below the ground at the back, though the fall of the ground has given the houses in front an appearance of elevation above the road level. All the drainage of the high ground at the back naturally finds its way over the stratum of clay and into the basement. The houses are generally musty and damp. There can be no question of the pernicious influence of such a site, pleasant otherwise as it is. The concrete layer would not mend matters. What is wanted is an intercepting drain to carry off the drainage of the hills and rainfall along their foot, or a dry area all around the houses. The question of drainage of soil and interception of ground air, apart from house drainage, is one that does not trouble the heads of building legislators. House drainage may be perfect, and yet the house is not healthful—it is built on water-logged soil, or upon a flat clay stratum always damp. We remember a sound maxim given by Mr. Edwin Chadwick, the veteran sanitary reformer, to the effect that the subsoil water of the site of a house should be lowered by drainage to not less than 3ft. from the surface.

Applying this test, we should like to know how many sites, in the South of London, for example, would pass? The sewerage works of the Metropolis have considerably improved this aspect of the question, yet we are sure that defective drainage of the soil has favoured the spread of epidemics in all the low districts. A sound sanitary specification ought to make the matter of subsoil drainage a primary one; instead of which, it is shelved. A dry subsoil would rob an inferior superstratum of its dangerous properties. Let us turn to the second condition. We have a variety of dicta on the subject of sanitary fittings, and these are so well understood that it would be presuming on the ignorance of the professional reader to repeat them. These rules have emanated chiefly from sanitarians, engineers, and plumbers. Champions of traps and ventilators have essayed to descant on the merits of systems of drainage; but they have left out of view principles of house arrangement, which have been regarded with indifference or taken as unalterable. Many of the modern houses in and near London are very defective in their sanitary arrangements. Such things as closets under pantries or larders, or sitting-rooms, or placed between two bedrooms without external ventilation, and lighted by a borrowed light through one bedroom, are simply abominations, and not uncommon; but if the drainage is good, they would be passed. Tenants have to submit to these arrangements, as they cannot appeal to any authority to rectify structural abuses. They are matters in the hands of the builders; in some towns the by-laws under the provisions of the Public Health Act require that every closet within a building shall have one side an external wall; but how few of the older houses are planned upon this principle? The general distribution of the fixtures are often imperfect. In good houses we find lavatories in bedrooms or next them, so that the drainage system is in communication with the sleeping apartments. This is a generally condemned plan, but is still found in superior houses. Another very common arrangement is to find two closets in different parts of the house. In all these instances simplification and easier sanitary control might have been insured by grouping together the conveniences so as to economise piping and ventilating arrangements. Plumbers' fixtures are so well understood that it is almost superfluous to give advice upon them. What we more especially desire to say is that sanitation, to be effectual, ought to be arranged during the planning of the building—in fact, before the house is erected on the site. Before we lay a brick the drainage of the soil should be attended to. A damp or doubtful soil should be cut off from the building by a ventilated space below the ground-floor level, or if a basement must be provided, then by a lining of asphalte. Effectually to accomplish the purpose requires a careful study of the site, its levels and drainage. We must attribute the prevalence of a large class of diseases and epidemics to damp and unhealthy substrata, from which vapours and gases are constantly being evolved partly by the warmth of the house. While attaching much importance to the sanitary work of the last twenty years, we ought not to lose sight of the fact that it has been of a spasmodic nature, and that its rules have been applied only to a small percentage of the houses in our great towns.

SANITARY DRAINAGE OF BUILDINGS.*

A CONCISE little handbook has been published by Mr. Paul Gerhard, C.E., of New York City, embodying notes on recent practice in sanitary drainage. It is issued in Van Nostrand's Science Series. The author, who is an authority on sanitary matters, and whose works on the subject of house drainage and plumbing we have before noticed, ha condensed a great deal of information in thi little guide for architects, engineers, and others With the help of it one may easily prepar a plumbing or drainage specification. The lead ing requirements of plumbing work will b found briefly mentioned, and the second part "Maxims of Plumbing and House Drainage, embody in terse sentences the rules to be ob served on planning. We commend the follow ing rules to all architects: "Avoid a useles multiplication of plumbing fixtures. Let th amount of plumbing work in a house b reduced as much as possible. Above al avoid locating fixtures in unoccupied o spare rooms. Do not place plumbing fi tures of any kind in sleeping rooms, no even in unventilated closets adjoining them Always arrange fixtures so as to be concentrate as much as is consistent with convenience i use, in compact groups. Have as few vertic lines of pipe as possible; avoid long horizont runs of pipe. In small cottages place th bath-room as nearly as possible over th kitchen, in order to reduce the amount piping and to simplify the whole work. small houses it is preferable to separate th water closet from the bath room, and to gi to each of them a well-lighted and ventilat apartment. In toilet and dressing-rooms adjoi ing bedrooms, the w.c., lavatory, and bath m be, however, arranged together. . . . Place soil, waste, and supply pipes outside of walls partitions. Let pipes pass in sight throu closets, and have them fully exposed in bat rooms." After a list of such rules the auth describes the construction, and lays do general conditions to be observed by plumber, the materials to be used, and weight of lead pipes for different pr sures. Referring to wrought-iron pipes, following specification is given for soil, wa and vent pipes. "To be of standard wrought-i pipe, having a uniform thickness of not than one-quarter of an inch, the pipes to lap-welded and proved at the iron mills to 53 per square inch by hydraulic pressure, t coated after being heated with a preparatio coal tar and asphalte (or to be treated with Bower-Barff or other rustless process); fitti for soil and waste-pipes to be protec against rust by the same process as app to the pipes, to be tapped truly strai and to have a strong shoulder." Mr. Gerh furnishes concise descriptions of traps, sup pipes, stop cocks, valves, solder, pig and s lead, fixtures, cement, putty, sand, and mor The workmanship is next described, such pipe joints, &c. Test of the work during struction and after completion, and suggest for a sanitary code are included in this c pendious little book, which will be a us *aide memeire* to the professional man. memoranda of cost will be of service to American architect and builder.

* Notes Embodying Recent Practice in the Sanitary Drainage of Buildings, &c. By W. PAUL GERHARD, C.E. New York: D. Van Nostrand.

Six memorial stones of a new Wesleyan scho Hipperholme, near Halifax, were laid on Satu The new school, which is to cost £1,200, adjoin the present chapel, and will accomm 340 children, having ten classrooms, be assembly room. Mr. G. H. Elliot, of Hipperh is the architect.

A new central post-office for Douglas, Is Man, was opened for business on Monday. situated in Regent-street, off the Promenade. building has been planned and built unde superintendence of Mr. H. Tanner, Survey Works, London. The clerk of the works wa G. H. Patterson, of London, while the contra been carried out by the executors of W Gradwell, of Barrow-in-Furness, their forem the work being Mr. Joseph Allison.

The City Commissioners of Sewers ha structed their Street Committee to co whether any, and, if any, what, better m could be adopted for cleansing the cat gullies, and drains in the City and for imp the construction of the drain-pipes leading main sewers.

The memorial stone of new schools n course of erection in connection with All Church, Hoole, Cheshire, has been laid Countess Grosvenor. Mr. Davies Colley, of street, Manchester, is the architect, and Browne, Tower Works, Chester, the cont The cost will be £1,300, the style Gothic, facing materials local brick, with Ruabon cotta dressings.

SANITARY CONGRESS AT BOLTON.

THE tenth annual Congress of the Sanitary Institute was opened at Bolton on Tuesday by a formal reception by the Mayor at the Town Hall, after which an exhibition of sanitary apparatus and appliances arranged in the Drill Hall was inaugurated. The Exhibition is divided into the following classes :—Building materials, construction, and machinery ; water supply and sewerage ; heating, lighting, and ventilating ; personal hygiene, foods, filters, and disinfectants ; articles of sanitary interest not included in the above classes. To the drill-shed, which is admirably fitted for the purpose to which it is temporarily devoted, an annexe has been added, the whole being filled with exhibits. The first general meeting was held in the evening, when the president, Lord Basing, better known as Mr. Sclater-Booth, delivered an address, on

SANITARY LEGISLATION, PAST AND FUTURE.

His lordship referred to the advance in sanitary science during recent years, originating with the Royal Sanitary Commission, and carried out under the Public Health Act of 1875. This measure, he considered, contained the most complete sanitary code to be found in any country, and it had greatly tended to diminish the death-rate. Still there was no finality in sanitary legislation, and while the Act had been amended in some details, many other modifications had been suggested. Powers should be given to enable local authorities to provide a dual system of sewerage and surface-water drainage, to protect sewers from noxious vapours from chemical and other works, to make the connections between the house drains and sewers, and to regulate the trapping and arrangement of such house drains, to prohibit the use of "lock-up" shops as dwellings, and the occupation of back-to-back houses. Greater powers were also needed with regard to checking the spread of, and dealing with, infectious diseases.

On Wednesday the section devoted to sanitary science and preventive medicine was opened by an address from Professor J. Russell Reynolds, F.R.S.

THE PLANNING AND ARRANGEMENTS OF SUBURBS.

Section II.—"Engineering and Architecture"—was inaugurated yesterday (Thursday) by an address by the president of the section, Professor T. Hayter Lewis, F.S.A., F.R.I.B.A. It was illustrated by many diagrams, maps, and plans, to large scale. Professor Lewis remarked that while in classic times the creation of a new city almost emphasised the foundations of a new colony, while in mediæval days towns arose round monasteries and the seats of bishops, or round a castle, of late years numerous towns, such as Fleetwood, Crewe, and Southport, had suddenly sprung into being ; whilst, from each of our large cities, extensive suburbs were being pushed out, forming, in fact, new towns. These extensions, to which he would confine attention, had almost invariably been carried out by speculators without any general definite guiding plan, with little or no forethought for future extension, and with slight provision for supplying the inevitable future wants of the inhabitants. Thus, in course of time, spaces had to be cleared out for churches, schools, institutes, baths, and such edifices, and clearances had to be made to allow for free breathing. But if this were the time of activity in building new towns and extending old ones, it was also pre-eminently the time of activity and power in corporate bodies. New and extensive powers were being acquired and exercised by corporations for the sewage, the supply of water and of gas, for providing open spaces, regulating the width of streets, and even the height of rooms and size of windows. He wished simply to extend these powers. He wished that when it might appear evident to a corporation that any district would require before long a large accession of houses for a population which was clearly increasing to an overflow, such corporation should have the powers (and he thought that public opinion would require it to exercise them) to acquire control over the requisite land—to formulate a general plan, giving the width and direction of the streets—to provide spaces for such public buildings as were certain to be required in a well-regulated community, and for such open spaces as were required for its healthy enjoyment. His scheme was not a very grand one in any respect ; he simply wanted to provide at first for those requirements which must eventually be provided, which could only be fulfilled at a great cost, and even then imperfectly, if not so provided at first. He did not even suggest that the corporation should build, but that it should give general guiding directions, leaving the working out to private persons, or to such companies as had of late done so much good in building dwellings of various classes, from the highest to the lowest. The president alluded to the earnest attempt made, some thirty-five years ago, by the late Professor Cockerell, R.A., to obtain a public control over the proposed buildings at Hampstead, a suburb now covered with houses. Mr. Cockerell drew out a design by which the whole of that suburb might have been built over on one definite plan, utilising the various hills and valleys, so as to take every advantage of its picturesque beauties. Public opinion was not ripe for such a course then, and this grand opportunity was lost. Professor Lewis proceeded to remark that he had taken as his text a smaller district near London, actually built over within his own memory, explaining his points by an enlarged plan of the district from the Ordnance map. He would point out, first, its defective arrangement, and, secondly, the way in which, by a little foresight, the defects might have been avoided. The houses in this district were of various classes. Some of them were good private dwellings, with forecourts and trees. Many others were tenanted by a superior class of artisans ; whilst other portions of the district realised the description given by Mr. Walter Besant, as being composed "of small houses almost all of one pattern—with no green thing to be seen—where no one plants trees. No flowers are in the windows—nothing to gladden the eye." And portions even realised the darker picture drawn by Mr. Froude, who described the dwellers in such a district as having "no sight of green fields, no knowledge of flowers, and with no entertainment but the music-hall." The district he referred to was still growing rapidly under the auspices of the speculator, who was building acre upon acre of houses with just so much care and attention as would allow him to obtain the highest rent at the least cost. It was bounded on the west and south sides by a railway, by the side of which ran the main road, about 30ft. broad, not wide enough for a footway on each side ; its one narrow path next the houses being crowded with foot passengers, and the road itself made narrower by costermongers' carts and stalls. On the north-west side the boundary was a really good road nearly 60ft. wide, and at the north-west angle where these two roads met was a railway-station, receiving and discharging thousands of passengers every day, and to the south was another station. To the east were spaces as yet unbuilt upon. This district had been filled up in a haphazard way. The builders had acquired one field after another and followed its irregular forms, or those of the country cross-roads or ditches, in laying out their new streets, and the result was about as bad a plan as it was possible to imagine—not in the slightest degree picturesque, simply puzzling and exasperating. One of the chief features in the district, the railway-station to the south, was altogether ignored, as it opened merely on to the narrow road, with no street opposite any part of it ; and a large number of the streets had dead ends to them, completely closing them against through ventilation, and very many more were not thoroughfares. The reason was that the builder who took the first area covered built the streets to the extremity of his odd-shaped fields, and used every inch of his ground, not leaving a vacant space for any opening eastward. So when the second builder came he was obliged to run new streets with dead ends, there being for more than a quarter of a mile not a single opening to the west. The further and important result was that the whole of the district eastward had been shut off from the main station to north-west, to which the slightest foresight would have given it an easy access. Such a suburb suggested how, by a very little forethought, a corporate body could so arrange the site as to have the same number of people at the same cost and on the same space of ground as was now covered, making such provision as would make it healthy and cheerful, and providing, at the outset, for such public buildings as must be eventually required. The necessity for some such provision had been repeatedly recognised, and in the appendix to the report of the Poor Law Commissioners, 1842, signed by the well-known name of Edwin Chadwick, was a suggested plan by Capt. Vetch, R.E., for laying out the suburbs of Birmingham, very much on the same principle as was now advocated. In these proposals the president said he had no Utopian schemes in view. He simply took the conditions of life as he found them, and did not suggest any provision for streets or buildings, public or private, not founded upon some actually existing. On a second map he showed the London suburb already described, with the streets, &c., rearranged as he would suggest them to have been laid out from the first. He held that it was drawn on the strictest utilitarian principles ; he had resisted all attempts at crescents or other curved lines, which would produce, no doubt, a much more pleasing effect than he had done, and there was not one single frontage which was not straight. All that had been done was to insure a ready access from any one part to another, and to provide that each street should have its ending in a wide, well-ventilated thoroughfare. Each district, too, would probably have some local peculiarity or object of interest, suggesting a varied plan, such—e.g., as the great Church of St. Paul, the Exchange, the Tower, the river, which formed the key-notes of Wren's design, and as the prominent hills furnished the leading lines in Professor Cockerell's ; or it might be some old ruin, something to make one think and to conjure up memories of bygone times, sermons or histories in stone, and so be religiously preserved. But, unhappily, the district described had no hill, no view, no river, and they had to think only of stations and tramcars. Having taken the two boundary roads as following the existing lines, they had to determine the direction of the main intermediate streets, the first consideration being the probable direct lines of traffic. The chief of these would be a wide avenue bearing direct to the railway station, and another bisecting it, each 60ft. wide, these lines to be followed by other thoroughfares of 40ft. wide, and all to be planted with trees. Professor Lewis proceeded to deal in some detail with the public works and buildings for which provision should be made, assuming that, as a matter of course, the sewers, water, and gas supplied would be provided in the usual way. In the first place, he would set aside a strip of land outside the whole for a park. Its distance from the furthest point would be about that suggested by Mr. Besant—viz , half to three-quarters of a mile. Neither in this case nor in that of public buildings did he propose the work to be undertaken at the first, but only so to arrange, at the first, that the sites should be so reserved as to be available when required, these buildings to include offices for the local authorities, and the library, reading-room, and science and art schools. The park would be about the size of the Hesketh Park at Southport, and in the arrangement of these public buildings it would be difficult, he thought, to take a better example than that of Southport, whose Lord-street and Albert-road formed one of the prettiest vistas that he knew, the chief public buildings being located behind a group of trees. Outside the park he would place the infirmary and convalescent home, a position in which they would have free light and air. If any one suggested that such a position would be too public and lessen the enjoyment of the park, he would refer him to the infirmary and children's hospital in that town of Bolton, and ask him whether, as a simple matter of landscape effect, to say nothing of the value of such an outlook to the patients, he would wish this picturesque building, designed by one of their able townsmen, Mr. Knill Freeman, to be removed. Or again, think of the charming way, and without the slightest feeling of sadness, in which the promenade at Southport ended with such a building, whilst at two such different places as Manchester and Hastings the infirmary formed one of their most prominent buildings. The market might be open at the sides ; but covered as at Preston and Blackpool, or be inclosed as at Bolton, Southport, or St. John's at Blackpool. He knew that many towns of importance (Norwich and Cambridge

amongst them) had still little more than open and uncovered market-places, healthy looking and pretty, with fruit, and flowers, and vegetables, on a fine day; but they often had quite other days, and the attempts at covering up and protecting the stalls then turned the market-place into a wretched collection of tumble-down huts—he had almost said as bad as Fleetwood. If the quarter were chiefly for artisans, public washhouses would be indispensable; and in any case, no matter what the class of inhabitants might be, he looked upon public baths also as a provision which could scarcely be valued too highly. He had not marked out definitely sites for these buildings, churches, chapels, or schools; but all these were provided for in the district as it existed, and sites would undoubtedly be claimed for and provided, whatever the general plan might be. He would proceed now to some other details, as to which he might not possibly have the assent of his audience. First, as to drinking fountains. That such small ones as were now commonly seen should be provided, all would doubtless approve; but he wanted something more than these, as much for the sake of health as for ornaments to the town. They all knew the conditions of house cisterns in many districts of the poorer class. He need not go into details, but would say that a good supply of water, pure for drinking, was an element of health which ought to be provided, and that it could not be provided in a better way than by fountains. These, in what were now called the dark ages, formed some of the chief ornaments of a town, and he saw no reason why they should not do so now. He did not want to bring in such vast bodies of water as were brought through miles of aqueducts into Rome, or such lavish displays as might be seen—*e.g.*, in Paris, or even such things as our fountains in Trafalgar-square. Nearly all these sent their waters into the drains. There were fountains even now in most of our towns, but with all the water running to waste; whereas in some of the most picturesque mediæval examples it came out in small useful jets, as he would have them there; and he felt no doubt that by a careful arrangement of gas-jets the effects of frost might be prevented, and a great boon thus conferred in winter on rich and poor alike; whilst, by a skilful design, they could be some of the most pleasing ornaments to the town that could be conceived. As part of the water must go to waste, send it to feed a small stream in the park, like the one at Bolton or at Hastings. Another accessory was that of seats placed at intervals between the trees, and to complete his plans he would have a small open space opposite to each railway station. Now they had to see, before entering into the question of the kind of houses to be provided, how much the plans suggested had trespassed upon the space now occupied. He had laid out his main roads in very much the same general direction as the present ones, though in less circuitous lines; but had made them 60ft. wide instead of 40ft., and had set apart spaces for public buildings, &c. The smaller streets he had made 40ft. wide, the width required by the Model By-laws being 36ft. The space assigned to the park need not be taken into calculation, as it was altogether outside that now built on; and it would therefore be seen by comparison of the plans that the great waste of space necessitated by the irregular plan of the district as now actually existing would allow to a very great extent, if not altogether, for the extra space which the suggested rearrangement would require. As to the general arrangements of the streets and houses, he called attention to some methods, unusual to us, with which one met abroad. Omitting any notice of the large many-storied houses familiar on the Continent, he would take as examples one of the northern towns in Europe, Hamburg, and one of the southern ones, Naples. At Hamburg, the president continued, the arrangement is peculiar. The main streets are wide, and give to a casual passer-by scarcely any indication of their affording access to any other streets. But a nearer inspection shows numerous doorways, so low and narrow that they appear to lead only into cellars, and through which you have often to descend by steps, and these lead into the streets behind, locally named Hofs, which we should call alleys, and which are, of course, completely closed against ventilation from the main street. They vary from 20ft. to as little as 5ft. in width, the houses in the wider streets overhanging on each side and being densely populated. They usually abut on canals, and when these are dry the result in hot weather may be imagined. This arrangement, intended, no doubt, to bring different classes of the people together, reminds one of the Wynds of Edinburgh, but with all their evils intensified, and a worse result could scarcely be imagined. Very many of these have been demolished, but a large number still remain. At Naples the same attempt has been made, and the particular class to which I have alluded may be seen to perfection in the drive through Portici. The streets throughout are wide, and lined for the greater part of their length with frames of macaroni hung out to dry. The houses on each side are several stories high, the first floors (*piani nobili*) having wide balconies, and altogether having a cheerful look, and being tenanted by well-to-do and often wealthy people, whose apartments are entered from an internal court approached from the street by a lofty carriage gateway. But the lower stories throughout, close on the ground, are tenanted by humbler classes, their rooms entered from the street. Here again we meet with an attempt to combine the classes, and thus prevent one neighbourhood being given up to the poor and another to the rich. But again this fails. The lower rooms have no windows or other openings at the back, and derive the whole of their light and air from the street. The state of the inner rooms, usually parted off by a curtain as sleeping apartments, in the heat of an Italian summer may be imagined. Were it not that the people live almost entirely in the open air they must be decimated. The same arrangement will be found in most other Italian towns; but in them there is usually some opening, however small, at the back. Something of the same kind would appear to be adopted, judging from the plan only, in a flourishing town in our own country—viz., Great Yarmouth, the arrangement of which is very peculiar, and unlike that of any other English town with which I am acquainted. The main streets are wide and well ventilated, and lined with good houses (mostly shops) several stories high; and running between these streets at intervals of about 45ft. are long narrow alleys, termed Rows, out of which lead houses of an inferior class. Looking at the plan only, this would seem to be no better than Hamburg; but in reality they are vastly better. The entrances are open for their whole height to a wide street at each end, or to the spacious quay, the alleys are cleanly kept and well paved, the houses in them are low, so as to intercept the light and air very slightly, and each has a small court attached to it; and the whole arrangement is not prejudicial to health. Nevertheless, the narrowness of the streets does, no doubt, to some extent, clash with the golden rule which Dr. Richardson put very strongly in his well-known lecture at Croydon (1879): "Make the sun your fellow-workman," which is much the same as the Italian proverb, "Where the sun does not enter the doctor does." Now, the president continued, in remodelling our district, what system shall we adopt as to the houses? The first question is as to their number of stories. This subject is a serious one, for hundreds of acres near our towns are now being covered with two-storied dwellings, clustered close together in populous neighbourhoods, or semi-detached when more in the suburbs. The governing idea in respect of the self-contained houses of two stories is that of privacy, or, in the better class of houses, the absence of stairs; but in many of our new London squares one large open space garden, or yard (according to the class of house), is common to all; and the separate houses are being largely superseded by the dwellings in flats. At the first sight the two-storied houses would appear to have the recommendation of insuring a less dense population than in the many-storied ones; but I wish to consider the subject on the basis of the same number of inhabitants in each case, the area gained by the extra stories being appropriated to open spaces in the way of yards or gardens, so that no question as to the bearing of the density of the population upon their health will arise here. In considering the relative merits of the different styles of houses, the first fact which presents itself is that with those of two stories only the whole of their inhabitants must live and sleep either immediately over the ground or directly under the roofs. The nearer to the earth the ground-floor is the cheaper it is to build, as less height of wall is required; the consequence is that the floor is raised a few inches only above the street level, and the occupant has only that space between him and the earth. The rest of the inhabitants must live and sleep directly under the roof—not a very pleasant experience even in well-built houses, whether through the heat of summer or cold of winter; and very many here doubtless know what is the case where the house is run up cheaply merely to sell. In point of economy of building, and of course of rent, it must be borne in mind that, though the thickness of the lower walls must be somewhat greater in a high house than a low one, one roof will cover, and one foundation hold up, four or more stories as well as they will cover and hold up two. As to the general feelings with respect to the subject, I recall and agree with the words of my predecessor, Prof. Roger Smith, in his address at Glasgow in 1883, that the system of flats is opposed to the general feeling; and I agree with him, also, when he says that they are not so unpopular now, and have many advantages. Of course the height of houses, whether in flats or separate, varies very much, buildings of five, six, or seven stories, being common enough—my own house has six; but I propose, in the comparative plans which I show, to limit our consideration to four stories, which is the limit suggested by Prof. Robinson, in his address at Newcastle, 1882. My plan shows, first, the actual space at present occupied by two blocks each of fifty-eight two-storied houses, and the open areas of streets and yards; and, secondly, the space which would be occupied and the area gained if the same number of inhabitants lodged in half the number of houses, but four stories in height. The contrast as to open space is rather striking, and with increased height the size of that space will of course increase. I leave this matter for your serious consideration. One thing more. In his well-known address in 1879, Dr. Richardson spoke of his ideal cities as competing with each other in the beautiful as well as the useful, and I have spoken all the way through of doing what we have to do in the streets, the building the fountains, in such a manner as to give a cheerful aspect to the scene, and afford some scope, however slight, to the feeling of beauty which is inherent in mankind, whether for colour or form, for a flower or a building, and not to offend the eye by the mean and the ugly. Years back, in the prime of his life, Mr. Ruskin pointed out most forcibly "that it is chiefly by private and not by public effort that a city is adorned, and that it did not matter how many beautiful public buildings it may possess, if they are not supported by and in harmony with the private houses (and, I may add, with the factories) of the town"; and if it be held that all we have to do is to provide houses which shall be fairly comfortable whether for rich or poor, and that rows of such houses will answer all the purpose if built with windows large enough and numerous enough, and that nothing else in them need be studied, then I say that our town lacks one great feature which might conduce to the pleasure of its inhabitants, and in neglecting that we have neglected one means, however slight, towards that healthful mental state which helps the bodily so well.

On the same day (Thursday) a conference of medical officers of health was held, and in the evening Dr. Arthur Ransome, F.R.S., delivered a lecture in the Town Hall. To-day (Friday) the section of architecture and engineering will hold a second meeting, and the inaugural address to Section III., "Chemistry, Geology, and Meteorology," will be given by Mr. August Dupré. Excursions are arranged for to-morrow (Saturday), and in the evening addresses to the working classes will be given by Major Lamorock Flower, Mr. A. Wyer Blythe, and Mr. Henry Law.

CLASSES FOR BUILDING TRADES

IT may be of service to call attention to the scope of the Technological Examinations of the City and Guilds of London Institute in connection with building. The programme of

the forthcoming session includes amongst the subjects the following of direct interest to the profession :—Iron and steel manufacture, glass manufacture, pottery and porcelain, photography, electrical engineering, the use of tools, plumbing, carpentry and joinery, brickwork and masonry. The class of questions on the ordinary grade relating to carpentry and joinery suppose an acquaintance with the nature and properties of the various woods used, the parts from which they came, methods of seasoning and preservation of timber, its strength, and mode of planning and converting materials so as to avoid waste and shrinkage and obtain the maximum strength of the material. The student will be required to know the names and uses of tools and labour-saving machinery ; and so much of mechanical drawing as is required to represent details of carpentry and joinery, and working drawings. A very useful series of questions refers to a knowledge of the proportions of stiles, rails, muntins in doors and windows, the proportions of rails for knobs or latches, a kind of knowledge often left to be picked up in practice. Other subjects are to be found in textbooks, such as the intersection of mouldings at various angles, enlarging and diminishing mouldings, modes of finding the sections of moulded bars and hip rafters in skylights, &c., the geometry of raking mouldings over square and oblique plans. Finding levels for hip rafters, splayed linings, and other work, newel and geometrical stairs, joints, hinging, and other general details referring to the carpenter and joiner's trade, are included, in addition to the mechanical principles of carpentry, as in the forming of roofs and trusses and partitions, bracing doors and gates, fixing and striking centres, and other matters. For the Honours grade, the candidate is supposed to have passed these subjects ; but the questions will be more advanced, and a knowledge will be required of : (1) the various methods of describing centres for arches of different curves ; (2) circular work, including methods of bending boards, ribs, or mouldings round circular work by kerfing, grooving, steaming, &c. ; the moulds and ribs in groins and domes, circle upon circle, &c. ; (3) handrailing, the proper height of handrails over fliers, winders and round landings, method of describing handrail scrolls, theory and use of tangent planes and lines as used in the tangent system of handrailing ; method of determining the position of the face-mould plane to pass through these points on the centre line of rail. The candidate will also be required to draw to scale. Data will be given him for the purpose, and during the year preceding the examination he will be required to design and execute an original piece of work and to forward the same a fortnight before the examination. A working drawing is to accompany the specimen with the quantities of materials used. The dimensions of specimen must be such as to fit in a box not larger than 15in. by 12in. by 12in. The candidate has the opportunity of selling his specimen, and the examiner is authorised to recommend to the Company of Carpenters the purchase of any work he considers of merit. The works of reference given include "Notes on Building Construction" (Rivington's), "Drawing for Carpenters and Joiners" (Cassell), "Handrailing and Staircasing" (Cassell).

The brickwork and masonry syllabus is equally comprehensive, and includes questions on the names and properties of bricks, excavating in various soils, mode of laying drain pipes, ventilating sewers, and the general principles of sanitary science. Limes and cements, mortar and concrete making ; the width and height of footings for walls of varying thickness ; damp-courses and air bricks, ventilating underground floors ; brickwork, bonding hollow walls ; construction of fireplaces, ovens, flues, are amongst the subjects, a general knowledge of which may be acquired by the study of the treatises on Brickwork and Masonry in Lockwood's series, and Rivington's "Notes on Building Construction." Stonework in its different branches has to be learned, besides the mechanical principles involved in brickwork and construction, weight, crushing strength, &c. In the Honours examination the candidate will, in addition, be required to know methods of cutting and rubbing for gauged brickwork, terracotta construction, vaulting, window tracery, &c. Perhaps the most necessary to the student of the long list of books mentioned are the following :—"Dobson's Treatises on Bricks and Masonry and Stone Cutting," "Foundations and Concrete Works" ; Bourgeois's "La Coupe des Pierres" (Paris), Hull's "Treatise on Building Stones," Pasley's "Limes and Cements" (Weale), Faija's "Portland Cement for Users" (Lockwood), "Builders' Work," by Seddon, in addition to Rivington's works already mentioned. Looking over the questions set for 1887 in Carpentry and Joinery, there is nothing extraordinarily difficult. In the Honours grade, which is the highest, we find the following question, which may be taken as a sample :—"Draw to a scale of $\frac{1}{2}$in. to a foot, plan and section of an open flight of stairs 3ft. 6in. wide, to rise 12ft. from floor to floor, and having a square landing at a height of 8ft. from the floor ; show carriages, wood panelled soffit, and central line of handrail, the well-hole to be 15in. in clear between the returned nosings."

In the plumbers' work, the questions are pretty searching, and a practical test is given of the candidates' handbook. For all those who are seeking to perfect their technical knowledge of the trades, these examinations offer the student the best opportunity of acquiring a theoretical and practical knowledge of his particular trade.

PIPES AND JOINTS.

ARCHITECTS' specifications are not very explicit about the fixing of vertical and horizontal lines of piping, matters which are considered beneath professional attention and care. These details are left to the builder or the foreman to look after, with the result that in a few weeks or months after the completion of the building inconveniences are suffered owing to leaking of soil or of water pipes. The cast-iron rain-water pipes break away from their connection with the head, or the joints open through the lengths not being firmly held up by proper pipe supports in the walls. What is commoner than to find that the drain pipe or trap has separated from the vertical stack of pipes, causing a leakage of the rain water through the wall? The papering of a room gets irretrievably spoilt or discoloured before the fault is discovered and rectified. A few plain rules are required to be observed in making the joints of cast-iron socket-pipes for drainage purposes, or wherever leakage is to be prevented. One of the best plans is to insert a gasket of picked oakum into the space between the spigot and hub, filling up the space with molten lead. The lead is afterwards consolidated by means of caulking tools, and if done properly a water-tight joint can be made in this manner. To secure iron pipes to a wall various plans are adopted. Iron hooks are generally used to clench the pipe ; but a proper mode of fixing can only be insured by giving each pipe length a solid rest or an iron support let into the wall, to take the socket or hub of each, so that the weight may bear on it. There are now introduced fastenings which keep the pipe a little away from an outer wall, so that in case of overflow from the gutter or head the water runs down the spout, and does not touch the wall. In America expanding conductors are used, so that during freezing weather the seams open and prevent the pipe from bursting. These pipe-fasteners can now be obtained if architects only take the trouble to specify them. In very lofty buildings the contraction and expansion of these pipes ought to be provided for, especially in waste pipes receiving hot water. The failure in the joints often arises from two different kinds of pipe coming together. The joints, for example, between stoneware pipes and iron pipes are seldom found perfect. The use of brass couplings or ferrules is preferable to cement, the iron pipe being securely caulked at the end. The jointing of wrought-iron pipes is best done by screw threads smeared over by a thick paste of red and white lead and boiled oil. For lead pipes wiped or blown joints are used ; the latter if properly done will answer for cold supply between cistern and tank or cylinder.

In iron service piping for gas the runs should be carefully marked, and be as straight as possible, avoiding bends. One of the chief directions to be observed by the gas-fitter is that the pipes should not be laid level, but should have a fall to the main or towards the meter. Every fitter is supposed to know this condition, to avoid the accumulation of condensed vapour in the pipes, and also that every socket and joint should be whiteleaded so as to insure air-tight junctions. Strange to say, however, the modern system of laying pipes is often sadly at fault, and whether it be the sanitary fittings, the water supply, or the gas service, it is not uncommon to find these rules neglected.

CORN-STALK COLUMNS.

ARCHITECTURE in America has been generally credited with having reproduced old works, or, rather, well-known periods ; but a recent writer, Eugene Ashton, has described what are the only truly American columns in existence. They are to be seen in the vestibule of the Capitol at Washington and attributed to Benjamin Henry Latrobe, who succeeded Messrs. Hallett, Hadfield, and Hoban as architect. The columns represent clusters of Indian corn-stalks ; these are so bound that the joints of the stalks form a spiral line round each column. The capitals are composed of ears of maize with half-open husks showing the corn. Writing to Thomas Jefferson, Latrobe thus alludes to his invention : —"I have packed up and sent to Richmond, to be forwarded to Monticello, a box containing the models of the columns to be used for the lower vestibule of the senatorial department of the north wing of the Capitol, which is composed of ears of maize. . . . . These capitals during the summer session obtained me more applause from the members of Congress than all the works of magnitude or difficulty that surround them. They christened them 'corn-cob capitals,' whether for the sake of alliteration, I cannot tell, but certainly not appropriately." It was doubtless owing to the suggestion of Jefferson that native vegetation might be appropriately conventionalised for columnar designs that Latrobe set to work and produced these columns. The writer who refers to these columns observes: "They are a bold stride towards forming for ourselves an ornamentation peculiarly in keeping with our new and vigorous Government. That our buildings have to be supported by Doric, Ionic, and Corinthian columns, unrelieved by anything of our own conception, is strange when we consider the independence of the people of the United States." We may remark in connection with columnar design that the Egyptians in the same manner conventionalised the lotus in their capitals ; the Corinthian capital was, no doubt, a suggestion from the natural acanthus leaves spreading through a basket, as related in the pretty story of its origin ; and the Mediæval artists in the same manner may owe the origin of their beautiful clustered shaft and folial capitals to a cluster of stems and the bursting out of foliage at the top. The first idea, at least, was doubtless suggested by vegetable growth, which the artist conventionalised for his purpose.

LATHING.

ONE of the latest building inventions introduced by our American cousins is the "Eureka Sheathing-lath," a kind of grooved and tongued boarding indented with a series of grooves of dovetail shape, intended to receive the mortar or plaster, and to act as the "key." The combined sheathing and lathing is being employed by the profession, and is meeting, it is said, with favour. No doubt there is less waste of mortar, as the material does not go through as it does between the common fir laths. The labour of lathing is also reduced, as the sheathing lath can be fixed quickly on a wall or ceiling. The wire lathing is now being introduced in many English buildings, and has been largely used in the United States Custom House, Court-house, and post-office buildings. This form of lathing has the advantage of being fireproof ; the plaster clinches on both sides, forming a double surface, and the plastering will not crack. These are certainly advantages.

Princess Louise has promised to visit Nottingham for the purpose of opening the Exhibition of work done at the recreative evening classes throughout the country, on returning from the Continent early in the winter.

WAYSIDE NOTES.

"Le bon temps viendra." When? The lists of tenders are down again: scarcely two columns and a half last week. Seriously we must all hope that Her Majesty's kindly words of encouragement to the bread-winners of the British Empire may rapidly come true, though things certainly do not look very clear on the horizon, especially to the average architect. Even the vast opportunities for building offered by the new streets formed by the Metropolitan Board of Works do not seem to have materially affected the sum of London business. Let us hope more rapid building operations will result from the proposed alterations to Parliament-street.

Tenders are advertised for by the Organising Committee of the Imperial Institute of the United Kingdom, the Colonies, and India. We may therefore expect to be shortly refreshed with some heavy amounts in the columns set apart fer these lists. It is very cheering to take up one's weekly journal and find a goodly array of weighty tenders, running into their hundreds of thousands of pounds; that is, if they be architectural, and not engineering and sewerage matters, as is so frequently the case.

In the matter of cubing: What is the average price per foot cube that an unscrupulous competitor puts on his designs? Assuredly it must often run at as low a figure as 3½d.! Well do I remember how, years back, I entered a competition only, alas! to meet with an opponent who cubed up at 3¾d. about, and won the day. How such persons can subsequently face the building committees is beyond comprehension. When this fellow's tenders came in they were just within a pound or so of our figure, and 30 per cent. above his own. May prosperity follow him just out of reach!

The detailed reports of the inquest at Exeter should be pasted in the architect's newspaper-cutting book. They are curious and instructive, and definitely show how little, with all the chronic talk about the subject, is really done to make our theatres fireproof. It will not be of much use to have certified theatre architects if the law is always to be as lax as at present.

Scores of suggestions are made by persons in every rank as to how to prevent fires in theatres. One says that the masher must not be allowed to smoke his cigarette; another that there should be external staircases, and so *ad infinitum atque ad nauseam*. Meanwhile, those who believe rather in prevention than cure are astonished to learn that there is only one theatre in London, and in the whole country for the matter of that, which possesses an iron curtain!

Recently I inspected a newly-opened building, and carefully examined the whole of the stage and its appliances. Being just completed one would naturally expect to see some attempt at fireproof construction. Not a bit of it. A wooden stage, an open wooden roof over, wooden construction in the flies, and scenes dangling about the gas-burners, which were only protected by a few horizontal wires. Of course there was no iron curtain. It is true there was a "patent" apparatus for flooding the stage; but such fittings, though better than nothing at all, are really but putting the value of *cure* before that of *prevention*.

Now this building is no worse, and, in fact, a good deal better, than most of our theatres and music-halls as regards plan and construction. But does it not seem a scandalous thing that there is no attempt to frame laws sufficiently stringent to compel the construction of properly fireproof theatres? Even in Spain I note that a regulation has been put into force which compels all theatres to be illuminated by the electric light. Electric illumination, fireproof construction, and iron curtains should be a *sine quâ non* if a new theatre is to be opened for the public.

On Sunday last the question of the removal of the block of houses between the Strand and Holywell-street was nearly being settled by fire. There is no doubt that, had the fire spread, it would have saved someone a pulling-down job. There being a good many timber houses, the block does not look as if it would take long to burn down. Few will regret the day when Holywell-street disappears; even the artist, as there are no over-picturesque objects even in that street or the adjoining north side of the Strand.

Mem.: On the south side of the Strand, about opposite the entrance to the Opera Comique, there are some old timber houses that deserve more than a passing glance. A very enthusiastic friend of mine says they are "lovely."

A chancel-arch only 6ft. wide! Why have any at all? At North Witham, in Lincolnshire, the recently restored parish church has only what is practically a doorway between chancel and nave. There is a certain amount of quaintness about such peculiarly small openings of the sacrarium. Examples, however, are few and far between. There is one, I believe, near Brighton. Is it not at the pretty village of Rottingdean, that nestles in the Downs near the coast, that there is an old, round-arched church with a tiny door only between the nave and chancel? I seem to have a recollection of tramping over the Downs to Rottingdean one Sabbath morning, and peeping into its venerable church, and seeing a quaint little chancel arch set some 5ft. or 6ft. above the floor-level of the nave.

I am glad to see that the Norwich Town Council have acquired the old castle, and that in the near future the massive Norman keep, formerly used as a prison, will be used as a museum, or otherwise dedicated to the benefit of the citizens. The castle, being very finely situated on an eminence in the centre, or nearly so, of Norwich, commands a fine view of this exceedingly interesting old city. The site was much too magnificent to waste on the convict class of the community.

Nota Bene.—The visit to-morrow of the A. A. is to a house in Cadogan-square, by Messrs. Ernest George and Peto. Members who enjoy a wealth of quaint composition and powerfully-conceived detail should not fail to join in the tour of inspection.

Another flagrant instance of the manner in which architects are ignored by the public and public Press has come under my notice. Last Monday, a detailed account of the consecration of the new English Church of St. Alban's, at Copenhagen, in a leading daily paper omitted all mention of the name of the architect. Professional men, of course, know all about who is doing this or that, but the public are left in ignorance.

Recently in Scotland (I believe at Edinburgh) a town council employed two individuals, an *architect* and a *builder* (we should say) to inspect some theatre or place of amusement and report as to its condition with regard to fire. In the reports in the papers, however, it was a *builder* and an *architect*!

Who is to blame? The public, the Press, or the architectural profession? On the Continent, especially in France, the architect is an infinitely more honoured personage than he is in England. If there is any report in the daily Press about the opening of new building works, the architect's name is mentioned as a matter of course, while here it is quite the exception. At any rate, no editor of a Parisian paper would put "builder" before "architect."

By the bye, the respectable builder seems nowadays rather prone to assuming the title "contractor" in preference to "builder." Why? Without a doubt, for the reason that he feels he is less liable to be taken for a jerry constructor, and it is greatly to be regretted that the good old word "builder" should be so falling into disuse. When we can snuff out the existence of jerry or demoralised speculating building, we may hope to see the honest church and house contractor assuming the honourable title of "builder" once more. "Carthage *must* be obliterated." "Jerry constructing *must* be annihilated," should be the watchword of the architect and the builder; and I would seriously recommend to the consideration of the promoters of the next R.I.B.A. conference that one of the discussions should be "On the jerry-building disease: its symptoms and predisposing causes, and the possibility of its eradication and cure."

Goth.

SKETCHES AT MESSRS. HALLIDAY'S SHOWROOMS.

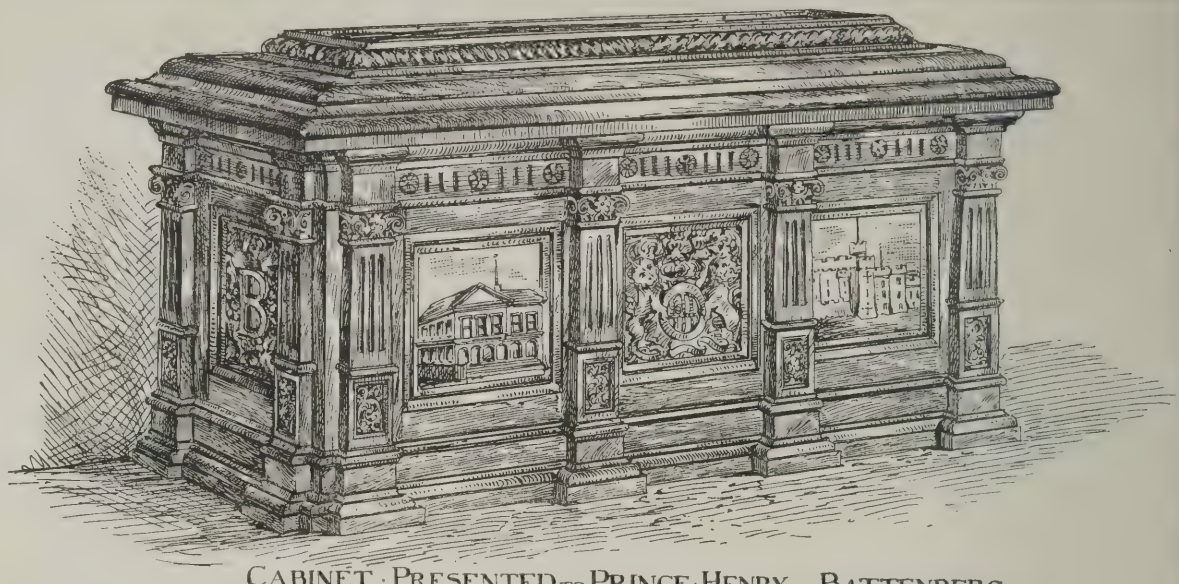
We give illustration this week to a few sketches at the showrooms of the above firm at Eton, who have for some time been appointed art-furniture makers and wood carvers to Her Majesty the Queen, for whom they have lately made the beautiful Cradle shown. It is carved in limewood, and is for the infant Prince Battenberg. It is about 3ft. 2in. long by 2ft. high. The design is partly adopted from an old Florentine cradle. The work is pierced right through, and it is upholstered in red and white silk; the colours of Prince Henry. The work was designed as well as executed by the above firm. The casket shown was made for the Corporation of Windsor and presented to Prince Henry of Battenberg, together with the freedom of the borough. It was carved in brown oak, grown in Windsor forest. The Beatrice Table and Fire-screen combined was made in black walnut; the first having been made for H.R.H. Princess Beatrice. These are a few of the articles lately made by Messrs. Halliday for Her Majesty, and the Royal Family.

BIRTLEY CHURCH.

I send herewith tracing of sketches showing restoration of Birtley Church. The church is very ancient; parts are believed by Canon Greenwell, F.S.A., to be of Saxon date, but they are probably Early Norman—about A.D. 1100. The voussoirs of the arch have the characteristic axe and hatchet dressing in them. Excepting the walls, however, and the chancel arch, nothing save a few stones, crosses, &c., and the old priests' door, are now to be found, as about a century ago the windows, &c., were removed, and square-headed and wood-framed windows, and a plaster ceiling were inserted; these have now, however, been again removed, and the main part of the east end, and the spire and buttresses, &c., are newly built. The beautiful stained-glass windows at the east end are by Messrs. Powell, of London; Mr. William Wilton, of Birtley, was the builder. You will notice there are no windows in the north walls; this is usual in very old North-umbrian churches in exposed positions; the church stands on a hill top, with moorland, &c., around. The chancel tiles are laid by Messrs. W. B. Wilkinson and Co., of Newcastle.

Arthur B. Plummer.

CHIPS.

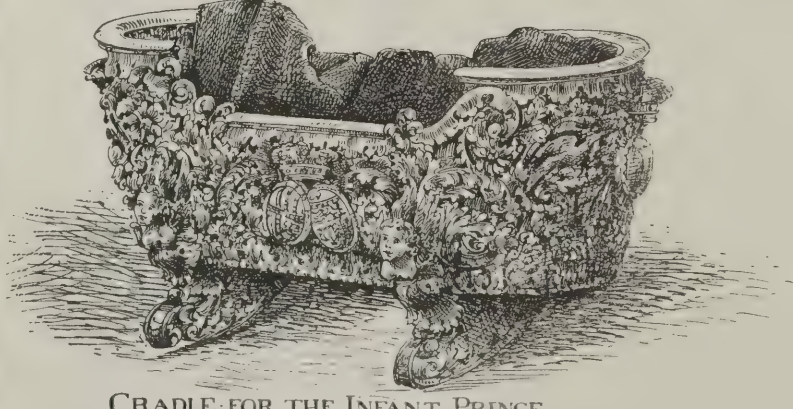


The second annual exhibition of the Southampton Art Society, under the presidency of Major-Gen Lacy, will be opened at the Philharmonic Hall Southampton, on October 12th. The private view will take place on the 11th, when there will also be a conversazione and an address by Mr. G. D Leslie, R.A. A good show of the work of local and other artists is expected, among the forme being pictures from Messrs. Masters and Skeats, o the Ordnance Department, Mr. Drinkwater Butt Mrs. Keary (the authoress), and others.

The chancel windows of Christ Church, Swan nell, Andover, have been recently filled with stained glass from designs by Mr. P. H. Newman of 45, Broadhurst-gardens, to the memory of th late Lieut.-Col. Earle, J.P.

At Upsall, near Thirsk, a new Wesleyan chapel was opened on Friday. It is Gothic in style, seate for 120 persons, and built in local stone with pitch pine fittings. Mr. Thomas Stokes, of Thirsk, w the architect.

St. Paul's Church, Bournemouth, was reopened on Thursday, the 15th inst., after the lengthenin westwards of the nave and north aisle, erection new reredos, and other works. Mr. Parker was th architect, and the work has been carried out b Messrs. George and Harding, at a cost of abo £1,900.



At a meeting of the master plumbers of Man chester, held on Wednesday week, under the cha manship of Mr. J. Jaffrey, a resolution was passe after considerable discussion in favour of th principle of registration for the craft, and a com mittee of twelve practical plumbers was elected t consider the best way of effecting registration.

DESIGN FOR NEW PARISH CHURCH, HAYDOCK, LANCASHIRE.—NORTHERN BANK, BELFAST.—ORGAN LOFT STAIRCASE, ST. MACLOU, ROUEN.—RADFORD BOULEVARD SCHOOLS, NOTTINGHAM.—STABLES, WOOD'S-MEWS, FOR LORD TWEEDMOUTH.—GENERAL POST OFFICE, BRADFORD.

OUR LITHOGRAPHIC ILLUSTRATIONS.

NEW CHURCH, HAYDOCK, LANCASHIRE.

THIS church, illustrated from the drawing exhibited this year at the Royal Academy, was originally designed by the late Mr. George Smith, architect, and is now about being carried out by Messrs. Douglas and Fordham, of Chester. The style adopted is the Early Lancet period, good outline and dignity of effect being considered more suitable for a large colliery district than a style of a more ornate character. The exterior will be of local brick, with stone bands and weatherings, the moulded work for windows, doors, &c., of Ruabon brick. The interior will be plastered. In plan the church consists of nave, with north and south aisles, chancel and vestries. The tower, with slated spire, will be at the west end, and will form the principal entrance. The floors generally will be laid with wood-blocks, the chancel and sacrarium with encaustic tiles. The seats will be of American ash, with shaped elbows and open-framed backs. When completed, it will accommodate 480 adults. The cost will be about £4,000, defrayed by public subscription, and a long-needed church will be provided, and a handsome addition to the buildings of the neighbourhood will be obtained.

NORTHERN BANK BRANCH OFFICE, ROYAL AVENUE, BELFAST.

THIS building, which is in a central position, has been built of a somewhat warm-tinted sandstone from Dungannon in Co. Tyrone. The base is of polished dark grey granite from Castlewellan, Co. Down. The main columns, the jambs and pilasters of doorways, and the large panels between the bank windows are of polished "Shap" granite from Devonshire. The small circular panels are filled with mosaic work by Burke and Co. The building is strictly Classic in its general design and detail, but the features made by the square projecting windows over the entrances, and the bold projection on the sky-line, are very effective, and thoroughly well break up the street frontage, and give the building a light and artistic appearance. Carving of the Renaissance period has been fairly used outside and inside. On the ground floor, almost on the street level, and approached through deeply-recessed doorways, are two vestibules, through which the bank office, which occupies almost the whole of the ground floor, is reached. The walls of this office, and the vestibules and the screens, are all panelled in mahogany; the counter is of the same material, with walnut plinths, and having carved walnut balusters in front. The ceilings are of yellow deal; the cornices, pilasters, columns, &c., are of the Corinthian order, the cusps being carved in sycamore. All this work is half-polished, and the effect is most harmonious and business-like; indeed, the use of such a finish is much to be commended, superseding as it does the ordinary commonplace stucco-work, with its—alas! too often—accessories of vulgar and gaudy painting and so-called decorations. The safes are fitted with double burglar and fireproof doors by Milner and Co., the principal one being bolted at night from the manager's bedroom on the third floor, to which also are electric alarms from the bank doors and safes. On the first floor are the offices of the architect, Mr. Lanyon; and above, on the second and third floors, is the residence (having separate staircase) of the bank manager, and on the attic floor the residence of the bank porter, &c. There is a lift at the rear to all these floors. The floor over bank office is fireproof, Dennett's patent. Minton's tiles are used for the floors of vestibules, bank, and staircase. In a projecting wing at the back are the sanitary arrangements and a ventilating shaft, in which are all the pipes, dust shoot, &c., so arranged that all can easily be got at. The contractors for the work were Messrs. Silo and Matthews, of Belfast.

STAIRCASE TO THE ORGAN-LOFT, ST. MACLOU, ROUEN.

THE well-known church of St. Maclou, at Rouen, is in many respects a remarkable building, and even by the side of the magnificent church of St. Ouen, as also in comparison with Rouen Cathedral, it holds its own in points of interest as well as for the richness of its details and parts, particularly in the interior of the building. The most notable feature in the design externally is the great triple porch at the west end. The doors of these grand portals are especially elaborated with figures and carvings in bas-relief, representing amongst other subjects the Death of the Virgin and the Baptism of Christ. Jean Goujon, of Alençon, the great French sculptor, is said to have carved them. He died "in St. Bartholomew's," 1572. To the right hand of the western doors on entering stands the celebrated circular staircase leading to the organ-loft, which we illustrate to-day from the drawing of Mr. Arnold B. Mitchell. It is a singularly graceful and elegant structure, rich in Flamboyant traceries and sculptures, with figures in the niches and grotesques on the lower ramping string of its beautiful cage. It was erected in 1512.

RADFORD BOULEVARD SCHOOL, NOTTINGHAM.

THESE schools, which have been recently opened, are the last set erected by the Nottingham School Board, and provide accommodation for nearly 1,100 children. The boys' and girls' schools are contained in a two-story building, fronting the Ilkeston-road, with separate approaches from Salisbury-street and Ilkeston-road, while the infants' school fronts the Radford Boulevard, and is only one story high, with a separate entrance in addition to the entrance from Ilkeston-road, which is common to girls and infants. There are two large playgrounds in the rear, each having covered playsheds, one for girls and infants, and the other for boys. The closets and playsheds are so arranged that children from each department can enter them from the school at any time under cover. The schools are built on the class-room principle, having glazed sliding partitions separating all the rooms in each department, and a corridor in the rear communicating with each room. This corridor is only half the height of the classrooms, and between it and the corridor on the first floor is an open arcade into which are windows from the back wall of the lower school, giving cross ventilation to the classrooms. Similar windows over the corridor roof give a back light and cross ventilation to the infants' and girls' school. The schools are warmed by hot-water coils contained in chambers, one in each classroom, through which fresh-warmed air is admitted into the building, the vitiated air being extracted through gratings on the opposite side of the rooms, and carried through underground flues to the large air shaft in the tower, up the centre of which a cast-iron pipe carries off the smoke from the boiler of heating apparatus. This acts as a "teazer," assisting the up-draught in the tower, which in itself is 80ft. high, and a constant change of air in all the classrooms is the result. The schools are built entirely of red bricks, the moulded and ornamental work being made by Wain, of Heather; the roofs are covered with brindled Staffordshire tiles. The internal walls throughout are lined with glazed brickwork to a height of 5ft. from the floor, and above that the walls are neatly faced and pointed and coloured. The classrooms on ground are floored with solid wooden block paving laid on a bed of concrete in a preservative cement which keeps out the damp, and were laid by Mr. Roger L. Lowe, of Farnworth. The schools were built by Mr. C. Baines, of Newark, under the direction of Messrs. T. C. Hine and Son, of Nottingham, architects.

WOOD'S MEWS, PARK LANE, W.

THIS important block of stabling has just been completed for Lord Tweedmouth, from the designs of Mr. John Thomas Wimperis, of 25, Sackville-street, Piccadilly. The stabling has been designed so as to be self-contained, and has been arranged with an inner courtyard, in order that all the work may be done within the entrance gates. In the front are separate stables on either side of the entrance, and ranged round the symmetrical courtyard are two separate coachhouses, separate loose stalls, washing boxes, and harness rooms, while a stable for two horses is reserved for the animals on night duty. On the left of the courtyard is the head coachman's staircase leading to his residence, which overlooks the mews as well as the yard; and on the right is a similar staircase, which leads to the grooms' and helpers' mess-room and sleeping accommodation. The two residences are by this means kept entirely distinct. The towers contain the water store for cleaning, &c., and the fodder lofts, and a clock turret faces the entrance. The principal front is faced with Fareham red bricks and Portland stone dressings, while the courtyard is faced with gault bricks and Portland stone, above a high plinth of glazed bricks. The interior of the stables has been faced entirely with coloured glazed bricks, the pavings being in vitrified yellow clinkers. The fitting-up of the stabling and harness rooms has been entirely carried out by Messrs. Barton and Ballard, of 151, Oxford-street, W., and the general building work has been carried out by Messrs. Holland and Hannen; the carving is by Mr. Anstey.

BRADFORD NEW POST OFFICE.

THIS building has been erected on a site 2,500 yards in extent purchased from the corporation, and is in front of the Parish Church and near the Midland Railway Station. By arrangement with the corporation, the space in front is to be kept open, and is to be formed into a garden. The building has a frontage of upwards of 200ft., and has a private road on the two sides which do not face the streets. The main fronts are of Bolton Wood stone from the best beds, and the back fronts have dressings of the same stone, the walling being from the Heaton quarries. The carving in the spandrels and to the central dormer, which contains a clock with an illuminated dial, has been executed by Mr. W. S. Frith, of London. The roofs are covered with Bangor green slating, with ornamental lead ridging, finials, &c. The wrought and cast iron railing has been executed by Mr. Tomlinson Walker, of York. Public entrance doors have architraves of Shap granite and are of wainscot. The entrance lobbies are faced with stone, and the woodwork is of teak, with pilaster and pediments on the public office side. The latter is 60ft. by 30ft., has a dado of Burmantofts faïence, the walls have pilasters, and the ceiling is panelled and ribbed. At the rear is the sorting office, 155ft. by 32ft. average. In addition to these two offices there are on the ground floor private box and inquiry offices, boys' rooms, also rooms for the postmaster, chief clerk, and medical officer, loading platform with covered cart shed. The letter boxes are under a portico, but there are also boxes in the public office. On the first floor are the instrument room, 86 by 29; telephone room, 32 by 21, with retiring rooms for the male and female clerks approached by separate staircases from the private road, the superintendent's room, &c., and on the second floor are the battery room

(in the centre roof), and rooms for the engineer, mechanics, linesmen, and caretaker. In the basement are stores, retiring rooms for the clerks and postmen, and space for the pneumatic apparatus, gas-engine, &c. The builders are Messrs. Beanland, and the fittings have been supplied by Mr. Elder, of Hayes. The public office, sorting office, and instrument room are lighted by Fourness lamps. The architect is Mr. Henry Tanner, A.R.I.B.A. F.S.I.; and the clerk of works, Mr. Thos. Leake'

THE EFFECT OF FREEZING ON CEMENT.

THE effects of freezing on Portland cement mortar have not been found injurious. In America experiments have shown that masonry laid with Portland cement mortar has stood no ill effects from freezing, while the American natural cement mortars have shown disintegration to a considerable depth from the surface. Mr. Alfred Noble describes the building of piers of the St. Louis River Bridge on the Northern Pacific railroad in the winter of 1884-85. Portland cement was used, the proportions of cement and sand being 1 to 1½ for face stone and 1 to 2½ for backing. During the freezing weather salt was used in the mortar, and the sand was warmed; but the mortar froze with the temperature at 20 degrees on the stone. After some time the mortar was found to have set firmly and as well as that used in the milder weather. Other experiences have confirmed the author's statement. The American natural cements, on the contrary, have been found to disintegrate during frost. The Rosendale cement has, for instance, been proved to weather badly on the surface. But if during the cold weather brine or salt water is used for mixing strong enough, the results have been found satisfactory, even with Rosendale cement, when a large proportion of cement is used. When a strong solution of salt is not used in mixing, the failure of the mortar is almost certain. The proportion of salt necessary may be gathered from the following rule:—Dissolve 1lb. of rock salt in 18 gallons of water when the temperature is 32° Fahr., and add 3oz. of salt for every 3° of lower temperature. The masonry laid with mortar so prepared stood well. Many instances are recorded of the value of using Portland cement in places where the mortar is likely to freeze before setting. The use of salt in cement-mortars also greatly increases their tensile strength under the conditions of freezing. Salt-water is found, indeed, to be as good as fresh for mixing, especially in hydraulic works, though Mr. Faija concludes from experiments he has made that for marine purposes the portions of work below high-water level should be mixed with fresh water, and those above it with sea-water. There is clearly a want of agreement among English authorities upon the point; but if we take the experience of American engineers, the advantages of mixing with salt-water are strongly made out.

EFFECT OF ELECTRIC LIGHT ON BOOKS.

THE *Revue International de l'Electricité* observes that Professor Wiesner, of Vienna, has drawn attention to the discoloration of books in the Technical School library, due to the use of the electric light. A large number of the works have become very yellow, and the director of the school requested Professor Wiesner to ascertain the cause. Experiment has shown that the discoloration is due to the action of light upon the paper containing ligneous substances, such as wood, straw, and jute. When the lignine is removed by chemical means the effect is not produced. The yellowing is said to be due to a phenomenon of oxidation. Ordinary dispersed daylight exerts very slight action, especially in a dry room; on the other hand, the arc-electric light and all intense, luminous sources emit numerous refrangible rays, and these favour the yellowing. The same process of yellowing we know takes place when papers bleached with certain substances are exposed to strong sunlight. The opinions of the professor will rather go to favour gas as the illuminant in libraries.

St. Mary's Roman Catholic Cathedral, Sussex-street, Middlesbrough, was reopened on Sunday, after being redecorated.

BOOKS RECEIVED.

Husbands' Concise Handbook of Measurements in Feet, Inches, and Parts. (Liverpool: Blake and Mackenzie).—This is a most useful compilation for all engaged in building and valuation, especially to glass dealers and merchants, glaziers, timber merchants, stonemasons, and all those engaged in superficial measurements. The accuracy of the calculations can be depended on. The tables range from 2in. to 3ft. 4¾in. in breadth, and from 2ft. to 45¾ft. in length, the fractional ¼, ½, and ¾in. making them of much value in taking glass and any other accurate dimensions. The tables are clearly printed in columns, and form a convenient book for the office and pocket. Mr. E. T. T. Husbands, M.A., late principal of Wallington College, Surrey, is the compiler of these useful tables, which are to be had in sheet form. There is clearly a printer's error in the title page, the author's name being transposed.

CHIPS.

Eccleshill parish church, Sheffield, was reopened on Friday after restoration. Until now the church has had three galleries, with a semicircular front. The north and south galleries have been taken down, but the west gallery has been allowed to remain, and has been re-pewed, and a square front inserted. The box-pews in the nave have been replaced by open pitch-pine stalls varnished, each of which has been supplied with eight footstools of uniform pattern and design. Sitting accommodation is now provided for 800 persons. By the removal of the galleries the lighting of the church has been considerably improved, and the pulpit has been moved further into the chancel. The whole of the interior has been decorated in colour. Mr. George Booth, of Bolton, has been the contractor for the woodwork, and Messrs. B. Harland and Sons, of Bradford, for the painting and decorations. The outlay was £450.

Among the receiving orders granted under the Bankruptcy Act announced in Friday's *Gazette* are the names of W. H. Hulett, Sandmere-road, Clapham; John Walter Cox, James-street, Deptford, late of Abinger-road West, New Cross; John Thomas Mussell, of Plymouth, builders.

A mission church is about to be erected at Abergwgnfi, Glamorgan, from the designs of Messrs. Halliday and Anderson, architects, Cardiff and Llandaff.

Extensive additions are now being made to the Angel Factory, Westbury, Wilts, for Mr. W. H. Laverton, which comprise thirty new rooms, engine, and boiler houses, &c. Messrs. Taylor and Challen, of Birmingham, are the engineers. Messrs. Halliday and Anderson, of cardiff, are the architects.

A new Wesleyan chapel built at a cost of £1,000 was opened at Walkington, near Beverley, on Wednesday week. Mr. W. A. Gelder, M.S.A., of Bowl-alley-lane, Hull, was the architect; and Mr. J. Constable, of Beverley, the builder.

An alms dish, designed by Dean Kitchen's "architect son," and made by five of the choir boys (Masters E. Ashton, A. Ashton, Hayden, E. Newby, and F. Telbury), as a gift to the Dean and Chapter of Winchester, is now completed. It is in repoussé brasswork, the outer border having the words, "Benedicta Sit Sancta Trinitas, 1887." The other portions of the edge are decorated with bosses and conventional renderings of foliage and Tudor flowers, while the entire centre of the dish is occupied by a representation of the Tudor arms of the Chapter, conferred by Henry VIII. It represents, in a Gothic portal, the Holy Trinity, and the shield, which is supported by angels, has in a canton the Tudor rose on a sun in splendour.

A new gasholder, 51ft. in diameter and 20ft. deep, is being constructed at the Neston gasworks, in the Hundred of Wirral. Messrs. Hope, of Liverpool, and Messrs. Deemster, of Manchester, are the contractors.

The city council of York have adopted plans by the city surveyor, Mr. E. G. Mawbey, for alterations at the York Theatre, including the improvement of the means of exit.

New parsonages are being raised for St. Mary's, Nelson-in-Marsden, at a cost of £1,900; for Overton, near Lancaster, at a cost of £1,500; and for St. Andrew's, Livesey, Blackburn, at a cost of £2,825.

A stained-glass window, executed by Messrs. Kempe and Co., of London, has been placed in St. Andrew's Church, Eccles, in memory of the late Mr. Joseph St. John Yates, Judge of County Courts.

A cottage hospital is about to be built at Ashburton from designs by Mr. P. E. Masey, of London, at a cost of about £1,250. Messrs. Roberts and Hurrell, of Plymouth, are the contractors.

Building Intelligence

BIRKENHEAD.—After an interval of thirty five years since the edifice was originally raised the Congregationalists have determined to complete their chapel, at the junction of Oxton road, Ball's-road, and Woodchurch-road. The original plan included a massive tower, and spire that would have been loftier than any in Birkenhead. The plan has been modified, and a lofty pinnacled tower substituted for the spire. The new work, which includes additional buildings, at an estimated total cost of about £2,200 was begun three weeks since. The tower will, when completed, reach a total height of 109ft. from the street level, and as the site itself is one of the most elevated in Birkenhead, the building will be conspicuous on all sides for many miles. The upper portion will have louvred belfry windows. The buttresses will be surmounted by carved and croketted octagonal pinnacles, connected by moulded battlement with a gablet between each pinnacle. The material for facing will be stone from Storeton quarries, similar to the existing work. New school accommodation will be obtained by erecting a single story building to the south end of the church. It will include church parlour 23ft. by 13ft. 6in.; infant classroom 25ft. 6in. by 14ft.; minister's vestry and five classrooms. The front to Woodchurch-road will be faced with Storeton stone. The remainder of the walls will be faced with Buckley buff bricks, relieved by stone dressings. The whole of the buildings are being erected by Messrs. Sinclair Brothers, of Bootle, from plans and under the superintendence of the architect, Mr. Thomas Cubbon, Birkenhead and Douglas.

BLACKBURN.—The guardians of the Blackburn union having decided to erect new offices a competition limited to architects within the union was instituted; Mr. James Hibbert, architect of the Harris Institute, Preston, being appointed to assist the building committee in selecting from the plans sent in. In response to the invitations of the guardians designs were sent in by six different architects. Mr. Hibbert reported strongly in favour of the design submitted by Messrs. Stones and Gradwell, MM.S.A., of Richmond-terrace, Blackburn. The Board unanimously accepted his recommendation; and the buildings are now in course of erection under the superintendence of Messrs. Stones and Gradwell. The total cost will be about £8,000. On the ground floor a large general waiting-room for paupers is provided. Adjoining are four private rooms for the officers, and a serving-room for the storekeeper; two waiting-rooms for relief applicants, and two committee-rooms. The whole of the relief business is kept on one floor. The porter's house is placed at the back. The vestibule of principal entrance leads to a hall and also to the general office for clerks, the clerk's private room, and strong room. A flight of stairs leads to the boardroom, with anteroom, chairman's private room, assessment and rural sanitary authority committee and waiting rooms, guardians' private room, lavatories, &c. The boardroom is lofty, and provides accommodation for 73 guardians, besides officers and reporters. On the second floor six rooms are provided for use as stores and spare offices. The heating is by hot water on the low-pressure system. The ventilation is being carried out by Messrs. Robert Boyle and Sons, on the patent system of vertical tube inlets and patent air-pump extractors. Each department is separated by distinct shafts and extract ventilators. The front and return façades are of dressed stone, the remainder of brickwork with stone dressings. Glazed bricks have been freely used both for interior and exterior walls. The whole of the floors are to be fireproof. The work is being carried out by local contractors.

BRADFORD.—A new Roman Catholic Church of St. Joseph, Packington-street, Manchester-road, Bradford, was dedicated on Friday. The whole edifice is expected to cost £10,000, of which one-half has been raised. The architect is Mr. Edward Simpson, of Manningham, Bradford. The building comprises nave and aisles, with double transepts and chancel, with side chapels and organ chamber opening from the chancel. At the west end of the nave

aisle is a baptistery, and at the same end of the south aisles is the foundation for a tower. The style adopted is Early Decorated. The roof is 60ft. above the ground, and is of open-timbered construction, supported on arched principals, having cross-braced rafters filled in with tracery work and panels. The seats, roof, and flooring are of pitch pine. The passages are laid with mosaic marble pavement, and the chancel is floored with pitch pine and walnut parquetry. The columns are constructed of red Cumberland sandstone, and the arches and stonework are of local ashlar. The altar is by Mr. Wall, of Cheltenham. It is of alabaster. In the centre panel is to be carved a representation of the "Agony in the Garden." The reredos is diapered, and the wings are filled in with traceried panels, terminating in niches and canopies.

GARTON-IN-HOLDERNESS.—The church of St. Michael, Garton-in-Holderness, was reopened this week after reparation. The work done has consisted of the repairing and cleaning of the whole of the masonry in the interior of the fabric; this has been most carefully executed, in order that the character of the old work should be in no way impaired. A new 15th-century window has been inserted at the east end of the chancel, and on the north side of the nave and west end of the tower other windows corresponding with it. The nave has been reseated with open benches, free from stains or varnish; and stalls and prayer desk, of oak, are placed in the chancel. The pulpit is of a rich character, executed in various shades of Ancaster stone. The chancel floor is paved with encaustic tiles, and that of the nave with small, plain red tiles. The ancient rood screen has been carefully repaired and refixed in its old position. A screen has also been placed under the arch to the vestry. The several works have been executed from the designs and under the superintendence of Messrs. Smith and Brodrick, of Hull, architects. The general contract has been carried out by Messrs. Simpson and Malone, of Hull, and the screen work by Mr. Elwell, of Beverley.

KIMBERLEY (THE DIAMOND FIELDS), S.A.—The restoration of the Kimberley Club House, referred to in our issue of the 11th February of this year, has been completed. The expenditure, not including furniture, has been over £9,000. Externally it is a plain square red brick building, with a teak verandah and balcony 10ft. wide carried round the principal façades. This is divided into bays of 15ft. by heavy square columns arranged in couples. The verandah has been erected in teak at £800 less than the estimate for iron. Internally, more consideration has been given to architectural effect, and a polychromatic treatment has been adopted. The contract has been carried out by Messrs. C. R. Jones and Chas. Cole, from designs by Mr. Sydney Stent, M.Inst.C.E., F.R.I.B.A. The lavatory fittings are from Jennings's works, of Lambeth, S.E.; the tiles from Minton and Maw and Co.; Moules supplied the earth closets; and Horwood, of Frome, the glazing. The ironmongery was from Gardener and Sons, of Bristol; and Boyle's air exhausts are used in combination with vertical inlet flues for ventilation.

KILBURN.—The church of St. Paul, at Kilburn, N.W., has lately been undergoing considerable alterations and repair, and has just been reopened on completion. The building is one of the would-be Classic style, in stucco, and the paucity of funds has prevented the committee from undertaking more than the decoration of the existing surface of the walls. The alterations consist of new floors throughout the body of church, new open seats of pitch-pine in lieu of the old high pews, a new window in chancel, and the extension of Keith's heating system. The whole of the walls have been painted, and some portions decorated, while the ceiling of nave has been entirely renewed. The works, at a cost of about £930, have been executed by Mr. R. A. Yerbury, of Kilburn, from the plans and under the direction of Mr. Alexander N. Hansell, of 62, Basinghall-street, architect.

NORTH RUNCTON.—The parish church of North Runcton, near Lynn, was reopened on Wednesday week after restoration. The church is the only one in the Italian style in Norfolk, and was built in the 18th century on the site of the Mediæval church, destroyed by the fall of the tower in 1701, the old material being utilised as far as possible. The present works have been carried out from plans by Mr. Herbert J. Green, of Norwich, by Messrs. Storey and Thurston, of North Walsham. The whole of the internal fittings of the church and of the chancel, including the three galleries, have been removed; the timber of the roof has been put into good condition, and the roof covered with red tiles. The ceilings, which are flat, with a central dome, supported by four Ionic pillars, have been repaired, and the ornaments and mouldings reworked. The internal walls have been replastered, and the external plastering placed in proper order. The old window frames were removed and new ones substituted, the openings being filled with cathedral glass in geometrical patterns; it is intended to fill these openings with stained glass. The old wooden reredos has been preserved, and the old memorial slabs have been relaid in the floor. The chief feature in the restoration is the formation of three arches opening from the nave into the chancel. All the passages and the floor of sacrarium are paved with red, grey, and black mosaic marble, and the space under the seats is covered with noiseless wood blocks. The old pews have been replaced with oak open benches; the pulpit, lectern, choir seats, and reading-desk are also of oak and carved. The doorways in the north and south porches have been blocked up, and both porches are now used as vestries. Near a new west entrance is the marble font formerly used in St. Margaret's church, Lynn, and presented by that parish at a public meeting to North Runcton.

OVER WINCHENDON, BUCKS.—On Tuesday week was reopened the interesting little church of Over Winchendon, near Aylesbury, after renovation under Mr. William White, F.S.A. The chancel is of the period of Transition from Norman, with two lancet windows in the east gable, and a corbel between them inside, with the stringcourse mitred round it, on which was placed perhaps the image of a saint, or, more likely, a rood. There is a pointed chancel arch of simple, or rather, of rude construction, and a screen of later date against which new oak "return stalls" have been fixed. It is within memory that the wooden steps to the rood loft remained. The nave is of Norman date, and in its south wall is a richly moulded doorway, and one simple window, of Norman date, with a recessed arch inside. The timber porch has been reconstructed as before, but without the plastering. The north door has been opened out. The north aisle is of 14th century date, the windows having flowing tracery. The aisle opens from the nave with two round arches, and one pointed, with flat soffits and large rectangular piers, evidently cut through the old wall. The chancel fittings are of oak. The old altar and altar rails have been reused, somewhat altered. Some Mediæval benches have been refixed at the west end. The other benches are made up in deal; they stand on floors of wood block. The passages and the chancel are laid with the old slabs, one containing a good brass made up with tiles.

WATFORD.—A new Baptist chapel is being built at the corner of Derby and Grosvenor-roads. The plan internally is a Latin cross, the dimensions of which are 60ft. by 50ft., the main body being about 30ft. wide, and consisting of six bays. Three of these will be arcaded, opening on to the gabled aisles which forms the arms of the cross. At the eastern end, and separated from the nave by a pointed arch 24ft. in width, will be placed an elevated rostrum, having in front the baptistery for immersions. There are two vestries, each 14ft. square, and capable of being used as one room, a minister's vestry, and other accommodation. On either side of the chief porch, that to Derby-road, will stand a conical-roofed tower between 50ft. and 60ft. high, affording accommodation for the fire-proof staircases leading to the gallery. The nave, baptistery, and rostrum will be under one open-timbered, hammer-beam roof. The structure will be essentially a brick one, with internal linings of yellow stocks, and external linings of grey Franklin stocks from Laverstock Green, both relieved by red brick dressings. All the roofs will be covered with tiles and plain red cresting. The warming will be by hot water, and the ventilation by Tobin's tubes, and three of Kershaw's exhaust ventilators executed in copper. Yellow deal and pitch-pine are the materials selected for the seating, and red pine will be sparingly introduced in the open panelled work of rostrum and gallery fronts. The chapel will accommodate 420 adults, the side galleries raising that number to 500. A free treament of Early English has been selected as the style. The architect is Mr. W. H. Syme, A.R.I.B.A., of Watford, and the works are being executed by Messrs. Judge and Eames, under a contract amounting to £2,000.

COMPETITIONS.

KINGSWINFORD, STAFFORDSHIRE.—In the competition for the new schools at Mount Pleasant, Quarry Bank, Brierley Hill, for the Kingswinford School Board, the board have accepted the design submitted by Messrs. G. B. Nichols and Son, of 59, Colmore-row, Birmingham, and have given them instructions to at once proceed with the contract drawings.

LEIGHTON.—In response to the Leighton Jubilee Celebration Committee's advertisement for designs for a public drinking-fountain, four have been received, and at a meeting of the committee held on Friday last, that submitted by Mr. J. Sloan, architect, of Linsdale, was unanimously accepted, provided that the necessary funds can be raised.

CHIPS.

Mr. G. Sedger, of London, has been appointed architect for the proposed technical school for Stockport, which will be built on the estate.

The death is announced, at the age of 76 years, of Mr. John Gibson, architect, for the past 40 years of Malton, but formerly of Scarborough, where in his earlier years he was in business as a builder. He laid out the estate, designed, and carried out the buildings of the South Cliff Company, including the esplanade. For some years after leaving Scarborough, he was borough surveyor of Malton, and until his death held the office of professional adviser to Earl Fitzwilliam.

A meeting of the Doncaster town council in committee was held on Tuesday for the purpose of appointing a borough surveyor at a salary of £250 a year. Five candidates appeared before the council, and on a final division being taken Mr. Crabtree, engineer, Rotherham, and Mr. Duff, assistant surveyor of Doncaster, received an equal number of votes, when the Mayor gave his casting vote in favour of Mr. Crabtree.

The annual exhibition of the works of local and other artists, held by the Ryde Art Society, under the presidency of Sir William Levinge, Bart., will open on Sept. 28th, when Mr. Drinkwater Butt will act as judge in the competition classes. A good show is expected.

At the last meeting of the Senate of Sydney University, New South Wales, Mr. John Sulman, F.R.I.B.A., of Sydney, and late of London, was appointed Lecturer in Architecture, and a sum of £100 was voted for architectural diagrams and drawings. There were seven candidates for the appointment.

St. Mary's Church, Wavertree, Liverpool, has just been completed by the erection of a spire as a memorial to the late Mr. Hugh Hornby. The first section of the church, the nave and south aisle, was built in 1854, and the last, the tower, five years ago. The spire now added is built of Woolton and Runcorn stone, and is exactly 100ft. high, making the total height from the ground to the top of the cross 174ft. It is divided by two bands into three main stages, and has in each stage a tier of gabled lights. The work has been executed by Mr. Thomas Foxcroft, of Liverpool, from designs and under the supervision of Messrs. W. and J. Hay, architects, of the same city.

The work connected with the restoration of Stratford-on-Avon parish church, which involves an estimated outlay of £12,000, has been advanced another stage. It was announced on Friday that the committee have accepted Messrs. Bodley and Garner's plans for the removal of the organ from the north transept to the gallery placed above the tower arch, at the east end of the nave, at an estimated cost of £2,000. A new organ case and screen will be provided.

An advertisement in the daily papers announces that Mr. Ernest Claude Lee, architect, of No. 30, Great James-street, Bedford-row, and of Teddington, will adopt the prefix of Ayton, formerly his family name, as an addition to his surname of Lee.

Engineering Notes.

Bradford.—The Midland new station and hotel are now making good progress having been in hand three years. The station and hotel are being erected from plans prepared by Mr. T. Trubshaw, the architect to the company, and the contract is held by Messrs. Brown and Sons, of Salford. The main front of the premises, the design of which is Renaissance in charater, will be in Kirkgate, and in length it will measure 300ft. The front of the hotel buildings and offices, whose length will be 176ft., will be in Cheapside; the hotel itself, which will be five stories in height and will contain sixty bedrooms, being situate at the corner of Cheapside and Kirkgate, and facing both thoroughfares. This portion of the work is being pushed forward, and the workmen are now engaged on the second story. The walls of the building are being constructed of ashlar, with brick backing, the stone being obtained from local quarries. The main feature of the Kirkgate frontage will be an octagonal tower, springing from a square porch, and surmounted by a dome and finial. In front of the principal windows, which will be two-light, there will be balconies, guarded by balustrades. The building will have a Mansard roof. Immediately within the entrance will be a large hall, measuring 33ft. square, and corridors leading right and left. Off the corridors there will be lavatories, manager's staircase, office, bar, restaurant and service-room, smoke and billiard rooms, &c. On the first floor will be coffee-room, service-rooms, still-rooms, and smoke-rooms, &c. The next floor will be occupied by 25 bedrooms and bath-rooms, the third floor will be similarly planned, and the kitchen is on the fourth floor. The new station will have an internal width of 170ft. There will be a cross platform 80ft. in width, and to the right of this there will be the usual waiting-rooms, the refreshment-rooms and hotel buildings being to the left. Within the area will be offices for station-master, clerks, and these will command a view of the three platforms, each 32ft. in width, and more than 500ft. in length. The platform on the Cheapside or outgoing side of the station will measure 200ft. in length, the rest being 450ft. long. Rapid progress is being made with the second half of the Exchange Station (Lancashire and Yorkshire and Great Northern). It will be practically a counterpart of the new portion at present in use, except that on the Drake-street side there will be a suite of offices, &c. It is expected that the station will be completed early next year.

The Ribble Navigation Works.—Mr. Sykes, the newly-appointed engineer of the Ribble Navigation Improvement Works, in place of his partner, Mr. E. Garlick, who resigned on account of ill-health, has just issued a report in which it is stated that the Parliamentary estimate of the cost of the works was £558,000; that the borrowing powers of the Corporation of Preston for their construction was £662,000; that the total estimated cost as being and recommended to be carried out will be £1,171,000, and that therefore a further sum of £509,000 will be required for the completion of the undertaking. The Ribble committee have announced that at the next town council meeting they will recommend that an application be made for sanction to borrow an additional sum of £510,000.

A reredos recently erected in the newly-restored parish church of St. Mary's, Bickington, near Ashburton, has just been completed by the introduction of some sculpture from the chisel of Mr. Harry Hems, of Exeter. These additions were unveiled at the harvest festival on Thursday, Sept. 17. The reredos itself was made by Mr. Hems, having been designed by Mr. R. Medley Fulford, F.R.I.B.A., M.S.A., by whom the church was restored in 1884. It is made entirely of English oak, and the new sculpture is all in the same material. The subject in the central panel is the "Nativity," and in the side niches and beneath canopies are angels in various attitudes of adoration.

The recently-published report of the Parliamentary Committee on Public Accounts states that in future Mr. Clutton and Mr. Gore, receivers, will receive commission on the net rents, and not on the gross receipts as heretofore.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 6d. (or 7dols. 30c. gold). To France or Belgium, £1 9s. 2d. (or 22fr. 90c.). To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 16s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 6d. per line of Eight words, the first line counting as two, the minimum charge being 4s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 3s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are printed up. A few second volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

RECEIVED.—H. S. and Co.—A. L. Co.—J. H. M.—H. S.—J. K. and Co.—L. G. I. Co.—J. L.—W. P. B.—A. W.—J. H. T.

H. B. WARNE. ("Merrett's "Land and Engineering Surveying" is an old and valued work, and the examples and plates are of importance to the student; but for a beginner we should recommend the "Treatise on Surveying," by T. Baker, published in Weale's series, price 2s. The mathematical portion of the former work is rather too-lengthy and laborious; but if E. C. W. begins at Part II. and follows each problem up by referring to examples, he will soon be able to master the subject.)

Correspondence.

THE YORK MEETING OF THE SOCIETY OF ARCHITECTS.

To the Editor of the BUILDING NEWS.

Sir,—Would you permit us to call the attention of your readers to the fact that the Society of Architects intend paying a visit to York during the first week in October in conjunction with the York Architectural Association?

All architects are invited to attend the visits and meetings, full particulars of which can be obtained on application to the undersigned.—We are, &c.,

EDGAR FARMAN, Hon. Sec.
G. A. T. MIDDLETON, Sec.

St. James's Hall, Piccadilly, London, W.,
September 22.

Sir,—During the visit of the Society of Architects to York, at the invitation of the York Architectural Association, there are to be several interesting meetings for the discussion of subjects of architectural interest. The importance of one of these meetings in particular I would draw the attention of your readers to—viz., that set down for Monday, the 3rd October, at 7.30 o'clock, at which the question of the proposed Architects' and Engineers' Registration Act is to be discussed.

The opportunity thus afforded to those architects practising in the North of England of discussing this important subject should not be missed; and it is hoped that all who can will attend.—I am, &c.,

EDGAR FARMAN,
Hon. Sec. Architects' and Engineers' Registration Act Committee.

99, King-street, Cheapside, E.C., London,
September 21.

FIRES IN THEATRES.

Sir,—The letters which have appeared in your columns refer to future improvements upon the *buildings*, but as a great part of the loss of life occurs from the *conduct of the audience*, something might be done at once in all theatres to prevent those present losing first their presence of mind, and then their lives through crushing to all get out at once. I would suggest that in all theatres it be made imperative to fix up a number of instructions, printed in large letters, to the effect that in case of alarm from any cause the audience are to *avoid crushing*, which will enable them all to get out much more quickly, while the ladies are to lift the tails of their dresses high enough not to be trampled on, in order to prevent them being dragged down. With intimations such as I refer to prominently put up in sufficient numbers in all theatres, both presence of mind and chivalry might take the place of senseless panic, and so many lives might be saved and much after evil prevented.

Crushing of a most shamefully selfish kind sometimes takes place at the entrance of theatres, &c., when some popular actor or speaker is to appear. We had a disgraceful specimen of this here on the 9th inst., when it took about thirty-five minutes for two or three hundred people to get into the theatre owing to the crushing, whereas had there been no crushing they might all have got in in from five to seven minutes. In this case ladies were fainting, and strong men looking as if they had been fixing a steamer in the Red Sea. It is generally the outside people who crush those before them. The police ought to be empowered to stop this.—I am, &c.,

PRO BONO PUBLICO.

Glasgow, Sept. 16.

CHURCH RESTORATION.

Sir,—I have heard so much about the "careful" restoration of Chester Cathedral by the late Sir Gilbert Scott that, on a recent visit there, I expected to find only necessary work done. Such, however, is not the case.

When the restoration was commenced there were no flying buttresses on either side of the nave. The piers between the clerestory windows on the north are weak, and bulge outwards considerably. Here flying buttresses are absolutely necessary for the preservation of the building; but because the north side is greatly hidden by buildings and trees, and the south exposed to view, the latter, which did not require strengthening because the piers are thicker, is given flying buttresses and made handsome, while the former is left to itself.—I am, &c.,

CHARLES F. MOXON.

Beach Cliff, Westgate-on-Sea.

FOREMEN OF MASONS.

Sir,—Occasionally in your journal and contemporary appear advertisements for first-class foremen of masons. Now, in the case where the advertiser is an employer who is credited with having in his employ a staff of first-class masons, is it an unreasonable question to ask, Could not the ranks of the staff be sought through for a foreman? Is it just to the men, some of whom may be capable and worthy of the position, for a stranger to be brought into their midst?

In my experience, I have always found in any average mason's shop one or two, or more sometimes, of the men quite capable of discharging a foreman's duty.—I am, &c.,

Sept. 17. BANKER HAND.

A NOVEL CRANE.

Sir,—A paragraph in your issue of yesterday, copied from the *Scotsman*, describes a crane in use at South Bruntsfield-place, Edinburgh, as a "novelty."

This is far from being the case, and I will describe, in almost the same words, a crane I used in the erection of Colston Hall, Bristol 16 years since, when carrying out that work

for Mr. James Diment, of that city, the then head of the firm, now known as Stephens and Bastow, of Bristol and London.

It consisted of a derrick crane (with 60ft. jib) and a mortar mill, worked simultaneously by a single engine. The crane was elevated in the usual fashion on a timber scaffolding at a considerable height above the engine, which stood on an iron bogie upon the ground. The chain led up from the winding barrel through a hole in the base of the crane, and thence over the top across pulleys for the purpose of hoisting the jib and materials. The mortar mill stood some distance from the engine, and was of the ordinary type, driven by a belt attached to a special pulley on the engine.

Mr. Diment's own engineer from the woodworking machinery shop made the patterns and fitted up the crane; but I am not aware that he claimed to be the originator of this duplex action, which overcame the necessity of the employment of two engines, &c., &c. See paragraph referred to, page 459.—I am, &c.,

S. B. BURTON.

16, Ridley Villas, Newcastle-on-Tyne,
Sept. 17.

THE ITALIAN MARBLE TRADE.

SIR,—The following figures may be of interest to your readers. They represent the gross production of Italian marbles from the quarries at Carrara and Massa, the total exportation to all countries, and the amount and value exported to British ports during the past seven years:—

	Production. Tons.	Exportation. Tons.
18[illegible]	154 277	131,571
18[illegible]	159,169	122,305
18[illegible]	168,565	157,969
18[illegible]	173,582	127,251
18[illegible]	175,773	142,133
1886	168,942	152,445
1886	156,058	161,543

TOTAL EXPORTATION TO BRITISH PORTS.

	Tons.	Value.
18[illegible]	16,[illegible]	£[illegible]
18[illegible]	14,[illegible]	114,161
1882	20,427	137,872
18[illegible]	17,[illegible]	124,[illegible]
1884	20,097	132,918
1885	18,648	116,224
1886	20,336	122,646

—I am, &c.,

ARTHUR LEE.

Canon's Marsh, Bristol, Sept. 20.

CHIPS.

A new church is about to be consecrated by the Bishop of Manchester at Longton, Lancs. It provides sittings for 520 worshippers, and has cost, including site, £5,455.

The Plymouth board of guardians have instructed Mr. H. J. Snell, of that town, to prepare plans for the gradual reconstruction of the workhouse, the first section to be carried out being measures for the addition of fireproof staircases to the lunacy wards.

A new theatre is approaching completion in Heath-street, Crewe, from plans by Mr. Alfred Darbishire, of Manchester. Mr. George Cawdrey is to carry out the construction of the stage, flies, and paint room, which are to be exceptionally complete for a provincial theatre.

A building at Wickham Market, Suffolk, formerly used as the town hall, has been acquired by a local court of Foresters, and was reopened last week after enlargement and improvement. The works have been carried out by Mr. H. Dale, of Wickham Market.

A bronze statue to Dr. Agostino Bertani, surgeon-in-chief to Garibaldi's expeditionary corps in the Italian wars of independence, is to be erected at Milan. The sculptor is Vela, of the canton Ticino.

The tower and spire and peal of eight bells just added to St. Paul's Church, Wood-green, near Wednesbury, were consecrated by the Bishop of Lichfield on Saturday. Mr. E. F. C. Clarke was the architect, Mr. Willock, of Wolverhampton, the builder, and Messrs. Taylor, of Loughborough, were the founders. We illustrated the tower in our issue of Jan. 21 of the present year, and the church itself, built from the same architect's designs, in our issue of April 5, 1872.

A bas-relief in Carrara marble has been recently found in a tomb in the Via Portuensis at Rome. It represents a nude youth defending himself from two women, each clothed in a short chiton and himation. According to Luigi Borsari, it portrays the fate of Pentheus, who was torn to pieces by Mænads for reviling the Bacchic mysteries.

Intercommunication.

QUESTIONS.

[9399.]—**Quantities.**—Prof. Kerr read an important paper last session before the R.I.B.A. on "The Architect's Functions in Building Contracts." In the discussion which followed, a great difference of opinion was expressed with reference to the quantities forming part of the contract. I should be very glad of replies to the following questions:—1. Why do many architects object to the quantities forming the basis of the contract? If the builder bases his tender upon the quantities, is it fair dealing, or is it common sense to exclude them from the contract, and to ignore them after the contract is signed? 2. On what grounds is the assertion made, "If the quantities form part of the contract, the quantity surveyor is absolved from all liability for errors"? If I am not mistaken, in law all men are liable for negligence and incompetency in the exercise of their profession, and my contention is that whether the quantities form part of the contract or not, the amount of the surveyor's liability is precisely the same, although the person to whom he is liable may not be the same. The extent of his liability must be in proportion to the extent of his shortcomings, and cannot depend upon arbitrary exclusion of the quantities from a contract to which he is not a party. 3. Assuming that the quantities are excluded from the contract, what legal decisions have been given establishing the principle that the quantity surveyor must pay to the builder, out of his own pocket, the amount of any deficiencies? 4. Again, assuming that the quantities are not in the contract, to whom is the surveyor responsible in the event of excessive quantities? It must not be forgotten that the low-class or incompetent surveyor is much more likely to err on the side of excess than on the side of deficiency. It is easy enough with a stroke of the pen to weight quantities to any extent, and there is no check upon abuses of this kind; certainly the builder will say nothing about them. Excessive quantities are much more serious to the proprietor for this reason, that he pays money for nothing at all. For example, if the value of the excesses amounts to £500, he pays that sum and receives absolutely no consideration whatever. If, on the other hand, the quantities are deficient to the same extent, at the worst he only pays £500 more than he expected to pay, and he gets his money's worth. A discussion on the points raised by these questions will be interesting to many readers of the BUILDING NEWS, and a reply from authorities, like Mr. Banister Fletcher, would be of great value.—SURVEYOR.

[9400.]—**Acoustics.**—In a church with a high-pitched roof the sound of the preacher's voice carries so badly that most of the sermon is lost. Is there any remedy, or, at least, mitigation of the evil? Can any correspondent give the name and date of an article in one of the monthlies on the acoustics of the Albert Hall, London, and the plan there adopted successfully?—E. M. J.

[9401.]—**An Architect in a Fix.**—May I ask through your paper if any of your readers were ever in such a fix as this? A client of mine wished to build two pairs of houses at about £2,000 each pair, and he asked me to prepare the drawings and specification, and get tenders from builders, which I did, to the satisfaction of all concerned. When the first pair were ready for the roof the owner gave me a letter, in which he said that he would be his own architect for the second pair. Accordingly he told the builder to begin them in accordance with his contract and my drawings and specifications, thus simply copying in the second pair what was done by me in the first pair. The whole position is to me painfully ludicrous, more especially as he refuses to pay one penny on the second pair. If this is brought before a judge he will rule according to the usages of the profession, I presume. May I ask you or any of your readers to give me their opinion as to the case?—A. B. C.

[9402.]—**Dark Oak Stain.**—Could any of your readers recommend me a good dark oak stain for white pine, and oblige?—SCOTUS.

[9403.]—**Half-Timbered Work.**—Would any kind reader give me his experience as to the best cement for finishing, or skim coat for panel work? I have arranged for grounds or foundation coat, the best Portland cement, and wish to know what cement is best to use for finishing coat so as to leave all perfectly smooth and paintable?—J. H. D.

[9404.]—**Royal Engineer Department Examination for Assistant Surveyor.**—I should be glad if any reader would oblige me with a list of the best books on the following subjects in relation to the above exam.?—1. Theory of Construction; 2. Strength and quality of materials, and description of workmanship, tools, and plant; 3. Analysis of prices.—G. W. C.

[9405.]—**English Manor Houses.**—Would anyone kindly inform me which are the twenty or thirty most important English manor houses to students of architecture, or in other words, what are the houses that are to England what the following are to France?—Chambard, Blois, Chaumont, Pierrefonds, Le Lud, Maintenon, Loches, Azi-le-Rideau, Cour-Cheverny, Valency, Chenanceaux, Amboine, Versailles, Fontainebleau, Chateau d'Usse, Chantilly, Montresor, Serront, Montrail, Bellay, Brissac, Chateau d'Eau, &c.? One more question: What work best illustrates the English Houses?—A STUDENT OF ARCHITECTURE.

[9406.]—**Paint for Hot-Water Pipes.**—I have to paint some hot-water pipes which are exposed to view. Would any reader please inform me what paint would be most suitable for the purpose?—PAINTER.

[9407.]—**Specification not Agreeing with Quantities.**—When work is described in the specification, but not in quantities, can the contractor be justly asked to execute such work, although there is no clause in the specification to that effect?—ENQUIRER.

[9408.]—**Architectural Perspectives.**—Are arches, &c., in perspective generally inked in by curves? If so, are the ordinary French curves used? Some draughtsmen seem to use a slightly jagged or indented straight edge for the sake of picturesqueness. Is this so? Any practical hints on this subject would be welcome to—A LEARNER.

[9409.]—**Warehouses.**—Will some reader experienced in the Metropolitan Building Acts kindly say—1. If shops with dwelling-rooms over come within the definition of the "warehouse class," and explain where the line is drawn? 2. If a building as mentioned above could have a Mansard roof with a pitch of over 47° to cover the domestic rooms. 3. Are there any regulations in force respecting cranes over public thoroughfares?—R. J. BEALE.

[9410.]—**Concrete Floors.**—Will some readers of this paper kindly send answer to the following questions next week? A corridor leading to a mission hall is about 22ft. long by 6ft. wide. The floor is composed of cement concrete 8in. thick, in some places rather more. The concrete forms a slab resting partly on set-offs in the wall on either side, and partly on a projecting curve of bull-nose brick. The corridor may at times be full of people, moving either to or from the hall. Do my fellow-readers consider this construction quite safe? If not, what remedy do they recommend?—CAUTIOUS.

[9411.]—**Flue Linings or Tubes of Glazed Fireclay.**—These I understand are given to cracking where subjected to much heat or pressure, whilst unglazed fireclay pipes are free from same. Can anyone give me information on these points?—TOLOP.

[9412.]—**The Eyesight.**—I venture to bring this subject before your readers, believing that it is a matter of vast importance to the architectural profession, and hoping that by so doing we shall be able to obtain some advice, of value to all draughtsmen, as to the proper means of protecting the eyesight, of restoring it when affected, of preserving it, and also of the best method of getting as much work out of those important members—the eyes—without doing them a permanent injury. Of late I have heard of numerous architects and draughtsmen who have been obliged to give up work for lengthened periods, and have even been compelled to spend the greater part of the day in a dark room because their eyesight has begun to give way through the great strain brought to bear upon them. I have lately felt it somewhat myself, though up to last winter my eyesight never failed me in the least. Then, being busy on some competition work (work which has doubtless many things to answer for besides this) and for several weeks, my eyes being forced to bear the glare of white paper continuously for many hours of the day, and then also for several hours of the night, by gaslight, I found that towards the end, on looking at the paper, all lines seemed to run into one another. My eyes at once commenced to stare as though at some point far beyond, and every detail was rendered obscure. As to putting in any minute work, it was totally impossible until I obtained a pair of "smoked glasses," which shut out the intense glare of the paper to a large extent. I still find the effects of this strain on the eyesight if for any lengthened period my eyes are brought to bear continuously on white paper, and I, and no doubt many more sufferers, will be thankful to any one who can suggest any remedy, or give any suggestion as to the proper means of preserving and strengthening the eyesight. The advice of any medical friends who are authorities on this subject will especially be acceptable.—VEDRA.

REPLIES.

[9334.]—**Half-Timbered Work.**—There are no special works on this subject that I am aware of; but a few general remarks may serve "Iona's" purpose. The old builders did not fill in with brick and plastered over; they used wattle and plaster, and the best modern substitute is double lath and London Portland cement, finished flush with the timbers. On no account let the timbers project; it is a mistaken notion. If brick filling-in is used, let it be flush, and not plastered over, and arrange the timbers so as to avoid closers and cut bricks. If the ordinary whole or half bricks will not suit, have them made the proper size by hand, and not pressed. By the same rule the timbers should be framed from the saw, and not wrought, and the oak pins cut off to project ¼in. from face. The wood should have several coats of Stockholm tar and no paint. It is a fact not generally known that timbers exposed to the weather are more durable if unwrought than wrought and painted. The first coat of plaster should be half and half good hair mortar, and London Portland cement (White's or Nine Elms); second coat, Portland cement and clean washed sand; and last coat left floated face, with white-washed sand. The cement should be spread out on a floor to cool for about a week before using. If "Iona's" will state if he wishes to fill-in with brick or plaster, I may help him by sketches.—JAMES THORNELOE.

[9286.]—**Railway Gauges.**—The general gauge of Russia in Europe is 5ft. (having been chosen to put obstacles in the way of invasion from Western Europe). There may be a few narrow-gauge exceptions, but I can give no particulars about them. The Central Asian lines I believe are also 5ft. gauge; but of them also I have no particulars. The Trans-Caspian was originally laid down on some very narrow gauge, but has since, I believe, been altered to Standard. There are two principal gauges in India, the broad, or Standard, of 5ft. 6in., and the metre, of 3ft. 3⅜in. The Standard gauge comprises all the main lines of communication with the exception of the Rajputana-Malwa system, a question of whose alteration to Standard gauge is now under consideration. The Standard gauge, open and working on the 31st March, 1886, comprised 7,583 miles, or 61¼ per cent. of the whole. The metre gauge on the same date comprised 4,552¾ miles, or 36¾ per cent. There were also 127¾ miles of 2ft. 6in. gauge, 80½ of 2ft. gauge, and 27¾ of 4ft. gauge, total, 12,376 miles. If "An Engineer" will get the admirable "Administration Report Bluebook on Indian Railways" for 1886-7 (price about 2s. 6d.), which will be out in a week or two's time, he will find in it all he can want to know.—BROAD GAUGE.

[9397.]—**Exam. for Assistant Surveyor, Civil Service.**—"A Candidate" can inspect specimen examination papers by calling on me by appointment. Subjects, examiners, and conditions are constantly being changed. At one time, "water supply," "levelling and chain surveying," and "applied chemistry" were among the subjects for competition. Previous to this year, civil engineers' assistants were not allowed to compete. On the other hand, surveyors' assistants are not now eligible. Admiralty candidates have two extra compulsory subjects

this year. The preliminary examination lasts one day (about four hours), and the competitive takes seven days (about 42 hours). London, Edinburgh, Bristol, Leeds, and Shanghai are the Office of Works stations to which assistant surveyors may be sent. Chatham, Devonport, Gosport, Pembroke, and Portsmouth are the outposts at which Admiralty draughtsmen may be stationed. I shall be glad at any time to answer queries which readers of the BUILDING NEWS may address to me.—J. R. SMITH, 22, Salcott-road, near Battersea Rise.

STAINED GLASS.

DUNDEE.—Messrs. Barnett and Sons, glass stainers, Leith, have just completed for St. Joseph's Roman Catholic Church, Dundee, a memorial window. It is formed by a triplet of lancets, and above these a circular light, in which is represented a dove hovering over the group of figures below. The latter consists of the Virgin with the infant Jesus in her arms, and in the side lights sitting and kneeling figures of saints. In the side lights are representations of St. Anna, St. Joseph, St. John, and St. Dominic. These are flanked by two smaller lancets containing figures of St. Andrew and St. Patrick.

THE ENGLISH CHURCH AT COPENHAGEN.—The stained glass windows in the chancel have been presented by Sir Francis Cook, and the west windows by his Excellency the Hon. Sir Edmund Monson, K.C.M.G., Her Majesty's Minister in Denmark, the whole work being by Messrs. Heaton, Butler, and Bayne, of Garrick-street, London.

ST. ALBAN'S CATHEDRAL.—A new memorial window has just been completed in the south side of the ante-chapel to the Lady-chapel, in memory of Jane Elizabeth Gape, aunt of Major Gape, who died in the year 1872. The window has been fixed by Messrs. Burlison and Grylls, of Newman-street, Oxford-street, and it is a two-light window with an upper light, and bears large figures and groups, representing St. Margaret and St. Catherine, and the parable of the Foolish Virgins. A memorial window of stained glass is to be fitted by the same firm in the opposite angle of that part of the chapel.

WANGFORD.—The old parish church at Wangford, Suffolk, has lately been restored, and a four-light west window erected, to the memory of the late Earl of Stradbroke, by the members of his family. The window represents "Our Saviour driving the money-changers and those who bought and sold doves from the Temple," in the left-hand light, while the two centre openings are occupied by the subject of "Solomon building the Temple," and the fourth light represent "The bringing back of the Ark to the Temple by the Priests." These three subjects are surmounted by Perpendicular canopies, having in each case a corresponding base. There is some very intricate and imposing tracery, in which floating angels bearing shields, with the "Alpha" and "Omega" and emblems of the four Evangelists, form the principal part. The window was designed and executed by Messrs. Gibbs and Howard, 64, Charlotte-street, Fitzroy-square, London, under the superintendence of Mr. E. P. Blackburn, architect, of Winchester.

LEGAL INTELLIGENCE.

IN RE C. J. C. PAWLEY.—A first meeting in this case was made on Sept. 15 before Mr. Wildy, assistant receiver. The receiving order was made upon a creditor's petition, the debtor being described as of 26, Moorgate-street, City, and now or late of Sydenham, architect and surveyor; and it appeared that he had been engaged in speculative building. The unsecured liabilities were stated in the accounts at £6,983, and debts fully secured £80,080; assets £65. It was stated that the Court had made an order for summary administration, and the debtor had been adjudged bankrupt. No offer was made, and the creditors left the matter in the hands of the Official Receiver.

On Saturday the remains of Mr. George Fawcett, builder and contractor, Quarry House, Teale-street, Wakefield, who died suddenly on the previous Wednesday, were interred at the Wakefield Cemetery. The funeral was of a public character. The procession included the Borough Police and Fire Brigade, about half of the members of the Corporation, with which the deceased gentleman had been connected for nearly nine years, and the members of the Wakefield Master Builders' Association.

The Dover Harbour Board have decided to employ Messrs. Lucas and Aird to widen the Wellington Bridge and gateway 10ft., at a cost of about £20,000.

A public park, 11 acres in extent, was opened at Peebles on Saturday by Sir J. A. Hay, by whom the site has been severed from Kingsmeadows Park and presented to the townspeople.

WATER SUPPLY AND SANITARY MATTERS.

COUNTY DOWN UNITED DISTRICT WATER SCHEME.—A scheme of considerable magnitude is in preparation for affording a supply of water to a number of towns in Down and Armagh. Mr. Henry Smyth and Mr. Macassey are the engineers engaged, and they have selected Slieve Croob Mountain, near Ballynahinch, as the source of the proposed supply. The water will be collected on the southern slopes of the mountain, and then stored in large reservoirs. The latter will be situated at the level of some 900ft. above sea-level, from whence distributing pipes will convey the water to the different towns joining in the scheme. Each town will have its own service reservoir, into which its share of the supply will be passed. The towns to be joined in the undertaking include Ballynahinch, Downpatrick, Crossgar, Dromore, Banbridge, Lurgan, and Portadown, and the villages situated on the lines of pipes.

HORSFORTH, LEEDS.—A third reservoir has been constructed for the supply of this town, and will be brought into use very shortly. It covers seven acres of land, and it has been constructed from plans prepared by Messrs. McLandsborough and Preston, engineers, by Mr. John Brigg, of Bingley, and has cost about £2,000, exclusive of land and fence-walling. It will hold eight million gallons, the storage capacity of the three reservoirs being 18 million gallons. It is also proposed to raise the embankment of the middle reservoir 6ft. The land for this purpose has been purchased, and the preliminary work of removing the fence-walls, weir, and by-wash has commenced. This will increase the storage capacity eight million gallons, making a total of 26 million gallons in all. While constructing the new reservoir a spring of good water was tapped, which yields 5,000 gallons per day. The new filter beds, which have been constructed at a cost of £2,000, are now in full working order, and are calculated to pass off 150,000 gallons per day.

MANCHESTER.—The present water supply to Manchester from Longdendale, and the works in progress in connection with the Thirlemere Lake scheme, are described from official sources in a handbook recently published. The cost of the waterworks at Longdendale is put down at £2,600,863, and that of the old company's works at £533,561, making a total of £3,134,424. Supply of water, 1886, 19,464,597 gallons per day. Area of drainage ground, about 19,300 statute acres, or 30 square miles. Distance of Manchester from Woodhead reservoir, 18 miles. Population supplied, about one million. Consumption equal to 20 gallons per head per day for all purposes. Area of district supplied, 84 square miles, comprising 34 townships. Compensation water, a quantity equal to 59 cubic feet per second for 12 hours of every working day, divided by arrangement with the millowners into about 16,800,000 gallons for the first five working days of the week, and 11,000,000 on a Saturday. New works in course of construction at Lake Thirlemere, Cumberland:—Elevation, 533ft. above Ordnance datum; area of drainage ground, 11,000 statute acres; present area of lake, 328¼ acres; area when raised, 793 acres; contents when raised, 1,300,000,000 cubic feet, estimated to supply 50,000,000 gallons per day; tunnels and aqueduct for supplying water to Manchester, 7ft. diameter; gradient, 20in. per mile; total length, 95 miles; estimated cost of works, £3,424,530. The powers to construct these works were obtained under the 42nd Vic. cap. 36 (23rd May, 1879), after two severe Parliamentary struggles. The total area of the reservoirs amounts to 154½ acres, and the total storage capacity 5,985,000,000 gallons.

East Huntspill Church has been reopened, after extensive alterations, a sermon being preached by the Bishop of Bath and Wells. The edifice was erected in 1838, and is in the phase of Norman then in vogue. It consists of a chancel and nave, and is without a tower. The gallery at the west end of the church has been removed, and the organ has been re-erected on the north side of chancel, in an organ chamber; the chancel enlarged, and a new vestry constructed on the north side. All the work has been carried out with stone from Puriton. The architect was Mr. Hans F. Price, of Weston-super-Mare, and the contractor was Mr H. W. Pollard, of Bridgwater.

A new Presbyterian church in the Crescent at Belfast was opened last week. It has been built by Messrs. Fitzpatrick, of Belfast, from designs by Mr. Wilson, of Glasgow.

The plan for the new Eden Theatre, to be erected in the King's-road, Brighton, were passed by the local board last week, and the work will be commenced in a few days. The building will be practically fireproof, and provided with ample exits. Some special features will be introduced in the construction by the architect, Mr. Frank Matcham, of 3, Great James-street, London, W.C.

STATUES, MEMORIALS, &c.

UPTON PYNE.—The restoration of Upton Pyne Church has just been completed by the erection of a reredos and superaltar. The reredos, designed by Mr. R. Medley Fulford, M.S.A., to frame a valuable altarpiece brought from Italy 170 years ago by Mr. Hugh Stafford, of Pynes, and presented to the church, formed part of the plan of restoration, and the Dowager Countess of Iddesleigh has had it carried out as a memorial of her late husband. The reredos is of carved oak and walnut, the super-altar of Corsehill stone, surmounted by a slab of Devonshire marble. The work has been executed by Messrs. Luscombe, of Exeter. The painting in the reredos is a representation of Our Lord's Supper, and it has been carefully restored by Mr. Worth, of Exeter. In the churchyard over the vault of the late Lord Iddesleigh a memorial cross has been erected. The cross, like the three massive steps on which it stands, is of white marble; the arms and head have crosslet terminations with moulded margins; in the extremity of each limb is a raised Greek cross, and in the centre the sacred monogram X P, while on the base of the stem is represented an Ionic capital bearing a Greek lamp. On the principal front of the surbase is the inscription in bold Roman capitals, "Sir Stafford Henry Northcote, first Earl of Iddesleigh," and on the sides are other inscriptions. The cross has been executed from designs by Mr. J. Jerman, of Exeter, by Mr. Harry Hems, of the same city.

CHIPS.

Professor Vischer, the eminent German art critic, died at Gmünden on Wednesday evening, in his eighty-first year.

Mr. H. E. Armstrong, medical officer of health of Newcastle-on-Tyne, describes, in an interesting letter published in a Newcastle daily paper, a model dwelling which has been erected in the Royal Jubilee Exhibition of that town. The dwelling, which is detached, is built with materials and appliances which have been presented by different exhibitors. The house has been planned by Mr. R. J. Leeson, and consists of four rooms on each floor, which with the offices are well arranged. The building will remain permanently after the Exhibition is over.

The awards of the jurors at the Adelaide Jubilee Exhibition were completed on the 14th instant. Of the 237 British exhibitors 93 have secured recognition in the shape of medals and certificates. Among those who receive gold medals are the following:—Art pottery, Doulton and Co., London; mosaics, Minton, Stoke-on-Trent; pens, Gillow, Birmingham; carriages, Morgan and Co., London; alkalies, Brunner.

Mr. William Ray, now of the Yorkshire College, Leeds, has been elected headmaster of the School of Science and Art, Kidderminster, and the architect of the school buildings, Mr. Getting, has been directed by the committee to obtain tenders for fitting up and furnishing them.

The Congregational chapel at Needham Market was reopened last week after having been renovated from plans by Mr. A. Pells, of Beccles. The church was originally founded in the year 1662 by the Rev. John Fairfax, M.A., who was ejected from Barking; and the present chapel (the third built in Needham since the church was founded) was opened in November, 1837. A lecture hall has been thrown into the chapel; all the ground floor of the building has been reseated with pitch-pine benches, and a new pulpit, standing on a platform, has been erected, while the hot-water pipes have been laid in the passages. The whole chapel has been re-coloured and re-painted under the direction of Mr. F. Blomfield, of Needham, while the other part of the work was carried out by Messrs. Theobald and Sons, of Needham. The cost amounts to £360.

The Royal Jubilee Hall, Weymouth, has just been completed and licensed for theatrical performances. It has cost £6,000, and is 140ft. long by 90ft. in width; the height from floor to roof in the centre is 51ft., and to the wall plates 32ft. Messrs. Crickmay and Sons, of Westminster and Weymouth, are the architects, and Mr. G. R. Crickmay, in giving evidence before the magistrates, said every attention had been paid to the entrances and means of exit. He regarded the place as absolutely fireproof, being constructed of brick and iron.

Referring to our notice in our issue of the 16th inst. of the restoration of St. Leonard's Church, Walford, from plans by Messrs. Nicholson and Son, Hereford, we should have said the floors were laid in Lowe's patent system of wood-block flooring.

The memorial stones of a new Wesleyan chapel, to be known as St. Levan's, was laid on Tuesday at Pennycomequick, near Plymouth. Mr. Trenaman, Stuart-road, Plymouth, is the contractor, and the cost will be about £1,000.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1708.
FRIDAY, SEPTEMBER 30, 1887.

THE BUILDING HANDICRAFTS.—I.

IN the early days of architecture, the building artificer and artist craftsman contributed their share to the development of the art; in truth, it was more from within that the art grew than from external influences; but if we compare the action of our modern craftsmen, we shall find very little growth takes place in this way, as their work is controlled by external circumstances. Instead of being operative artists they have become mere instruments in the hands of the general contractor. We must bear these altered circumstances in view in estimating the influence of the various trades upon architecture; how far each can be said to have improved or otherwise, and to what extent modern architecture is indebted to the building operative. And if we were asked which of the trades had done the most for the art in recent times we should be inclined to answer, taking the order of them in building—the bricklayer, the carpenter and joiner, the engineer, the plumber, the plasterer, and decorator. What about the mason? There are excellent masons, no doubt,—some of them equally skilled with those of old who reared the arcades and vaults of Amiens, of Salisbury, and the elaborate fan vaults of Gloucester, King's College Chapel, and Henry VII.'s Chapel; but they are few, and their services are now fallen to a discount. In the roofing to our churches and schools the mason has been seriously supplanted by the carpenter and plasterer. In fact, the work which raised the mason to the highest point of geometrical and artistic skill, and the art of masonry to a high pitch of perfection in the arts, is very seldom required. Not 15 per cent. of our modern churches are vaulted with stone, and very few of them exhibit the elaboration and intricacy of stone-cutting which was found some years ago. So of masonry we must say that the art and craft have fallen greatly from their once high estate, due largely to the diminution of buildings requiring the highest skill in the masonic arts. Moreover, the brick-cutter and setter has, in many districts, to a considerable extent superseded the stone mason, and the trade of bricklaying has immensely risen during the revival of brick architecture. It will be evident that, in both the cases of the mason and bricklayer, the rise or decline of the art and the craft has depended a good deal on the material used and the locality. Better masons were to be found in the Southern and Eastern districts of England fifty years ago than now, and better plasterers than bricklayers. And why? Because at that time stone was more generally used for churches than brick, and stucco was more common than brick. The use of a material will, therefore, always have a great deal to do with the position of the craftsman, as has been the case in manufacturing industries. Even in such matters as ladies' fabrics, we know how much depends on the materials in fashion; we know that some industries have completely died out owing to the disuse of the material upon which they depended, or its being superseded by another. The employment of a particular material led, of course, in time to the exercise of skill upon it, and experts or schools of craftsmen followed in every district. Let us take, for example, the masonry of the Eastern Counties—the "flush work," as it is called, of Norfolk and Suffolk, where flint is introduced in panels formed of stonework. The masons learned this combination so perfectly that it became a beautiful feature in the porches and parapets of their buildings, as we notice in the fine churches of Long Melford, Eye, and Woodbridge, in Suffolk, and we have mainly to notice that it was the abundance of flints in these localities that led the masons there to the invention of this beautiful flint panel work in their walling. So, again, turning to the magnificent roofs, rood screens, and bench ends to be found in this part of England. We can only account for the perfection in them by the carpenters and carvers having formed guilds and devoting themselves to the perfection of woodwork. The same development in this branch is to be noticed in Devonshire and Somerset, where many churches have roofs carved and painted like those of Norfolk and Suffolk, and where remarkably fine carved screens are to be found, as in the church of Wrington. In Somerset the masons and carvers appear to have been remarkably proficient. The stone-cutting of the grand towers of Wrington and St. Cuthbert, Wells, among many more, display much elaboration and scientific skill, notably in the grouping of pinnacles and in the intricate stone-cutting of the angles of the towers. In short, the student of local peculiarities cannot fail to mark that wherever there has been a school of masons, of wood-workers, or of carvers, there has been an unrestricted supply of good stone or wood. But we cannot expect to find skilled artists in any materials, when every few years the taste changes, and we turn from stone to brick, and from brick to stucco. Change of style has been inimical to development such as we are considering, as it supposes a revulsion or drawing back from all that we had done previously, and working artists are not prepared to unlearn what they have acquired, and to begin to be taught new modes and details of work. Such was the case when Gothic succeeded Italian, and "Queen Anne" the Gothic. In the historic periods the change was gradually brought about, owing to the foreign artists who came over, as during the age of Elizabeth and the later days of Charles II. The Stuarts, indeed, encouraged foreign artists, and the workmen were instructed in new modes of working. But there was something stronger than foreign influence: there was the individual unfolding of ideas which the earlier guilds promoted in every locality; the apprentice was instructed in the "mystery" of his craft, and learned to become a proficient in it; he was not restricted as to time or material, and was permitted to exercise his own talents. In this manner invention was encouraged, a new stage was entered upon, and expressed itself outwardly. As we have said, the growth was from within outwards, not as now—a forcing process by which all, except the architect, become mere tools.

But to take each trade in the order we have named them, and first the bricklayer. We have said he has superseded in some districts the mason. During the last ten or fifteen years the bricklayer has recovered his somewhat fallen condition under the reign of "compo." We see examples of brickwork now which equal the brick architecture of the Tudors and the Dutch of the 17th century. Owing to the taste and labours of Mr. Norman Shaw, Messrs. Ernest George and Peto, Mr. John L. Pearson, R.A., and Mr. A. Waterhouse, R.A., amongst modern architects, ornamental brickwork in England has made great strides. The "Queen Anne" craze, to its credit, has restored the reputation once enjoyed by our brick-cutters and setters, and we need not go far to point out in London some fine examples of modern workmanship that worthily compare with the Flemish. Italian, Gothic led the way. Mr. John L. Pearson, R.A., in his fine church of St. Augustine's, Kilburn, and St. John's, Upper Norwood, has shown what can be done by modern hands in brick groin vaulting. At the recent Architectural and Building Trades Exhibition at Islington we noticed some excellent rubbed and carved brickwork, executed by T. Lawrence, of Bracknell; we also see red brick houses at Kensington, designed by Mr. J. J. Stevenson and Messrs. George and Peto, which are masterpieces of the bricklayers' and the brick-cutters' arts. Yet not long ago, the English bricklayer was looked upon as occupying not a very important position in the building fraternity, and, in fact, only a little above a hodsman. His attainments were then measured by the operation of laying bricks. But the skilled bricklayer is a great deal more than a layer of bricks. His knowledge of practical geometry should be not less extensive than the mason's if he understands the method of setting out such things as oblique arches, groined vaults, gauged arches, niches, &c. This setting out has been generally intrusted to foremen and clerks of works, though there is every reason why the operative should know the principles, especially if he desires to raise himself amongst his fellows. The drawing and cutting of arches, the taking off the bevels and moulds for an arch on a circle, require at least intelligence, and when to these things we add a knowledge of architectural features and ornament, it will be easily seen that the superior operative in this department should possess attainments as respectable as those of the mason.

He should particularly welcome the efforts made to raise the handicraft by the establishment of classes for apprentices, such as those of the City and Guilds of London Institute. The opportunity will be lost to him later in life. It is for the workman alone to raise himself to the position of an artist in the material he works with, and till he earnestly sets this ideal before him, the contractor will continue to use him as a mere tool. An accomplished bricklayer or mason is intrusted with a great deal of the architectural design; he should be able to second the architect's efforts, and, if necessary, be competent to suggest modifications and improved details as the work advances. Very few do anything of the kind; they simply execute orders as expeditiously and thoughtlessly as they can—they have no interest to do more. But taking the trade all round, we may say there are indications of more intelligent interest and higher artistic culture in the craft. To be a successful worker in brickwork, a man ought to have some knowledge of art, to have a correct eye, to understand technical drawings, and to know when a thing looks well and what to do to increase its effect. Without he knows this he is only a bungler.

The art of the modern carpenter and joiner holds, it must be confessed, an inferior place to that of his predecessors. Triumphs of the carpenters' art, such as we meet with in the noble roofs of Westminster Hall, the Great Hall of Hampton Court, Eltham Hall in Kent, and in the beautiful examples of hammer-beam roofs in the old churches of Norfolk and Suffolk, are no longer to be met with. Iron has seriously interfered with the greater constructive feats of the carpenter; while his artistic skill has very little scope left under the modern contracting system of dividing labour. The old carpenter, although his scientific construction was not always perfect, produced works of art; his eye and hand were cultivated, and expressed themselves on the work he did. Machinery has lightened his labour; but without, alas! increasing the artistic cultivation of the worker. Though he has less drudgery to perform, he has not benefited; the hand and eye are no longer associated,

and a marked separation of the artist and operative has taken place. We can explain it on no other assumption than that labour-saving machinery has benefited only one class, and has taken away from the craftsman the means he had before of developing his skill and exhibiting his art. Things are done piecemeal; the capitalist only reaps the benefit. In this trade also, therefore, as in that of the mason, development from within has been impaired. The highest class of joinery to be found nowadays is in the hands of a very few men, who do the best church work, and are located in the principal towns. They contract for fittings. The skilled village or journeyman carpenter is now no longer met with. The consequence of these things is that the carpenter and joiner is no longer associated with building, except as an independent factor in its production, and contributes very little of his head and heart to the work. The recent statistics published on the depression of the building trades show two main causes of depression in this trade: the importation of manufactured materials and joinery, and speculative building. Reckless speculation is, we believe, the bottom of the trouble, as it draws into competition with skilled hands the inferior workman. But we still look to the carpenter and joiner. His labour constitutes a very considerable and important part of architecture, and the influence of the carpenter on architecture will always be felt. The Carpenters' Company, by providing technical instruction and free lectures, and exhibitions of handicraft, is recovering lost would ground, if only the London apprentices take advantage of them. Again, let not the youth believe he can do without apprenticeship. In London the apprenticeship system is dying out, and the market is being flooded with unskilled workmen. With unskilled joiners, architectural detail must need suffer, and when internal finish deteriorates, the exterior architecture becomes neglected. To masonry and joinery belong the essential part of architecture, and for the credit of art we must preserve them from falling into merely mechanical operations.

BUILDING LAW ADMINISTRATION.

THE irregularity with which the machinery of the law is found to work is one of the grievances of the public. If it is not a blunder or omission on the part of those vested with authority to carry out laws, it may be a dereliction of duty of a more reprehensible kind. The laws in force which concern the architect and builder are few and fragmentary; they are directed to insure the objects of safe and sanitary buildings, and they are supposed to be administered by authorities who are fully versed in the statute book, and who cannot go wrong. Unfortunately, there is no guarantee that these objects are attained. As we are repeatedly reminded, local control may be perfect in theory, but is anything but satisfactory in practice. With divided authorities there is a source of danger as well. Let us take as an example the statute law relating to building in the Metropolis. The application of the Acts, the rules for construction, regulations as to the line and height of buildings, the by-laws as to alterations of buildings not constructed in agreement with them, the regulations of structure of theatres and music-halls, the erection of buildings for dangerous or noxious businesses, are among the statutes in operation. These provisions are on the whole very fairly put into force by the existing administrators of the Acts; the districts are large but are well looked after by the surveyors, and the members elected by the respective vestries and district boards in the Metropolis are supposed to know the requirements of their several localities. But though the machinery is in good working order, there are occasions when the builder has not found it difficult to evade the law in the substitution of inferior materials and workmanship, and even in the carrying out of objectionable arrangements.

More cause for complaint, however, exists in the administration of the law in other towns, where, unfortunately, the web of old and modern legislation is no easy matter to unravel. Early in this century many towns obtained Improvement Acts, and the Public Health Act of 1848 was passed, which applied to the whole country. This Act was supplemented by various special Acts, till in 1871 the Local Government Board was constituted, with powers to control the local authorities; and the Public Health Act of 1875 was passed, sweeping away many local Acts, which by this time had become very troublesome and vexatious. The tangled web of legislation in sanitary matters is even now a source of bewilderment and difficulty in carrying out the intentions of the Legislature. It must be said, too, that the qualifications of members and mode of election of local boards are not all that can be desired to insure the carrying out of regulations of public importance. The members constituting urban authorities are usually property holders, often of a class of buildings which are not models of sanitary arrangement or good construction; and the same remark applies more forcibly to the guardians of the poor, who are owners of property in the rural districts. To qualify them as elective guardians they are to be owners or occupiers of property. Some time since we reported a glaring instance of neglect to provide sufficient closets to a house—the owner of the property being a member of the local authority. The regulations respecting lodging houses are perfect, but are being constantly evaded, owing to the diffidence of surveyors in putting into force rules against members of their boards. How many districts have the by-laws in force respecting houses let in lodgings? Just now, when many seaside towns are full of visitors, attention to certain rules are of urgent importance. For example, there is a by-law which can be put into force by the urban sanitary authority for any district, for fixing the number of persons who may occupy a house, or part of a house, which is let as lodgings. Is this salutary rule followed at Brighton, Hastings, Margate, or any of our popular resorts? Are houses so let registered or inspected; and, above all, we should like to know how many of them are provided with proper closet accommodation and ventilation? The fact is apparent that the local authority is often asleep when it ought to be on the alert, and that the section in the Act which empowers them to make inspections of their district to ascertain nuisances and to abate them is a dead-letter. In large towns like Manchester and Salford the Sanitary Acts have as yet done little to remove the close courts and alleys and the back-to-back houses, to which Dr. Ransome, in his address on consumption at the Sanitary Institute last week, attributed nearly all the phthisical cases in those parts. All borough surveyors are aware of the responsible and onerous duty cast upon them by Section 160 of the Public Health Act, which empowers them to act immediately upon the discovery of any "building, wall, or anything affixed thereon," being in a ruinous or dangerous state, and enables them after giving three days' notice to make complaint before justices, and order the owner or occupier "to take down, rebuild, repair, or otherwise secure," the same. This provision is found in the Towns Improvement Clauses Act, 1847, and is incorporated in the Public Health Act. So with respect to the previous sections, 158 and 159, of that Act, which give power to the urban authority to exercise their authority in cases of rebuilding or the erection of "new" buildings. Surveyors do not like to act upon their sole responsibility—they are, in point of fact, not willing to offend large property-holders, and the consequence is that old and dilapidated structures remain which are dangerous to the public. The borough surveyor has generally to attend to a multiplicity of daily duties, and it is often impossible for him to see that the 99 clauses of the by-laws of the Local Government Board have been enforced. The general opinion of the borough surveyors is that the machinery of administration—the inspection of buildings—is at present completely inadequate to cope with the actual demands. Inspectors of buildings, sanitary and constructive, are not half numerous enough in the larger towns and districts.

We have lately had a very painful experience in the case of fires, both in theatres and houses, of the very unsatisfactory state of local action. The Exeter Theatre calamity is a case in point. There was plenty of legislation, but no one to see that the rules were carried into effect. The authority in that city intrusted with the protection of the public declined even to be represented at the coroner's court. The urban authority are vested with certain powers to make by-laws, but in regard to theatres they are practically without a voice. Plans have to be deposited with them for permission to erect a building, but not to obtain a licence. The regulations of the Metropolitan Board of Works require that every person desirous of opening a place of public resort for the performance of stage plays must give notice to the licensing authority, which notice must be accompanied by plans, drawings, and specifications, the number of persons accommodated in the different parts of the house, and of the area to be assigned to each; they further require that the proscenium wall is to be of brick, not less than 13in. in thickness, 3ft. above the roof. Other local authorities have no authority to enforce these regulations, for, as we find in the evidence, the proscenium wall was only 9in. thick under the stage, the doors in the wall for the orchestra were of wood; while, worse still, the stairs leading from the foyer to the upper circle, the top landing on the entrance to gallery, and the passages round the upper circle and dress-circle boxes were of wood. The evidence will show other departures from these rules, especially as regards the all-important question of exits. The Act of Parliament for the licensing of theatres is an authority of general application. The justices have an assumed power to attach to their license the regulations of the Lord Chamberlain. The statute was passed in 1843, and, as the coroner said, does not limit the power of the justices. But the questions that occur are: Who makes the rules for the regulation of local theatres, and how are they enforced? The Exeter theatre furnishes the answer. It was given in evidence that the rules were prepared by the committee and approved by the justices. The statutory duty of inspection, according to one witness, was not the duty of the magistrates, but of the town council, whereas the city surveyor declared he was solely the custodian of the plans, and not the adviser of the justices. The latter contended that the construction and safety of the building devolved on the town council, and the justices' rules related only to the internal management, a division of duty which accords with the jurisdiction exercised by the Metropolitan Board of Works and the Lord Chamberlain, the latter of whom supervises the internal management. In short, this case furnishes us with a striking instance of the uncertainty which exists in the minds of local authorities as to their precise duties. The magistrates evidently thought the town council was the authority in respect of construction, and therefore did not con-

sider they were to be held responsible. While it is clear there is nothing which requires the justices to make rules, it is reasonable to think the urban authority should possess the requisite power to regulate entrances and exits. The by-laws of towns are chiefly directed to ordinary buildings and to sanitary measures; they are quite inadequate to provide means of ingress and egress to public buildings, and the enforcement of any rules is not clear. We certainly think it time that the Legislature should invest the urban authority with the necessary powers to act in all these and similar cases.

The licensing of buildings for special purposes is a question that must be taken up more thoroughly than it has been. We have now a variety of buildings erected for business and commercial purposes, for recreation and amusement. If a building is erected for a block of offices it should be so licensed, the owner or lessee being held responsible if the premises are let or applied to any other purpose for which it was not designed—if, for example, it should be converted into a factory or store. Premises intended for shops ought to be licensed as such, certain rules being required as to the number of bedrooms that should be allowed within the given area, a condition being that separate entrances and exits should be provided, and that on no account should the upper floors be divided into tenements. Public buildings ought in like manner to be classed and placed under control, the number of entrances and exits being proportioned according to a fixed scale on the number admitted. It would be easy and practicable to devise a code of rules that would apply to every description of building. The too easy conversion of buildings erected for one purpose and used for another would be checked by these regulations, and the licensing would carry with it an authoritative guarantee of the fitness of each structure, which deposit of plan and very uncertain inspections during the progress of erection so often fail to afford the public.

OUR WORKING MEN AND WHAT THEY MAY DO.

IT must needs seem to very many not a little surprising, when carefully thought about, that in a great manufacturing country like this, and in one in which the "fustian jackets" are always and everywhere at work and visible, that so little opportunity has ever—if at all—been given them to publicly exhibit, and to individually show to the world, each one's special aptitude for the work he does, whether by himself or in concert with others. It would be not a little difficult to find perhaps in a day's walk through London town any one single object which could fairly be evidenced as the handiwork of *one* man, and as thus showing what he, as a workman, can do. It is, indeed, surprising to find how little the outer world knows, or can know, of what its individual members are fully capable of, and what amount of mental, we will not say poetic, impression or imaginative power they each one of them can put before the eyes of the outer and non-professional world. Yet more surprising is it to find how impossible it is to do this from the want hitherto of any public institution which might be supposed to exist purposely for such work, and for which but so very few, if any, can provide for themselves. If this should be at all difficult of apprehension, it will certainly cease to be so, and will become evident enough, after the visits made to the late Chelsea Industrial Exhibition, where a series of works of all kinds were to be seen under conditions and opportunities somewhat new and hardly to have been anticipated; and now that this has somewhat too rapidly come to a close, we would for a moment take a lesson from it, imperfect as such may be.

We but venture a word or so about it, and that but generally, for there having been no catalogue, it is a little difficult to point to specialities; but this is the less to be regretted here, as it is on the main idea of the whole display that we would venture a word or two, now that the trial has been made, though only, as we trust, to be revived in the next year and in following years. The artist and academician have always had their own special means of putting the results of their work before the public, and in circumstances where they might be compared with others of a like kind; but the common workman, whatever his work, has not had this chance, and thus without doubt much has been lost not alone to himself as a workman, but to the public for whom he has worked. There are so many differences between the art work (to confine ourselves for the moment to that of the past, and to its then mode of production) and to that of the present of such like work, and to its mode of production—putting aside for the moment the aid of machinery, which is so fast doing all the old-fashioned hand work—that in this short note on one of its specialities we may well put it on one side, and dwell for the moment on the "hand-made" work as it now is, little as there may yet be of it, and that not so much for what it now produces, but for the purposes of comparison, and to show how very much is lost in giving to the "machine" what can really be only done, humanly and characteristically, by the human hand, brain-guided, and by the hand alone, for this hand work cannot even be copied by machinery, though it be so often, and at times so cleverly, attempted.

Among the multitude of contrasts that are to be found, as they are looked after between the work of the past and that of the present, there is nought greater than is to be found between their several modes of utilising, if we may so phrase it, the art capacities, the highest as well as the lower powers, of the working artists of the day. In the old world, the great artists and sculptors of the time, as in Egypt, cut through the hard granite their hieroglyphic writing as carefully and skilfully as they did the lines of the human face above them, and there is to be found in this "writing" almost as much of interest as in the forms which it illustrates, and we allude to this patent fact here in the hope that it may help to encourage those who have, as in this Chelsea working art show, evidenced the individual art power of the ordinary workman. We are here asking attention to the main principle involved in this unique display of hand-work by working men; but now that the late display of it is over, can hardly refer to individual examples of it, though doubtless many such will recur to the recollection of those who were specially interested in this first effort to show to the world the individual capabilities of our working men, and that not only, or even so much, as to their capability of working out in material more or less costly the thoughts of others, but as thinking each one for himself, and as showing to the world as a workman, he can do in the working out of material forms—the true secret, be it noted, of the power of past and antique art over and in the minds of the outer world.

We have thus been led to dwell for a moment on the great principle involved in the simple fact of the late industrial show at Chelsea, having been what it was, a working man's exhibition. It was not a little remarkable in very many ways, but most certainly in none more so than in the fact of its bringing before the public—of a special locality at least—examples of the art and fine art, and manipulative skill and hand-power of very many who have hitherto in these days hardly been thought of sufficient importance, considering their individual artistic position and power, to be thus publicly made note of. In the older and antique world, the work of the workman, whatever it might have been, whether high or low, whether rough as that of the men of the Romanesque, or refined and careful as was that of the Greek in the days of Phidias, each working artist producing it was, it is plain, an art power in himself, and simply wrote within the lines indicated by the architect of the structure a something more or less in connection with it. The Parthenon of the Greek and the cathedral of the man of the Middle Ages alike show this. The structure and the stone surface of it to write on was true, and the subject to write about may be indicated; but the work itself and its artistic teaching and teaching power was, without doubt, the work of the artist and workman by whom it was executed, and its inventiveness and art strength came, without doubt, from such art sculptor himself, each workingman, where there were more than one, as in the Parthenon, doing his own work in his own special manner, but yet as a workman. All this nowadays is reversed. Each workman is but one of many, all working, as much as may be, alike. C. B. A.

BUILDING MATERIALS.—IV.*

By W. Y. Dent, F.C.S., F.I.C.

(*Concluded from page* 428.)

IN distilling coal tar on a manufacturing scale, it is placed in a large iron still capable of holding about 2,500 gallons, heated by a furnace underneath, sometimes assisted by the injection of steam, and the application of an exhaust air-pump. As the still becomes heated, a light naphtha distils over between about 170deg. and 320deg. Fahr., which is of great commercial importance, inasmuch as it contains benzole or benzene, from which is obtained aniline, the basis of a series of colours, such as mauve and magenta. Between the temperatures of 320deg. and 370deg. Fahr. is distilled the liquid known as coal-tar naphtha, which is used so extensively for burning in lamps, and as a solvent for indiarubber. The liquor used for creosoting timber, termed "dead oil," or heavy oil of tar, from its being heavier than water, distils over between 370deg. and 750deg. Fahr.; the residuum in the still is run out whilst hot, becomes perfectly solid on cooling, and constitutes the substance known as coal-tar pitch. This dead oil, or creosoting liquor is of a very complicated character, consisting of a variety of hydrocarbons of different degrees of volatility, and possessing by no means the same antiseptic properties, the relative value of which, in this respect, it is difficult to estimate with any degree of accuracy. In the lighter portions are found carbolic and cresylic acids, substances which have long been known as possessing very great disinfecting properties, so much so, that for a long time they were regarded as the active agents upon which the value of the creosoting liquor (as a preservative agent for wood) depended. Within the last few years, however, the opinions of chemists have undergone considerable modifications in this respect, and there appear to be sufficient grounds for believing that the relative value of creosoting liquors is not represented by the percentage of these acids which they may contain, since, owing to their volatility, they are not retained by the wood for so long a time as some of the other constituents. In the heavier portions of the liquor, or "green oil," as it is termed, distilling over between 550deg. and 750deg. Fahr., are found a number of alkaloids, or bases, amongst which is a powerful germicide of a very pungent and acrid character, termed "acridine," which having a very much higher boiling point than that of carbolic or cresylic acids, is more permanently retained by the wood. The minute glistening scales generally observable on recently creosoted wood consist of naphthalene, a substance that possesses considerable antiseptic properties; when this substance exists in the liquor in moderate quan-

* Being the Cantor Lecture delivered before the Society of Arts.

and a marked separation of the artist and operative has taken place. We can explain it on no other assumption than that labour-saving machinery has benefited only one class, and has taken away from the craftsman the means he had before of developing his skill and exhibiting his art. Things are done piecemeal; the capitalist only reaps the benefit. In this trade also, therefore, as in that of the mason, development from within has been impaired. The highest class of joinery to be found nowadays is in the hands of a very few men, who do the best church work, and are located in the principal towns. They contract for fittings. The skilled village or journeyman carpenter is now no longer met with. The consequence of these things is that the carpenter and joiner is no longer associated with building, except as an independent factor in its production, and contributes very little of his head and heart to the work. The recent statistics published on the depression of the building trades show two main causes of depression in this trade: the importation of manufactured materials and joinery, and speculative building. Reckless speculation is, we believe, the bottom of the trouble, as it draws into competition with skilled hands the inferior workman. But we still look to the carpenter and joiner. His labour constitutes a very considerable and important part of architecture, and the influence of the carpenter on architecture will always be felt. The Carpenters' Company, by providing technical instruction and free lectures, and exhibitions of handicraft, is recovering lost would ground, if only the London apprentices take advantage of them. Again, let not the youth believe he can do without apprenticeship. In London the apprenticeship system is dying out, and the market is being flooded with unskilled workmen. With unskilled joiners, architectural detail must need suffer, and when internal finish deteriorates, the exterior architecture becomes neglected. To masonry and joinery belong the essential part of architecture, and for the credit of art we must preserve them from falling into merely mechanical operations.

BUILDING LAW ADMINISTRATION.

THE irregularity with which the machinery of the law is found to work is one of the grievances of the public. If it is not a blunder or omission on the part of those vested with authority to carry out laws, it may be a dereliction of duty of a more reprehensible kind. The laws in force which concern the architect and builder are few and fragmentary; they are directed to insure the objects of safe and sanitary buildings, and they are supposed to be administered by authorities who are fully versed in the statute book, and who cannot go wrong. Unfortunately, there is no guarantee that these objects are attained. As we are repeatedly reminded, local control may be perfect in theory, but is anything but satisfactory in practice. With divided authorities there is a source of danger as well. Let us take as an example the statute law relating to building in the Metropolis. The application of the Acts, the rules for construction, regulations as to the line and height of buildings, the by-laws as to alterations of buildings not constructed in agreement with them, the regulations of structure of theatres and music-halls, the erection of buildings for dangerous or noxious businesses, are among the statutes in operation. These provisions are on the whole very fairly put into force by the existing administrators of the Acts; the districts are large but are well looked after by the surveyors, and the members elected by the respective vestries and district boards in the Metropolis are supposed to know the requirements of their several localities. But though the machinery is in good working order, there are occasions when the builder has not found it difficult to evade the law in the substitution of inferior materials and workmanship, and even in the carrying out of objectionable arrangements.

More cause for complaint, however, exists in the administration of the law in other towns, where, unfortunately, the web of old and modern legislation is no easy matter to unravel. Early in this century many towns obtained Improvement Acts, and the Public Health Act of 1848 was passed, which applied to the whole country. This Act was supplemented by various special Acts, till in 1871 the Local Government Board was constituted, with powers to control the local authorities; and the Public Health Act of 1875 was passed, sweeping away many local Acts, which by this time had become very troublesome and vexatious. The tangled web of legislation in sanitary matters is even now a source of bewilderment and difficulty in carrying out the intentions of the Legislature. It must be said, too, that the qualifications of members and mode of election of local boards are not all that can be desired to insure the carrying out of regulations of public importance. The members constituting urban authorities are usually property holders, often of a class of buildings which are not models of sanitary arrangement or good construction; and the same remark applies more forcibly to the guardians of the poor, who are owners of property in the rural districts. To qualify them as elective guardians they are to be owners or occupiers of property. Some time since we reported a glaring instance of neglect to provide sufficient closets to a house—the owner of the property being a member of the local authority. The regulations respecting lodging houses are perfect, but are being constantly evaded, owing to the diffidence of surveyors in putting into force rules against members of their boards. How many districts have the by-laws in force respecting houses let in lodgings? Just now, when many seaside towns are full of visitors, attention to certain rules are of urgent importance. For example, there is a by-law which can be put into force by the urban sanitary authority for any district, for fixing the number of persons who may occupy a house, or part of a house, which is let as lodgings. Is this salutary rule followed at Brighton, Hastings, Margate, or any of our popular resorts? Are houses so let registered or inspected; and, above all, we should like to know how many of them are provided with proper closet accommodation and ventilation? The fact is apparent that the local authority is often asleep when it ought to be on the alert, and that the section in the Act which empowers them to make inspections of their district to ascertain nuisances and to abate them is a dead-letter. In large towns like Manchester and Salford the Sanitary Acts have as yet done little to remove the close courts and alleys and the back-to-back houses, to which Dr. Ransome, in his address on consumption at the Sanitary Institute last week, attributed nearly all the phthisical cases in those parts. All borough surveyors are aware of the responsible and onerous duty cast upon them by Section 160 of the Public Health Act, which empowers them to act immediately upon the discovery of any "building, wall, or anything affixed thereon," being in a ruinous or dangerous state, and enables them after giving three days' notice to make complaint before justices, and order the owner or occupier "to take down, rebuild, repair, or otherwise secure," the same. This provision is found in the Towns Improvement Clauses Act, 1847, and is incorporated in the Public Health Act. So with respect to the previous sections, 158 and 159, of that Act, which give power to the urban authority to exercise their authority in cases of rebuilding or the erection of "new" buildings. Surveyors do not like to act upon their sole responsibility—they are, in point of fact, not willing to offend large property-holders, and the consequence is that old and dilapidated structures remain which are dangerous to the public. The borough surveyor has generally to attend to a multiplicity of daily duties, and it is often impossible for him to see that the 99 clauses of the by-laws of the Local Government Board have been enforced. The general opinion of the borough surveyors is that the machinery of administration—the inspection of buildings—is at present completely inadequate to cope with the actual demands. Inspectors of buildings, sanitary and constructive, are not half numerous enough in the larger towns and districts.

We have lately had a very painful experience in the case of fires, both in theatres and houses, of the very unsatisfactory state of local action. The Exeter Theatre calamity is a case in point. There was plenty of legislation, but no one to see that the rules were carried into effect. The authority in that city intrusted with the protection of the public declined even to be represented at the coroner's court. The urban authority are vested with certain powers to make by-laws, but in regard to theatres they are practically without a voice. Plans have to be deposited with them for permission to erect a building, but not to obtain a licence. The regulations of the Metropolitan Board of Works require that every person desirous of opening a place of public resort for the performance of stage plays must give notice to the licensing authority, which notice must be accompanied by plans, drawings, and specifications, the number of persons accommodated in the different parts of the house, and of the area to be assigned to each; they further require that the proscenium wall is to be of brick, not less than 13in. in thickness, 3ft. above the roof. Other local authorities have no authority to enforce these regulations, for, as we find in the evidence, the proscenium wall was only 9in. thick under the stage, the doors in the wall for the orchestra were of wood; while, worse still, the stairs leading from the foyer to the upper circle, the top landing on the entrance to gallery, and the passages round the upper circle and dress-circle boxes were of wood. The evidence will show other departures from these rules, especially as regards the all-important question of exits. The Act of Parliament for the licensing of theatres is an authority of general application. The justices have an assumed power to attach to their license the regulations of the Lord Chamberlain. The statute was passed in 1843, and, as the coroner said, does not limit the power of the justices. But the questions that occur are: Who makes the rules for the regulation of local theatres, and how are they enforced? The Exeter theatre furnishes the answer. It was given in evidence that the rules were prepared by the committee and approved by the justices. The statutory duty of inspection, according to one witness, was not the duty of the magistrates, but of the town council, whereas the city surveyor declared he was solely the custodian of the plans, and not the adviser of the justices. The latter contended that the construction and safety of the building devolved on the town council, and the justices' rules related only to the internal management, a division of duty which accords with the jurisdiction exercised by the Metropolitan Board of Works and the Lord Chamberlain, the latter of whom supervises the internal management. In short, this case furnishes us with a striking instance of the uncertainty which exists in the minds of local authorities as to their precise duties. The magistrates evidently thought the town council was the authority in respect of construction, and therefore did not con-

sider they were to be held responsible. While it is clear there is nothing which requires the justices to make rules, it is reasonable to think the urban authority should possess the requisite power to regulate entrances and exits. The by-laws of towns are chiefly directed to ordinary buildings and to sanitary measures; they are quite inadequate to provide means of ingress and egress to public buildings, and the enforcement of any rules is not clear. We certainly think it time that the Legislature should invest the urban authority with the necessary powers to act in all these and similar cases.

The licensing of buildings for special purposes is a question that must be taken up more thoroughly than it has been. We have now a variety of buildings erected for business and commercial purposes, for recreation and amusement. If a building is erected for a block of offices it should be so licensed, the owner or lessee being held responsible if the premises are let or applied to any other purpose for which it was not designed—if, for example, it should be converted into a factory or store. Premises intended for shops ought to be licensed as such, certain rules being required as to the number of bedrooms that should be allowed within the given area, a condition being that separate entrances and exits should be provided, and that on no account should the upper floors be divided into tenements. Public buildings ought in like manner to be classed and placed under control, the number of entrances and exits being proportioned according to a fixed scale on the number admitted. It would be easy and practicable to devise a code of rules that would apply to every description of building. The too easy conversion of buildings erected for one purpose and used for another would be checked by these regulations, and the licensing would carry with it an authoritative guarantee of the fitness of each structure, which deposit of plan and very uncertain inspections during the progress of erection so often fail to afford the public.

OUR WORKING MEN AND WHAT THEY MAY DO.

IT must needs seem to very many not a little surprising, when carefully thought about, that in a great manufacturing country like this, and in one in which the "fustian jackets" are always and everywhere at work and visible, that so little opportunity has ever—if at all—been given them to publicly exhibit, and to individually show to the world, each one's special aptitude for the work he does, whether by himself or in concert with others. It would be not a little difficult to find perhaps in a day's walk through London town any one single object which could fairly be evidenced as the handiwork of *one* man, and as thus showing what he, as a workman, can do. It is, indeed, surprising to find how little the outer world knows, or can know, of what its individual members are fully capable of, and what amount of mental, we will not say poetic, impression or imaginative power they each one of them can put before the eyes of the outer and non-professional world. Yet more surprising is it to find how impossible it is to do this from the want hitherto of any public institution which might be supposed to exist purposely for such work, and for which but so very few, if any, can provide for themselves. The Parthenon of the Greek and the cathedral of the man of the Middle Ages alike show this. The structure and the stone surface of it to write on was true, and the subject to write about may be indicated; but the work itself and its artistic teaching and teaching power was, without doubt, the work of the artist and workman by whom it was executed, and its inventiveness and art strength came, without doubt, from such art sculptor himself, each workingman, where there were more than one, as in the Parthenon, doing his own work in his own special manner, but yet as a workman. All this nowadays is reversed. Each workman is but one of many, all working, as much as may be, alike. C. B. A.

BUILDING MATERIALS.—IV.*

By W. Y. Dent, F.C.S., F.I.C.

(*Concluded from page* 428.)

IN distilling coal tar on a manufacturing scale, it is placed in a large iron still capable of holding about 2,500 gallons, heated by a furnace underneath, sometimes assisted by the injection of steam, and the application of an exhaust air-pump. As the still becomes heated, a light naphtha distils over between about 170deg. and 320deg. Fahr., which is of great commercial importance, inasmuch as it contains benzole or benzene, from which is obtained aniline, the basis of a series of colours, such as mauve and magenta. Between the temperatures of 320deg. and 370deg. Fahr. is distilled the liquid known as coal-tar naphtha, which is used so extensively for burning in lamps, and as a solvent for indiarubber. The liquor used for creosoting timber, termed "dead oil," or heavy oil of tar, from its being heavier than water, distils over between 370deg. and 750deg. Fahr.; the residuum in the still is run out whilst hot, becomes perfectly solid on cooling, and constitutes the substance known as coal-tar pitch. This dead oil, or creosoting liquor is of a very complicated character, consisting of a variety of hydrocarbons of different degrees of volatility, and possessing by no means the same antiseptic properties, the relative value of which, in this respect, it is difficult to estimate with any degree of accuracy. In the lighter portions are found carbolic and cresylic acids, substances which have long been known as possessing very great disinfecting properties, so much so, that for a long time they were regarded as the active agents upon which the value of the creosoting liquor (as a preservative agent for wood) depended. Within the last few years, however, the opinions of chemists have undergone considerable modifications in this respect, and there appear to be sufficient grounds for believing that the relative value of creosoting liquors is not represented by the percentage of these acids which they may contain, since, owing to their volatility, they are not retained by the wood for so long a time as some of the other constituents. In the heavier portions of the liquor, or "green oil," as it is termed, distilling over between 550deg. and 750deg. Fahr., are found a number of alkaloids, or bases, amongst which is a powerful germicide of a very pungent and acrid character, termed "acridine," which having a very much higher boiling point than that of carbolic or cresylic acids, is more permanently retained by the wood. The minute glistening scales generally observable on recently creosoted wood consist of naphthalene, a substance that possesses considerable antiseptic properties; when this substance exists in the liquor in moderate quan-

* Being the Cantor Lecture delivered before the Society of Arts.

tities it thickens and improves its consistency; but when there is a very large proportion, as is frequently the case with creosoting liquor obtained by the distillation of coal tar produced at gas factories in which Newcastle coal is employed, it makes the liquor too solid. To be of proper consistency the liquor should be completely fluid at 100deg. Fahr., and should exhibit no signs of any deposit on cooling down to a temperature of 90deg. Fahr. There are two classes of creosoting oil, known in the trade as London oils and country oils. The London oils, which consist of those obtained from the gas-tar derived from Newcastle coal, contain a larger proportion of naphthalene, and are heavier and thicker than the country oils of the Midland districts, which yield a larger proportion of tar acids (as they are termed), consisting of a distillate which is capable of being dissolved by a solution of caustic soda containing 9 per cent. of the alkali. Previous to the year 1863 only a comparatively small quantity of these thin country oils had been used for creosoting purposes, but they subsequently became more in demand, under the impression that the value of the oils depended upon the proportion of tar acids they contained. This question was investigated in 1866 by Mr. Coisne, an engineer in the service of the Belgian Government, whose experiments were continued during a period of five years, and the results obtained led him to the conclusion that the so-called green oils, distilling over at high temperatures, formed the best portions of the creosoting liquor, and that the importance of the tar acids had been much overrated. In carrying out the creosoting process on a large scale, the dried wood (cut up into the sizes in which it is going to be used) is placed upon iron trucks, which are run on a tramway into large air-tight cylinders 6ft. in diameter, and from 20ft. to 70ft. in length, heated by steam-pipes placed along the bottom. When the trucks have been run into the cylinder, the end is closed, steam is admitted to the heating pipes, and an exhaust-pump is put in action which is capable of creating a vacuum of 25in. When this has been attained, the creosoting liquor is admitted from a reservoir, in which it has been kept at a temperature of 120deg. Fahr., by means of steam-pipes. A force-pump is now put in action, by which a pressure of 150lb. on the square inch is maintained for a period of from 6 to 10 hours, the temperature of 120deg. Fahr. being also kept up by means of the steam-pipes; the amount of pressure given, and the length of time that the steeping is continued, depends upon the description of wood to be treated, and the quantity of creosote that is required to be absorbed. When cost is no object, the penetration of the liquor as regards some descriptions of wood which absorb the most readily, such as beech and deal, is capable of being extended to a depth of 10in., but, as the process is usually carried out, the penetration does not extend further than from ½in. to 4in. The progress of the absorption of the liquor by the wood is ascertained by observing the quantity left in the reservoir, which is registered by a gauge, the amount usually required being about one gallon to a cubic foot of timber of the sizes employed as railway sleepers. When the wood has absorbed this quantity, the pressure is removed, the liquor remaining in the cylinders is run off, the end is opened, and the trucks with their loads of creosoted wood are withdrawn. I have stated that in carrying out the creosoting process, as above described, it is necessary that the timber should be dry. Now it is well known that timber is injured by exposure to a dry heat, 230deg. Fahr. being the extreme limit to which it can be exposed without liability to injury, and all attempts that have been made to effect the drying by stoves, currents of hot air, or superheated steam, have had to be abandoned; but by a modification of the creosoting process patented by Mr. Boulton, the moisture can be removed at the commencement. For this purpose a dome is fitted to the top of the cylinder, the liquor is admitted at a temperature only slightly exceeding 212deg. Fahr., and the action of the exhaust-pump is continued for some time after the admission of the liquor. It will be seen that the wood is thus subjected to a moist heat above the boiling point of water, by which the water in the pores of the wood is converted into vapour and drawn off by the action of the suction-pump, the creosoting liquor taking the place of the water withdrawn from the wood. When the creosoting process has been properly carried out, the wood will be found to have increased in weight to the extent of from 8lb. to 10lb. per cubic foot, and to have been rendered so secure against the attacks of the marine boring worm, that a piece of timber has been known to have been riddled by such attacks in places where the liquor has not reached, and to be untouched where it has been properly impregnated with the creosoting liquor. This tar liquor not only possesses those antiseptic properties by which fermentation and the growth of insect life is arrested, as well as the power of coagulating the albumen of the sap in the same manner as is the case with copper sulphate or corrosive sublimate, but it also possesses the additional advantage of impregnating the wood with a liquid of an oily nature which is repellent of water. The efficacy of this process, and its superiority to all others that have yet been tried, is supported by the results of numerous experiments that have been made with great exactitude and care, both in this country and abroad, by engineers and others. There is no country so deeply interested in the protection of timber as Holland, on account of its having such a large extent of coast protected from encroachments of the sea by dykes that are constructed of timber. On several occasions fears have been entertained of large portions of the country becoming submerged owing to the destruction of the timber dykes by the ravages of the teredo, which works with such rapidity that in some instance piles have been known to have been eaten away to a dangerous extent in the course of a few months. The question of the preservation of their timber piles became one of national importance to the Dutch Government, and a commission was appointed, consisting of engineers and members of the Royal Academy of Amsterdam, to institute a thorough investigation of the subject. The experiments carried out by the commission were divided into three groups:—(1) Applications to the surface of the wood; which included carbonising or charring the wood, by subjecting it to a high temperature; treatment with paraffin; covering with sheet copper or zinc; covering with broad, flat-headed iron nails, driven in close together and allowed to rust. (2) Impregnation with different liquids, including solutions of sulphate of copper, sulphate of iron, acetate of lead, water glass, chloride of calcium, and creosoting. (3) Different kinds of unprepared wood. The conclusions that they arrived at were—That the only reliable process for protecting wood from the attack of the teredo was that of creosoting, and that even this fails if the process has not been properly carried out; that no kind of unprepared wood (greenheart included) is to be altogether relied upon as secure against the attacks of the teredo. The descriptions of wood used in the construction of the dykes are fir, beech, and poplar. Some time ago twelve piles of each of these woods were sent over to this country to be creosoted; these were returned to Amsterdam, and placed in positions where improperly creosoted wood had previously been destroyed, and in no instance were any of the twelve piles attacked by the teredo. Some years ago experiments were made at Plymouth with different kinds of wood, consisting of red and yellow pine, American and English oak, elm, beech, fir, and pitch pine, which, after being dried in an open shed, were subjected to the following processes—viz., creosoting (one gallon of the liquor per cubic foot being forced into the wood), kyanising, and the sulphate of copper process. Blocks of each kind of wood, after being subjected to the several processes, as well as others without any preparation, were sunk in still water to the depth of 20ft., and, after remaining for 2½ years, were taken up and examined. All the creosoted pieces were found to be sound, and all the unprepared pieces were worm-eaten. Of the kyanised, five were sound, and three slightly attacked; and of those prepared by the sulphate of copper, only one was sound. The increased use of creosote is shown in a report of July, 1884, to the Technical Convention of the German Railway Union, in which it is stated that in 1865 there were fifteen railway companies in Germany employing the sulphate of copper process, whilst eleven had adopted that of creosoting. We have now had nearly fifty years' experience as regards creosoted timber. Wood so prepared was employed in the construction of dock gates at Monk Wearmouth as far back as the year 1839; creosoted wood was also employed on a considerable scale, in 1846, at Lowestoft. The evidence that can be produced of the value of this process as a means of preserving wood so far exceeds anything that has been advanced on the part of any other, that its claim to be regarded as superior to all other processes at present known, and as that upon which the greatest reliance can be placed, may be considered as fairly established. The teredo is a grey-coloured worm, ordinarily, when full grown, about 10in. or 12in. in length, but in favourable situations (such as the Gulf of Mexico) it will sometimes attain a length of 23in. It is a species of mollusc, having at one extremity a boring apparatus of the most perfect description, consisting of a hard, shelly-like substance, which fulfils the part of an auger and a rasp. The teredo first makes its appearance in the form of a very minute egg; the eggs are laid at the commencement of the warm season, and are hatched in the water, giving out larvæ so small as to escape notice of the inexperienced observer, being not more than about 1-25th of an inch in length. After swimming about for a day or two, they begin to search for timber, which they enter by boring a very minute hole not larger than a pin's point; it is, therefore of the greatest importance that no portion of the surface of the wood should be left unprotected by the preserving agent employed, and hence arises the necessity for cutting up the wood into the sizes in which it is to be used before submitting it to the creosoting process. The teredo grows rapidly under favourable circumstances, enlarging its hole as it increases in size. Its smaller end (consisting of two tubes) is attached to the end of its burrow, whilst its other extremity, armed with the auger, is pushed forward into the wood, the length of the tunnel corresponding with that of the teredo. As it progresses, it deposits a coating of carbonate of lime upon the sides of its cell, in which it continues to increase for from twelve to eighteen months, and then dies, after blocking up the entrance to its burrow with carbonate of lime. This stopping is soon penetrated by the water, which washes out the lining, leaving a smooth, clean hole to bear witness to the destructive habits of this dangerous enemy to wooden structures. The teredo perforates in the direction of the grain of the wood as far as possible, but on meeting with a knot or anything which it regards as obnoxious, it avoids the obstacle by working round it, or it will work back and begin a branch tunnel, taking care to seal up the abandoned portion of its cell with carbonate of lime. It is a curious fact that although there may be hundreds of these worms in the same piece of timber, they never break into a neighbour's tunnel, although they will cut away within a hair's breadth of each other, or of the outside of the timber. A division, however thin, is always left intact. The teredines thrive best in salt water and in warm climates, muddy fresh water being destructive to them.

PAINTING.

The method ordinarily adopted for preserving wood is that of painting, and in order to secure the attainment of this object, it is necessary that the material used for the solid portion or pigment should consist of some substance which can be obtained in a very fine state of division, and which is but little liable to change by long exposure to the weather. Various metallic oxides, such as the oxides of lead and zinc and the higher oxides of iron, fulfil these requirements, and we consequently find that these substances enter largely into the composition of paints. By far the most important of all the substances employed as pigments is that which is known by the name of whitelead, which varies in its character according to the process adopted in its manufacture. In spite of the very numerous alleged improvements that have been announced within the last thirty years as having been made in the manufacture of whitelead; the largest portion of the best whitelead is still manufactured by the old "Dutch" process, as it is termed, from its having been introduced into this country from Holland. This process depends upon the corrosion of metallic lead; it is well known

that when lead is exposed to moist air, the surface of the lead is corroded—that is, it is converted into a white substance which consists of carbonate and oxide of lead. The purest metalllic lead is most susceptible of this change, and it is partly on this account, and partly because the whitelead produced from the purest lead is of a better colour, that manufacturers of whitelead are always anxious to obtain the best brands of metallic lead in the market. Nearly all lead contains traces of copper and silver, and very small quantities of these impurities affect the quality of the whitelead so much so that, when silver is present, even to so slight an extent as 1½oz. in a ton of lead, it imparts a distinctly pink colour to the whitelead. In carrying out the manufacture by the Dutch process, the lead is first cast into gratings or crates by pouring the melted lead into an iron frame with longitudinal and transverse grooves into which the lead runs. This is done by machinery; the iron moulds are fixed on to an endless chain, and are being continually filled by a small stream of melted lead flowing from an orifice which can be opened or closed at pleasure, so as to regulate the flow of the metal. As the chain moves round, the crates of lead, when they have become solid, are thrown out, and are taken away to be placed in the corroding pots. The object in casting the lead in this form is to promote a freer circulation for the corroding vapours, and a larger amount of surface of metal to be acted upon than would be the case if the lead were cast in solid thick pieces. The corrosion is effected by exposure to the combined action of the vapour of acetic acid, carbonic acid, and moisture. The pots in which the lead is placed are made of earthenware, and have a shoulder in the interior about one-third of the height of the pot, upon which the coiled crate of lead rests. The pots are stacked in large beds of spent tan, which is spread evenly over the floor to the depth of 2ft. or 3ft., upon which the pots are arranged in rows. Into each of the pots is put about one pint of acetic acid of about the strength of ordinary vinegar, which fills the pot up to the shoulder upon which the crate of lead rests. Tan is then placed around the pots to a level with the top, and a floor of loose boards is laid across the whole; this flooring is again covered with tan to the depth of 12in., a second series of pots, tan, and boards follow, which are succeeded by others, the stack being completed by a layer of tan from 24in. to 30in. in thickness. These stacks are of very large dimensions, often containing as many as from 6,000 to 10,000 pots, turning out from 30 tons to 40 tons of whitelead. Ventilating shafts are left in various parts of the stack for promoting the circulation of the corroding vapours through the several rows of pots, and for the escape of moisture. In the course of six or seven days after the completion of the stack, the tan begins to ferment and become hot, which promotes the rapid corrosion of the lead. The process is completed in about twelve weeks, and the stack is then taken to pieces. The temperature is regulated, as far as practicable, by covering or uncovering the ventilating shafts, but it is difficult to secure a uniform temperature throughout the whole of the stack. It will sometimes rise in the centre to 180deg. or 190deg., which causes the acetic acid to evaporate too rapidly without a corresponding increase in the corrosion being effected, whilst at the exterior portions of the stack the temperature is sometimes not high enough, which is also detrimental to the quality of the whitelead produced, the best results being obtained when the temperature ranges from 150deg. to 160deg. Fahr. It will be seen that the lead in this process is placed under the most favourable conditions for corrosion, being exposed to the action of acid fumes assisted by heat and moisture. On breaking up the stack and removing the upper layer of tan, as well as the boards which covered the pots, the lead is found to have become thickly incrusted with whitelead, only a thin core of metallic lead remaining. If the process has been properly carried out, no acetic acid is left, it having been dissipated by the heat generated during the fermentation of the tan. The separation of the whitelead from the metallic lead, or blue lead, as it is called, which remains, is effected by placing the corroded lead in a covered hopper, where it meets with a stream of water, and falls into a trough in which it is knocked about with wooden rakes. The whitelead, which is easily detached from the lead core which has not been acted upon, is then conveyed to a series of grindstones, by which it is reduced to a very fine state of division, and is carried off suspended in water to tanks, in which it is allowed to deposit. The clean water is siphoned off, and the paste of whitelead is placed in bags and subjected to hydraulic pressure (by which the greater part of the water is squeezed out), dried, and ground. The grinding is conducted in a mill so inclosed as to prevent the escape of dust. The reaction which takes place in the production of whitelead by this process consists in the formation of a basic acetate, which is subsequently decomposed by the carbonic acid generated by the fermented tan, the final result being (when the process has been carried out in the most perfect manner) the production of a basic carbonate consisting of two equivalents of carbonate of lead and one of hydrated oxide. The process is a slow one, involving a great amount of labour; moreover, the arrangements for accomplishing a very simple operation appear clumsy and unscientific; many attempts have consequently been made at different times to supersede it by others of a more rapid and economical character. These attempts, however, although they appeared to be full of promise, have not hitherto been attended with that success that had been anticipated by their originators. It was very naturally supposed that a similar result would be produced by exposing sheets of lead in a closed chamber to the joint action of air, carbonic acid, vapour of water and acetic acid, and various attempts have been made on this basis. The method proposed by the celebrated French chemist, Thénard, consisted in passing carbonic acid through a solution of the basic acetate of lead, and whitelead thus made was for some time sold under the name of Clichy white. Numerous patents have since been taken out for the manufacture of whitelead upon the same principle, but differing in detail. Martin's process consisted in exposing metallic lead in the condition of thin scales (obtained by causing the melted lead to fall upon a revolving copper cylinder kept cool by a current of water) upon a series of racks placed over each other, through which a solution of acetate of lead trickled. The basic acetate thus formed being subsequently decomposed by carbonic acid, the carbonate of lead thus obtained was then mixed with lead oxide prepared by exposing granulated lead in a barrel perforated so as to admit air, and caused to revolve in a trough containing a little water, which washed off the oxide as it was formed. It was found, however, that the product obtained by the precipitation of a salt of lead from solution, even when so manufactured as to possess precisely the same composition as that made by the Dutch process, is more or less crystalline in its character, and does not possess that density upon which the excellency of the whitelead produced by corrosion depends, which is known in the trade by the term "body." The chief objection to the Dutch process is the fact that it cannot be carried out without injury to the health of those engaged in the manufacture, owing to the absorption of lead into the system, partly from the floating particles in the air, and partly through the pores of the skin from handling the whitelead during the several processes it undergoes. The workpeople are, consequently, liable to attacks of painter's colic, a disease which produces pains in the limbs, a characteristic blue discolouration of the gums, and sometimes partial paralysis. The evils arising from this cause have, however, in all well-regulated works been greatly diminished by taking care that, as far as possible, the various operations of scaling, &c., should be carried on in water, by providing respirators for those exposed to the dusty particles, and gloves for those who have to handle the whitelead, and by enforcing the strictest regulations as to cleanliness. The assertion is often made that persons may be affected with lead poisoning by the vapours arising from a newly-painted wall, but such assertions are not supported by any sufficient evidence. Experiments that have been carefully made show that no lead in any form or shape either evaporates or is carried off mechanically during the drying of the paint. The fact is, that the vapours arising from the oil and turpentine affect some people to such an extent as to make them seriously ill, and the effects produced by fresh paint would be the same whether the pigment employed consisted of whitelead or zinc oxide. Whitelead, as ordinarily used, is mixed to a large extent with sulphate of baryta, a substance which, on account of its high specific gravity, is in much request as an adulterant. Amongst the most recent substitutes for whitelead as made by the Dutch process is the so-called "non-poisonous whitelead" of Messrs. Freeman, which is prepared by grinding under considerable pressure a precipitated sulphate of lead with 25 per cent. of zinc oxide, whereby the density of the mixture is greatly increased. This preparation possesses the advantage of a very simple and unobjectionable method of manufacture, and of keeping its colour better than ordinary whitelead when employed in situations in which it is exposed to air containing sulphur compounds, such as in railway tunnels. It is equal to the ordinary whitelead in point of colour, and is reported to be so as regards "body" and durability, but this last point can only be decided after the lapse of sufficient time. For situations in which paint is likely to be subjected to the influence of gases containing sulphur, zinc is decidedly to be preferred to lead as the basis of the pigment to be employed, inasmuch as zinc sulphide, instead of being black like lead sulphide, is of a light colour. Zinc white is an oxide of zinc prepared by burning metallic zinc in a retort or furnace in a current of air, the zinc oxide passing over a bridge into a chamber, in which it is collected. It is then placed in canvas bags, and pressed into a hard mass with the object of increasing its density. It may also be prepared by precipitation from solution by means of lime, drying and calcining at a red heat. By whatever method it may be prepared, it will not compete with whitelead as regards density, neither will it stand the same amount of exposure to the weather. A patent white sulphide of zinc paint is manufactured at Liverpool by the Sanitary Paint Company, which consists of a mixture of sulphide of zinc and sulphate of baryta, produced by adding a solution of sulphide of barium to a boiling hot solution of sulphate of zinc. The precipitate produced is pressed, dried, and ignited in a furnace to drive off excess of sulphur. It is then levigated with water to wash out soluble salts, and the pigment is completed by again pressing, drying, and grinding. This paint, when not properly manufactured, has sometimes been found to become discoloured under the influence of strong sunlight, the dark tinge which it assumes passing off again after a few hours. For coating iron work the black and red oxides of iron have been extensively employed for many years; one of the first paints of this description was introduced about thirty years ago under the name of Torbay paint, from its having been prepared from a brown iron ore found at Torbay, in Devonshire, to which various tints from a light brown to a very dark red can be given by altering the conditions under which it is roasted. The black oxide of iron, which is obtained as a by-product in the manufacture of aniline dyes, is also employed in the preparation of a paint for iron work. These last-named metallic oxides have not, however, the power of combining chemically with the linseed or other oils used for grinding with the pigment to the same extent as is the case with oxide of lead, which, by combining with the fatty acids of linseed oil, readily produces a soap such as that known under the name of lead plaster. There is another pigment of some importance that is now manufactured on a considerable scale at the works of the Bristol Sublimed Lead Company, obtained from the condensation of the fumes given off during the process of lead smelting, the escape of which into the atmosphere is known to produce such deleterious results in the neighbourhood of lead works. The fumes consist mainly of sulphate and oxide of lead in the condition of a very fine, impalpable powder, which cannot readily be made to subside, the various attempts that have been made for the achievement of this object having been the subject of numerous patents. It is, however, now successfully accomplished by means of flannel bags, through which all the gases and volatilised products from the lead furnaces are forced, the solid particles being retained by the flannel. This powder is collected, and when re-sublimed

yields a white pigment which varies in its composition according to the nature of the lead ores employed, but usually consists of about 70 per cent. of sulphate of lead, 23 per cent. of oxide of lead, with a little oxide of zinc. In point of colour it cannot compete with ordinary whitelead, but it forms a good basis for lead-coloured paints, of which vast quantities are required. I stated at the commencement of these lectures that it was not my intention to enter more fully into the nature of the great variety of substances used for painting than was necessary to give a short description of the pigments usually employed as a basis for the commoner kinds of paints most generally used for the preservation of wood and iron. All that I have endeavoured to accomplish has been to afford some information as to the general principles upon which the technical value of the different building materials passed under review depends, without going more fully into details than is necessary for explaining the matter in hand, and occupying more time than a course of lectures on so wide a subject permits.

IRON STAIRCASES.*

[WITH ILLUSTRATIONS.]

STAIRCASES serve as a means of communication between the several stories in a building. They are a succession of steps, or grades, supported by, and framed into, one another on the slant, and consist of a horizontal part, called foothold or tread, and of a horizontal part, the riser.

Of the Foothold.—In straight staircases, the breadth of the step taken mid-way between the extremities is the foot print. In balanced staircases, or such as have dancing steps exceeding one mètre in length, the breadth of tread or foot print must be taken parallel to the horizontal projection of the hand rail at 50 centimètres distance therefrom. The line formed by the successive foot prints is called the line of traffic. This distance of 50 centimètres from the handrail represents the position of a person ascending or descending and holding the rail.

Balancing.—The breadth of the treads in their curved or straight portions is arrived at by making a drawing on the floor or wall. First, the number of dancing steps or winders, deemed indispensable, is determined, and then the minimum dimension of the smallest inner angle. In the next place the compasses are brought into requisition to settle the measurement of the tread in the centre, gradually decreasing the opening, until it equals the measurement of the smallest inner angle, taken as a starting point. It is by a tentative process, rendered easy by practice, that the best result is obtained. Geometrical methods are hardly ever resorted to.

Height and Breadth of the Steps and Landings.—The height and breadth of the steps are very variable quantities, generally subject to the exigencies of the space reserved for a staircase. As a rule, the broader the tread at the line of traffic, the lesser ought to be the riser or the height of a step. The breadth of the treads varies from 23 to 40 centimètres, and the height of the risers from 11 to 19 centimètres, a maximum and minimum that should never be exceeded. The most ordinary dimensions are from 25 to 35 centimètres for breadth, and about 16 centimètres for height. Within these limits stairs are always easy of ascent and not tiring. On the ground floor it is usual to allow more breadth for the first three steps; for the first step, an extra 3 centimètres; for the second, 2 centimètres; for the third, 1 centimètre extra. Thus, for instance, in a staircase of which the breadth of tread is equal to 30 centimètres, the first step will be 33; the second, 32; and the third, 31 centimètres. Where we are not obliged to observe fixed dimensions in the staircase cage and in the height of ascent, in getting out plans the step may be set down as $2h. + b. = 60$ to 66 centimètres, or twice the height and once the breadth equal 60 to 66 centimètres, a formula that works out well. An ordinary staircase to be convenient should be kept to a pitch ranging between 24° and 30°. It should consist of steps uniform in height, at least, in each flight or difference of level between the floors of each story, measured from flooring to flooring. The landings should be 80 centimètres broad as a minimum, and in any case not fall short of the sum of three steps measured horizontally at centre of the tread. This remark applies particularly to back stairs and small staircases, where space is limited. Speaking generally, landings should be made as broad as possible.

Character and Dimensions of Stairs.—Steps are made in chequered masonry, cement, &c., of fir, pitch-pine, beech (rarely), stone, marble, and iron. Thicknesses for wooden steps in staircases vary from 27 to 54 millimètres. In large staircases, such as we find in railway stations, for instance, the thickness of the treads attains to as much as seven centimètres (planing will reduce it by three to four millimètres). The thickness in the case of stone or marble varies from six to eight centimèters. However, in staircases not exposed to rough usage, marble slabs may be used as thin as three centimètres as a minimum, provided they be fairly and squarely placed on a bed of plaster.

Head Room or Height of Passage.—An important question in the construction of staircase, and which should be well considered in working out the plans, is the allowance of a sufficiency of head room. In stairs of the most usual style, those of the ordinary dwelling house let out in flats, we must bear in mind: (1) The head room in the stairs leading down to the cellars. Fourteen steps are required as a minimum, to allow two mètres for the cellar door, a height which, according to the importance of a house and its destined uses, may be reduced to one mètre and eighty centimètres, or even to 1¾ mètres. (2) The ground floor, always having a greater elevation than the other stories, requires a larger number of steps, which can only be provided by advancing the point of departure to make up the difference; the consequence being that the landing of the first story must stand over the sixth or seventh step, thus reducing the headroom by that much. Now, to get over this difficulty, we may increase the height of the steps, in order to lessen their number, and thus bring the landing over the third or fourth steps. The steps of the first revolution may, without disadvantage, be increased in height by 8 to 10 millimètres, and it is more particularly in the upper stories that the rise of the steps should be kept down as much as possible. The headroom should not fall short of 2 mètres and 20 centimètres; below this height the moving of the furniture is apt to spoil the ceiling. The starting-point of a staircase should be placed beneath the first-floor landing.

VARIETIES OF STAIRCASES.

The "Miller's Steps."—This style of stair is simply a straight flight of treads without risers, with a pitch sometimes attaining to, and even exceeding, 45°. The treads are about 20 centimètres in breadth and 20 centimètres in height. The same arrangement is adopted for cellar stairs.

Straight Flight Stairs.—These are generally used as outside stairs. Their dimensions are the usual ones—viz., 90 to 120 centimètres for length of step, and they can be supported by means of brackets, columns, or posts. In the example we give, Fig. 17, the stringboard consists of two T-irons, 45in. by 50in., united by means of 4 millimètre iron braces or plates, and rests upon a 10-centimètre, cross-shaped iron, into which the lower T-irons vanish, taking the shape of brackets. Figs. 18 and 19 show the jointing. A rack made of flat iron, 30in. by 7in., receives the risers and treads made of striated sheet-iron, the other extremity of which is run into the wall. Fig. 20 is the staircase on plan.

Stairs between Walls.—In this mode of construction there is no stringboard, the treads and risers being built into the wall at each end, and the masonry walls serve alike as supports and as handrails for the stairs. Sometimes a handrail is let into the wall, consisting of a round iron rod, or an iron bar cased in a wooden rail.

Helicoid, Spiral, or "Limaçon" (Snail-shaped) Staircases (Figs. 1 to 10).—These stairs are of two kinds: first, those built round a solid newel post supporting all the steps (Fig. 8), in which each riser is a species of independent gibbet, joined to the rest by the string-board. When such stairs are contained in a cage, the stringboard is dispensed with, and the steps are built into the wall. If there be points of contact only with the walls, it is right to avail oneself of them to fix a stringboard, so as to relieve the strain on the risers.

Plan of a "Limaçon" or Snail-shaped Staircase.—This form of stair finds its application in warehouses, shops, &c., for purposes of direct communication either with the basement or the first floor. The available space in such cases is limited as a rule, and these staircases at times are reduced to 50 or even 45 centimètres length in the treads. So reduced, the central portion, or rather the breadth of the tread in the middle, is very small, something like 15 centimètres to 50 of length of tread, and we are confronted with the problem of the head room, or sufficiency of space to admit of persons standing erect in ascending and descending. This height, with rare exceptions and to admit of the staircase fulfilling the necessary requirements, should never be less than 1 mètre 85 centimètres to 1 mètre 90 centimètres. It will be readily understood that in such cases it becomes impossible to increase the breadth of the treads. If, for instance, we desire to have 25 centimètres to give the foot a solid rest, we shall get, in working out a snail-shaped staircase of 50 centimètres length of tread, a radius of 30 centimètres, taking the radius of a newel of 10 centimètres, say $2 \pi R = 1{\cdot}8849$ mètre of circumference at the middle of the step, and if we divided 1·8849 mètre by 25 centimètres we should obtain about seven and a half steps or treads. Let us take eight, and reckoning on a maximum of 19 centimètres of height, we shall get 1 mètre and 52 centimètres of elevation between the No. 1 and the No. 8 treads, an insufficient space to stand erect in. To save the loss of time involved in a process of groping, we shall here offer a method of setting out adopted by specialists in the building trade, which always insures sufficient head room. The dimensions of space and height of ascent being determined, let the circumference be divided into 13 equal parts (Fig. 9), and the height into parts of 17 centimètres as a minimum. Thirteen treads on plan give 14 heights. By deducting that of the fourteenth, there will be secured free passage, $17 \times 13 = 2{\cdot}21$m.; and if we take into account the head room at the landing, we shall have to deduct two treads, or $2{\cdot}21\text{m.} - 0{\cdot}34 = 1{\cdot}87$m. To increase the head room as much as possible, the landing is shaped into a curve, as shown in Fig. 9. In building with iron, the newel post is made, according to the lengths of the treads, of tubes measuring from 8 to 14 centimètres diameter, the stringboard of 3 to 6 millimètres hoop or sheet iron, and the risers of from 2½ to 3 millimètres thickness. The risers are invested at the top and bottom with angle irons, and likewise at their extremities, and jointed by means of screws to the newel-post and the stringboard. We show at Fig. 10 an arrangement of great solidity, which allows in staircases of small dimensions of substituting a plain flat sheet of iron, 50 by 7, in the room of the stringboard. This plan consists of making the angle iron, forming the border for the tread at the outer end, broader in the wing—say, about 45 millimètres—and of putting a bolt of 14 millimètres through the newel-post which keeps together the ascending flight. The second type of winding or spiral staircase has a hollow newel. It is more properly called an open circular staircase. This is far more convenient than the staircase with a solid newel; but it involves the necessity of finding more space, though not so much as the square, rectangular, and other types of stairs. It lends itself more readily to purposes of decoration, and may be used for private houses, shops, offices, &c. The hollow or open space should be kept to from 40 to 60 centimètres measurement. The oval and elliptical forms are adaptations of this type; the figure-of-eight-shaped one, shown in Fig. 3, is very effective. It is just precisely in such special types that iron shows all its many advantages, both as regards the manufacture, the setting out, the bevelling, and the elegance, lightness, and delicacy of form. The construction of the type we present in Figs. 1, 2, 3, 4, 5, 6, and 7 is of the simplest. A double stringboard, taking the form indicated, is bound together by sheet-iron risers, fitted with angle irons and Z irons, as per Fig. 4. Open scroll work at each end lightens the structure as a whole, while a carpet of 70 to 75 centimètres width, laid down in the centre, is secured by stair rods, held by eyes, as seen in Fig. 6. Fig. 5 is a section of the riser.

* From "Nouvelles Annales de la Construction."

One of the rings of the 8 is carried by a small central column, the bearing strain on which is distributed by four brackets. This small column may be converted into a lamppost, a bracket burner with globes, or any other decorative mode of illumination. The upper portion is supported either by carriages (as we shall describe in the sequel when treating of the landings) or by brackets, or by a second column placed in the axis of the ring of 8. This staircase can also be constructed with four columns placed at the points of intersection, formed on the plan by the stringboards. Circular staircases may be adopted also in the case of large houses let out in flats; but in these we must provide for a well-hole of considerable dimensions and large landings. The length of the steps would here vary from 1½ to 1⅔ mètres. The instance we give in Figs. 11, 12, and 13 is that of a stair contained in a cage built of iron of 15 centimètres thickness, coating included, as housing becomes impossible in a thin partition. Each flight rests upon five 11-millimètre iron-plate brackets built into the masonry, bolted between the double metallic uprights of the iron casing and connected with the stringboard by means of stout iron squares. To bind the risers there is a false stringboard of 5 millimètre iron plate running round the circumference of the cage. This staircase is adapted to receive a lift. The well-hole measures 1 mètre 90 centimètres inside the flight. A lift cage of 1½ mètres diameter can very well be made to work in it, keeping it sufficiently away from the edge of the stairs to avoid the guillotine action which would take place if the lift passed too close to the outer string. To effect this we must adapt the flight by raising it, or must fit the well-hole with a metallic netting which gives it very much the appearance of a cage. These means attain the object in view, but the result leaves much to be desired.

Stairs with a Single Central Stringboard without Well-hole.—This solution is rendered necessary when we are required to build a staircase with the utmost possible length of steps. The stringboards are superposed in the same plane in all the flights, one above the other, while the handrails run into each stringboard of the next flight. These staircases are made in unbroken flights when the landings are not one above the other, and with intermediate resting-places if the landings are in superposition. These staircases are mainly employed in the construction of barracks, colleges, &c.

Stairs Broken into Landings (Figs. 15 to 22).—These are composed of straight portions according to the walls of the cage and separated by resting-places (Fig. 22) either at the angles or for intermediate places of access. Figs. 14 and 15 represent a servants' staircase, 85 centimètres wide, which presents a combination of the broken and the winding stairs.

Semi-circular Staircases.—These are most frequently found in warehouses and small private dwellings. They are contained in a rectangular cage in a hemicycle. The step varies from 1 mètre to 1 mètre and 30 centimètres in length, and the well-hole measures 35 to 80 centimètres. As a minimum of dimensions, we may refer to a staircase in a house for letting, built according to the following measurements:—

Width of cage	2	mètres,	30	centim.
Length of cage	3	„	30	„
Breadth of tread (foothold)	0	„	23	„
Length of tread	1	„	2	„

The height of the steps are 17 centimètres on the ground floor and 16 centimètres in the upper stories. The ground floor is 3 mètres and 40 centimètres high, and the upper stories 2 mètres and 90 centimètres, measured from flooring to flooring. However, we say it again, these dimensions are hardly sufficient, and if adopted it must be on compulsion to meet the exigencies of plans and of the configuration of the ground. If the well-hole be large enough, say 75 centimètres at the least, the steps may be balanced in a radius, that is to say—their prolongations may be made to converge towards the centre; but to render the transition from the head to the straight, three to six more winders may be introduced, according to the importance of a staircase; the remainder of the steps being parallel to one another. If, owing to the exiguity of the space reserved for the staircase, the well-hole be reduced to 35 centimètres measurement, all the steps must be dancing steps or winders.

Staircase with Double Revolution.—The staircase with a double revolution, introduced in many buildings, be it square, rectangular, or round, has a central flight of large breadth, and two lateral flights of smaller dimensions, the relative proportion being as 1½ to 2. This type, in more restricted proportions, is employed in many important warehouses, and is well adapted both for a sober style of decoration and for elaborate ornamentation.

Horseshoe Staircases.—This form is chiefly used for outside stairs. Regarded as an element for monumental structures, its effectiveness is very grand. The staircase in the Palace of Fontainebleau is a magnificent illustration of this type. If made of iron, it is specially suited for porticoes with double balustrades. Columns or pillars used for stone staircases are replaced, when the staircase is made of iron, by columns and brackets ornamented to match the taste and style of the building itself for which the staircase is intended.

False Stringboards.—False stringboards are partial stringboards, fitted to the straight part of bays along the line of a staircase; and in such case they are provided with balusters and handrails along the width of said bays or recesses. As stated above, a false stringboard may be made to run round the whole circumference of the cage.

Consolidation of a Stone Staircase (Figs. 21, 22, 23.)—Consolidated staircases are built of volvic stone—a volcanic lava. The straight steps are simply framed into the wall, 10 centimètres deep. Brackets of 40 millimètre square iron carry a double T-iron of 100, that runs at 10 centimètres distance from the extremities of the steps.

Handrails.—The handrail of a staircase must never fall short of 90 centimètres in height in the landing, measured vertically from the nosing to the top of the handrail. The height commonly adopted varies from 90 centimètres to 1 mètre. The distances between the balusters should measure 13 to 14 centimètres in the clear, or, say, 16 centimètres from centre to centre. In ornamental handrails made of wrought-iron, the openings, measured at the sides, should not fall short of 15 centimètres, particularly at the bottom. In schools, colleges, educational institutions, and generally in stairs used by children, it is customary to put knobs made of copper or any other metal at one mètre intervals upon the handrails, so as to provide an obstacle to the indulgence of sliding down along the handrail. There is a question which, though foreign to the purpose of this article, would seem to merit attention on the part of builders. It is the incidence of lights on a baluster handrail. Let us suppose a burner fixed at *a* in Fig. 13, the shadows would fall across the steps along the lines *x y*. Steps polished with wax are apt to be confounded one with the other as we go downstairs, presenting but very slight differences in tone and shade, especially if the stair is built of fine quality timber, and the consequence is that we are apt to mistake the shadow cast by the baluster for the limit of the tread, thus running the risk of taking a false step. This defective arrangement has come under our observation on many staircases, and we believe it can be avoided in a variety of ways. Thus, for instance, if the light be suspended beneath each of the landings, the lines of shadow will be very short, intersecting the step more diagonally.

Method of Setting out Stringboards (Fig. 16).—After chalking out the plan, settling the balancing of winders and dancing steps, let the height of ascent be divided according to the number of steps arranged for, and number these divisions 1, 2, 3, 4, &c. Then, with a pair of compasses, or, better still, with a steel tape, take the breadths of the treads at the straight of the stringboard, similarly to be marked 1, 2, 3, &c. Carry these to the base line, raising them perpendicular to said line. The intersections of the lines bearing the same number will give the angles of each step. Then trace a pattern for a wooden or stone step, and, with compasses opened to the extent of 13 to 15 centimètres, trace small arcs on the most advanced portion of the pattern, the tangential points of which, united between them, will form a broken line, which may be rendered more even by converting it into a continuous curve, which will be the under part of the stringboard (Fig. 16).

THE SANITARY CONGRESS AT BOLTON.

THE recent Congress, held at Bolton, under the auspices of the Sanitary Institute, which closed on Saturday night, passed off successfully, and was well attended. In completion of our report of last week, it may be mentioned that at the closing meeting of Section 1, dealing with Sanitary Science and Preventive Medicine, a resolution was adopted declaring that there are many other medical essays on sanitary subjects, at present in the possession of the Privy Council, the publication of which in an accessible form by the Sanitary Institute would aid the progress of sanitary reform. After the reading of Professor Hayter Lewis's suggestive address to Section II., "Engineering and Architecture," on the planning and arrangement of new towns and suburban districts, reported by us last week, p. 463, several papers were read, the first being by Mr. J. J. Bradshaw, F.R.I.B.A., Bolton, on "Sanitary Apparatus of Convenience in Factories." Efficient ventilation by fans, sound flooring, sanitary water-closets, and an efficient water supply were strongly advocated. A discussion followed, taken part in by Professor Robinson, Mr. Leach (chairman of the Bolton School Board), Mr. Rogers Field, and Mr. Norbury, various suggestions being made for satisfactory ventilation. Mr. Darley, of Leeds, pointed out that the difficulty in suitable ventilation was in the prevention of draughts, seeing that people invariably closed the inlets to prevent draughts and keep up the temperature.

GRAVITATION SUPPLIES OF WATER FOR VILLAGES.

A paper was contributed by Mr. S. Harding Terry, Local Government Board inspector, on "Village Water Supply," in which he advocated the adoption of the gravitation water schemes in districts which were least likely to be affected by drought. In such cases a small water rate, not exceeding 2d. or 3d. per week per house, would be sufficient to meet the cost of providing the works. A paper on "Artesian Wells and Water Supply," by Mr. Robert Sutcliffe, was also read. There were, said the writer, many dangers to be encountered in the construction of those wells, the prevention of the water from contamination with other matters being highly important. He advocated a combination of digging and boring as affording a much safer means of obtaining a water supply than either system separately, and an efficient mode if the bore-pipes were properly constructed, and attached by air-tight connections to the suction of the pumps.

RIVER POLLUTION.

Major Lamrock Flower, secretary to the River Lea Conservancy Board, read a paper on the "Fouling of Streams," regarding the subject from three points of view—the causes of the fouling of streams, the effects thereof, and remedial measures. The removal of sewage by water carriage, born of the introduction of the water-closet, which contrivance, some said, was the invention of the devil, lay at the root of much fouling of streams. He suggested as remedial measures new legislation, with the motto "Thou shalt not," and a shorter course of procedure in punishing offenders. He thought the country should be mapped out in watershed areas, and each put under the charge of an experienced man. The fouling of streams ought to be made a penal offence.—A discussion followed, in which the establishment of sewage farms found favour.

HOUSE DRAINS.

At the adjourned meeting of this Section II., held on Friday, under the presidency of Professor T. Hayter Lewis, F.R.I.B.A., Mr. Reginald E. Middleton read a paper on the question of "House Drainage," in which he advocated ventilating house drains by carrying a pipe from the sewer trap direct to a point above the roof of every house. Complications both in apparatus and in the drains and ventilating

and inspection chambers were most desirable, and economy without the loss of efficiency should be studied. Mr. John Honeyman, F.R.I.B.A., of Glasgow, read an exhaustive paper on "The Size of House Drains, and the Use and Misuse of Traps." He held that unventilated sewers were the root of epidemic diseases, and that to effect the destruction of disease germs, it was obvious they should allow a much larger volume of fresh air to pass through drains than had hitherto been customary. His experience pointed to this: that the best chance of safety lay in so contriving house drains and plumber work that there should not be one single receptacle where stagnation was possible throughout their entire system. Besides plenty of air and good scour, it was essential that if the contents of house drains were to be harmless, they should be regularly cleaned. There was no reason why they should not have drain-sweeps as well as chimney-sweeps.

COTTAGE CONSTRUCTION.

Mr. J. Corbett, sanitary engineer, Manchester, read a paper on "Health, Comfort, and Economy in Cottage Construction." After considering what were the chief requirements of health and comfort in cottages, the paper entered into structural details, and contained recommendations compatible with health and comfort. Mr. Corbett suggested overhanging eaves to protect external walling, also suitable corbellings, arches, &c., instead of fancifully coloured brickwork, a 9in. by 7in. flue for cottages along with a vent flue, coloured tiling for the flooring of kitchens, and hard brick instead of stone window sills. With regard to carpentry, the speaker advocated a plank flooring. The question of substituting the plastering of walls for a thin facing of cement was touched upon, as was also the introduction of a glazed earthenware washing sink for the ordinary stone slopestone.

SMOKE ABATEMENT.

Papers on "Smoke Abatement" were read by Messrs. Herbert Fletcher, of Bolton, D. J. Russel Duncan, secretary of the National Smoke Abatement Institution, and Orland D. Orvis, and on the proposition of Mr. Leach, seconded by Mr. Scott, it was resolved "That the Council of the Sanitary Institute be requested to enter upon an examination into the best method of consuming smoke, and issue the results to their inquiry."

WATER ANALYSIS AND SEWAGE TREATMENT.

Section III., "Chemistry and Geology," was opened on Friday, under the presidency of Dr. August Dupré, F.R.S., who delivered an address dealing with water analysis and the treatment of sewage. The mere working out of an analysis was, he said, comparatively speaking, a simple matter; it was the interpretation of the results obtained that tried the knowledge and experience of the analyst. Many attempts had been made to overcome the difficulty by laying down certain general standards to judge by, waters being divided into good, bad, and indifferent. All such standards were fallacious, and served only as crutches for the ignorant to lean upon. The chemist who thoroughly knew his work did not require them, and those who required them were not fit to undertake water analysis at all. As long as we were dealing with compounds or with non-living organic matters, however injurious they might be, it was possible to state a quantity below which if taken they would not prove injurious; the moment, however, we were dealing with living organisms capable of self-multiplication, that ceased to be the case, for what might be an infinitesimal quantity in the water might become a dangerous quantity in the body of the consumer. What kind of guide, then, did he recommend in analysing water? It was the conformity of the water to or its divergence from the general character of the waters and the district from which it came, or of the geological formation from which it sprang. In other words, district standards and not general standards should be used. From a sanitary point of view the production of sewage, usually so-called—*i.e.*, the water carriage of our house refuse—was a mistake. However, for good or evil, the plan had been adopted, and we must endeavour to dispose of it satisfactorily. The first point that should be clearly understood was, that sewage was a nuisance to be got rid of, and not a thing to make a profit from. The next point was that the sewage of every place should be dealt with separately, for no general scheme would do equally well for all. Whatever scheme was adopted—except the destruction of the sewage material by fire—our treatment of sewage should be such as to avoid the killing of the living organisms, or the hampering them in their action. The treatment of sewage ought to begin in the sewers. Sewers were laid so as to bring the sewage in the shortest possible time from the source of production to the general outfall; but even in towns of moderate size the time which elapsed during the passage of the sewage between the two points was sufficient to render it offensive, at least in summer time; while in large towns the sewage had time to become very highly offensive. While an attempt was made to remedy that, the use of powerful antiseptic disinfectants should be avoided, in order that the action of the beneficial organisms might not be checked. Further, on the score of expense it was practically impossible to really disinfect infectious matter when once it had found its way into the sewers. All that could be done was to deodorise the sewage, and that could be done without interfering with the immediate or subsequent action of the organisms on which we depended for the final destruction of the sewage. The best material for that purpose was, in his opinion, a solution of permanganate of potassium prepared on the spot from crude manganate by the addition of acids or suitable salts. We thus also checked putrefaction and did away with what seemed to be the chief agent in carrying disease germs into our streets and houses—namely, the rising and bursting of gas bubbles from the sewage. When thus treated sewage would arrive at the outfall in a practically inodorous condition, or nearly so, according to the amount of manganate used, and would be fit for any kind of treatment we might wish to adopt. Lime was frequently used in the treatment of sewage, but that material had a tendency to produce in course of time putrefactive changes. Of other methods of dealing with sewage the next best was filtration, and the next was the system of discharging the sewage into a river, and, provided the river was large enough, a community might be justified in adopting that plan where any other would entail on them very great cost.

WATER SUPPLY.

Mr. Percy F. Frankland read a paper on "Bacteriology in Relation to Water Supply," in which he urged that experiments showed no reliance could be placed on the spontaneous destruction of organisms which had found their way into drinking-water, while Dr. Louis Parkes, in a paper on "Water Analysis," declared that with our present knowledge we were unable to ascertain whether water was potent for evil or harmless except by actually drinking the water. Mr. C. de Rance read some notes on "Water Supply in Lancashire."

THE AIR OF BUILDINGS AND SEWERS.

Dr. J. S. Haldane, in a paper on "The Air of Buildings and Sewers," in which he described numerous experiments, somewhat startling in their results, which he has made in conjunction with Prof. Carnelley, of Dundee, said carbonic acid was no measure of the number of micro-organisms in the air of a room. Sewer gas was one of the most free from micro-organisms, and in that respect was twice as pure as the outside air in towns, in summer at any rate. The connection of sewer air with typhoid fever rested, not on satisfactory evidence, but largely on *à priori* reasoning. His observations on the impurities of sewer air would have no weight against any satisfactory evidence showing the connection between sewer air and fevers, but he thought they had greater weight against the *à priori* reasoning on which the sewer-air theory largely depended. He was not arguing that emanations from drains were harmless. The organic and other substances contained in such air might, from their unpleasant smell or otherwise, have a very serious effect on health. In any case the attention given to the means of preventing such contamination was well worth the trouble. But in the present negative state of our knowledge on the subject we should cease to attribute blindly to sewage emanations cases of disease of which we did not know the cause, and patiently seek for convincing evidence as to the real causes, whether those lie in sewage emanations or floor-damping materials, or in the subsoil, or in the water supply, or elsewhere.

A conference of medical officers of health was also held on Friday under the chairmanship of Prof. W. H. Corfield, who directed attention to the sanitation of houses, and the inadequacy of the measures recently brought before Parliament professing to deal with the question. It was decided to make a conference of medical health officers a permanent feature of the Congress.

Addresses were given on Saturday evening to the working classes, when Major Lamrock Fowler spoke on cleanliness; Mr. A. Wynter Blyth, medical officer of health for Paddington, on self-help; and Mr. H. Law on thrift.

VISIT OF THE SOCIETY OF ARCHITECTS TO YORK.

DURING next week this society will hold a series of meetings in York, and make excursions in the neighbourhood in connection with the York Architectural Association. The meetings will be held at the Church Institute. Detailed notices of the visits, &c., will be posted on the notice board of the Church Institute. All information may be obtained from Mr. Edgar Farman, hon. sec., or Mr. G. A. T. Middleton, secretary Society of Architects, or Mr. George Benson, A.R.I.B.A., hon. sec. York Architectural Association, 25, Blake-street, York.

PROGRAMME.

Monday, Oct. 3rd.—Gentlemen from the South travel down by the 10.35 a.m. train from King's Cross. 3.30 p.m.—Reception at the Church Institute and conducted walk round York. 7.30 p.m.—Discussion: "The Architects and Engineers' Bill," paper by Mr. Hugh Roumieu Gough, F.R.I.B.A., Vice-President Society of Architects. Mr. W. Hepper, President of the York Architectural Association, in the chair.

Tuesday, Oct. 4th.—Visit: Selby, Beverley, and Hull, train leaves York 8 40 a.m. 7.30 p.m.—Discussion: "Yorkshire Architectural Art," paper by Mr. W. Hepper, President Y.A.A. Mr. Hugh Roumieu Gough, F.R.I.B.A., Vice-President Society Architects, in the chair.

Wednesday, Oct. 5th.—Visit: Kirkstall Abbey and Adel Church; train leaves York 9.7 a.m. 7.30 p.m.—Conversazione by the York Architectural Association in the Water-colour Galleries of the Yorkshire Fine Art Institution.

Thursday, Oct. 6th.—Visit to Ripon Minster and Fountains Abbey; train leaves York 7.30 a.m. 7.30 p.m.—Discussion: "Architects' Charges," paper by Mr. Edgar Farman, Mr. A. Pollard, Past President Y.A.A., in the chair.

Friday, Oct. 7th.—Visits: 9.0 a.m., St. Mary's Abbey School for the Blind and Manor House; 11.0 a.m., York Minster and Minster Library; 3.30 p.m., Heslington Hall. 7.30 p.m.—Discussion, "Yorkshire Building Stones." Mr. W. H. Seth-Smith, Vice-President Society of Architects, in the chair.

ENCAUSTIC TILES.

MESSRS. MALKIN, EDGE, AND CO., Burslem, Staffordshire, have opened an office and show rooms at No. 29, Sandringham Buildings, Charing Cross-road, W.C., for their patent encaustic tiles, so favourably known to architects and the public. The new show rooms are conducted and carried on solely by the firm, under the management of Mr. James Cope, whose experience and knowledge of the business are a guarantee of efficiency. The new show rooms contain a large variety of tiles, made in every style suitable for floors, halls, wall linings, dadoes, hearths, firegrates, and other decorative purposes. We would draw the reader's attention to the excellent quality and make of the tiles manufactured by Messrs. Malkin, Edge, and Co., their nice and varied colours and arrangements of tint. We noticed some very effective tile dadoes, one an upright panel in shades of blue and buff. The panel itself was of dark maroon colour embossed with a folial pattern; round it was a light blue border with margins of darker shades of warm colour, upon a ground of buff tiles. The glazed tiles in browns, reds, and greys are very suitable for wall decoration. For hearths and grate-cheeks a large assortment of patterns are on view, including majolica tiles, incised and embossed in browns, greens, and greys. Strong features of the exhibition are the specimens of art-painted tiles suitable for wall decoration and fireplaces. One of these is a

tile panel entitled "Le Cabaret de la Fleur-de-Lys," painted with much skill and delicacy, well adapted for the decoration of a buffet or restaurant, and we understand this class of art work is to receive considerable attention in the future. If the subjects are well chosen and tastefully painted, avoiding the use of bright and showy colours, we believe art-painted tiles will be a welcome accessory in public buildings and domestic apartments. Some of the emblems and devices painted in monochrome are worth attention, especially a small well-painted landscape on one tile. Besides painted and embossed tiles for jambs and wall decoration, there are several patterns intended for flower-boxes, and a variety of tinted glazed tiles. The arrangements of tiles for floors are exceptionally good.

BOOKS RECEIVED.

Durrant's Handbook for Essex (Chelmsford: E. Durrant, 90, High-street; London: Simpkin and Marshall) is a new guide to that county, compiled in a readable style by Mr. Miller Christy, an authority on antiquarian subjects relating to Herts, Essex, and East Anglia. In the introductory chapter, Mr. Christy describes the peculiarities of his native county, referring to the fact that there are practically no waste lands, the whole area, with very slight exceptions, being productive and fertile. In historic and antiquarian interest Essex yields to few counties, being scored over with Roman roads, and containing no fewer than five Roman stations, while the later records are full of incident. The geology of the county receives exhaustive notice, and the ancient camps, the remarkably fine series of Tudor and 18th-century mansions, and the remains of the 47 religious houses which existed prior to the Dissolution, are the subjects of other notices. Owing to the complete absence of building stone, the churches are admittedly rather poor. They are of all periods, the best being the Early Norman church of Watham Holy Cross, and next it in interest the Perpendicular churches of Thaxted, Saffron Walden, Dedham, Coggeshall, and Dunmow. Reference is made to the octagonal tower of Hockley Church, and to the six examples of round towers; but we observe Mr. Christy neglects to note the almost unique (and unpleasing) example of a triangular tower at All Saints, Maldon, to which the only parallel that occurs to us is Tresham's well-known Lodge at Rushden, Northamptonshire. The towns and villages are succinctly described in alphabetical order, and while the earlier works of Morant, Cromwell, and White have evidently been consulted, the errors of omission and commission have been, so far as we have tested the statements, rectified, and the material is presented in readable, concise fashion. The little book is illustrated by an excellent map of the county brought down to date, the Great Eastern Railway extensions from Shenfield and Maldon to Southend and Burnham, and the Tilbury Co.'s direct route between Barking and Pitsea, both now in progress, being shown as opened, and by a reliable plan of Colchester.——*Land and Houses*, by JOHN PARNELL (London: Effingham Wilson and Co., Royal Exchange), is a new edition of a useful and concise handbook for intending investors in freehold and leasehold ground-rents, houses, and land. The cautions as to what to look for and to avoid will afford many useful hints to would-be purchasers, and at the end of the book are tables showing the rates of interest on purchase money, and the number of years' purchase equivalent to such amount.——*Gasworks Statistics* and *Waterworks Statistics* (Scientific Publishing Co., 22, Buckingham-street, Strand) are new and enlarged issues of Mr. C. W. HASTINGS'S carefully-compiled particulars as to English gas and water undertakings.——From the same publishers we have also received the *Gas and Water Companies' Directory*, a useful book of reference, also by Mr. C. W. HASTINGS, and *Rating Gas and Water Undertakings*, by WILLIAM GRIFFITH, B.A., Barrister-at-Law, which sets forth in a clear manner the principles on which rating is based, and the complicated Acts and judicial decisions by which the practice is regulated, and goes on to detail the procedure by which valuations are enforced. Such a handbook is calculated to be of service to both rating authorities in reducing friction, and minimising appeals and litigation by showing the basis on which claims should rest.——*Midland Churches* (12, Southampton-street, Strand) is a sixpenny reprint from *Church Bells* of twenty-eight full-page woodcuts and descriptions of notable churches in the Midland Counties. The letterpress seems reliable, and is compiled from an ecclesiastical, rather than architectural, standpoint; the illustrations suffer from failure in sympathy on the part of draughtsman or engraver with the details of Gothic work.——*Benham and Froud's Catalogue and Price List* (Chandos-street, W.C.) of their braziery goods, art metal and woodwork, and general metal work is well illustrated, and will be found useful to the architect and builder as well as generally to those furnishing.——*The Trade Signs of Essex*, by MILLER CHRISTY (Chelmsford: E. Durrant and Co., 90, High-street, and London: Griffith, Farran, and Co.), is a popularly written and illustrated account of the origin and meaning of the publichouse and other signs now or formerly found in the county. The author classifies the signs of the 1,355 inns and publichouses now existing in Essex, and shows that these, with those which have disappeared during the past two and a half centuries, include 693 distinct varieties. Of these heraldry accounts for the origin of a very large number, and the chapter on heraldic signs will be found by many one of the most interesting in a well-written book. Mammalian signs follow, and comprise more than one-third of the total signs, although there were but few over a hundred varieties. Birds are responsible for eighteen distinct signs, insects for two, and fish for but one. Signs of human and astronomical origin account for nearly all the other varieties. The illustrations are culled from many sources, and include some good examples of wrought-ironwork, notably the brackets of the Leather Bottle at Pleshey, near Great Waltham, the spaces in which are filled with well-designed scrollwork, dated 1778; the scrolls surrounding the sign of the Rising Sun, at Castle Hedingham, and the Boot, at Bardfield, are also good examples. Mr. Christy has delved into almost virgin soil, the only other work of any value on the subject being Larwood and Hotten's "History of Signboards," written twenty years ago, and treating mainly on London signs, and he has dealt with his materials in an interesting and readable manner.

STORM-WATER CONDUITS.

THE size of sewers or conduits to carry off water from a given area so quickly as to avoid disastrous flooding is one of the questions to which the attention of engineers has to be drawn when providing a system of sewerage for districts. The local conditions often make the formulæ used for determining size worthless. The area to be drained, the inclination of the sewer, the rainfall during storms, and the soil, whether permeable or otherwise, are important factors. Weisbach's formula for discharge, assuming the sewer to run three-fourths full when discharging one cubic foot per second per acre, has been adopted in proportioning the sewers of the City of St. Louis. This formula, adopted by R. Moore, is that the diameter of sewer in feet $= \left(\frac{A^2}{10{\cdot}33\ s}\right)^{\frac{1}{5}} A$, denoting area drained in acres, and s = grade of sewer in feet per hundred. The Kutter formula gives a better discharge, and tables have been given in a paper by R.E. McMath in the Transactions of the American Society of Civil Engineers. It has been found that where overcharging existed it was due often to insufficiency at some other part of the sewer. The effect of two sewers meeting is often to destroy the velocity below the junction. The tables furnished by the author are of interest, as they show the different discharges by these formulæ. The St. Louis rule makes smaller allowance for discharge than the Burkli-Zeigler formula for areas less than 60 acres, and less than the new rule of St. Louis up to 80 acres. The formulæ generally used are not satisfactory. Considerable differences are shown in the tables of Mr. McMath. The tables and diagrams of capacities of sewers are of value, and the deductions of the writer seem to be based on experience. We may mention that the proportion of rainfall that reaches the sewers, after allowance for evaporation and absorption, is for St. Louis three-fourths of the rainfall, though in any given locality the judgment of the engineer must be taken. The surface, whether paved or not, and the porosity of the soil, the number of buildings on the area, are important elements.

THE ORIGIN OF CHRISTIAN CHURCH ARCHITECTURE.

THE generally accepted view as to the origin of the form of Christian Church architecture is that until the conversion of Constantine, the Christians were not allowed to erect special buildings for their worship, and were therefore obliged to meet in private houses or in the catacombs; and that although they might sometimes by special favour obtain the use of some building of no external appearance, they were not allowed either in extent or decoration to attempt any rivalry with the temples of the pagans. But, it is further said, when Christianity became publicly recognised, the Emperor made over to them some of the old pagan basilicas, which they immediately occupied as churches, and they afterwards erected new buildings, which they called by the same name, Basilicas, in imitation of these pagan structures, which thus became the original models of Christian churches. These views do not rest upon any direct statements of ancient authority, but it appears were first promulgated by the earliest modern writer on architecture, subsequent to the revival of letters,—Leon Battista Alberti, of Florence, in his work "De Re Ædificatoria," A.D. 1485, echoed by Ciampini in his "Vetera Monimenta," A.D. 1690; and they have been repeated in almost every English treatise on the subject, including Mr. Burges' paper read before the Institute of British Architects in June, 1853, the "Dictionary of Christian Antiquities," and the new edition of the "Encyclopædia Britannica" (s. V. "Basilica"), without the slightest hint of question or dispute, except in the Architectural Publication Society's "Dictionary of Architecture," although a long controversy upon the subject has been carried on in Germany for nearly forty years, beginning with a learned treatise by Zestermann, entitled "Die Antiken und die Christlichen Basiliken" (The Antique and the Christian Basilicas), published at Leipzig in 1847. The present Professor of Fine Art in the University of Edinburgh, however, calls the statement very seriously in question in his new work, entitled "From Schola to Cathedral,"* and supports his views by historical references and arguments of such a nature as to deserve careful and respectful consideration.

Mr. Baldwin Brown holds that although the pagan basilica may account for several features of the Christian meeting-place, it by no means accounts for all. He observes that in the fourth century, when Christianity was first fully and openly tolerated by the edicts of Constantine, we find its meeting places represented by imposing buildings of distinct plan, and with an elaborate system of appropriate decoration, which presuppose many tentative efforts during the preceding centuries. There are, however, neither any actual remains of Christian buildings or formal descriptions of them in any writings of the period, and in the absence of such memorials their probable form is to be gathered from indirect allusions, and from the general position of the early Christian communities in the Roman world, and their outward features of resemblance to other religious associations or clubs, both Jewish and pagan.

The very earliest meeting place of the Christians was the "upper chamber," mentioned in the beginning of the Acts of the Apostles, where the whole community of 120 persons gathered together, and performed their first acts of church government. Not long afterwards we read that they met daily "in Solomon's porch" of the Temple of Jerusalem. As they spread through Asia Minor and Greece they at first availed themselves of Jewish synagogues, the Christian meeting-place being expressly called a synagogue in the Epistle of St. James (ch. ii. 2, marg.), and probably for the greater part of the first century the Chris-

* From Schola to Cathedral: a Study of Early Christian Architecture and its Relation to the Life of the Church. By G. BALDWIN BROWN, M.A. Edinburgh, 1886.

tians presented the outward aspect simply of a sect of the Jews. Such separate meeting-places as they had were—if not public halls, hired for temporary use like "the school of one Tyrannus" at Ephesus — large apartments within the private residences of wealthy adherents. The meeting-place at Troas, where Eutychus fell from an upper chamber on the third loft, was of such a nature; in the city of Rome the meeting-place was in the house of Aquila and Priscilla; at Colosse in the house of Nymphas; Philemon held a church in his house; and at Rome, St. Paul preached in his own hired house. This practice by no means passed away with the first ages; but continued until Christianity was established. In this matter the Christians followed the example of the heathen religious colleges, respecting which Tacitus ("Annals" i. c. 73) records that they held meetings "from house to house"; and an inscription quoted by Orelli-Henzen tells of a "college" in the house of Sergia Paullina. In the early Christian romance known as "The Recognitions of Clement," reference is made (iv. 6; x. 71) to such a hall in the house of one Maro, said to have been afterwards Bishop of Tripolis, which was used by St. Peter; and of the gift of another to the church by Theophilus, afterwards Bishop of Antioch. Mr. Brown conjectures that it was a maxim of church polity to secure men of wealth and station for bishops, whose houses might afford advantageous positions for extension of the operations of the church, and that these ancient houses were a little later easily transformed into monasteries. "The arrangement of the Mediæval monastery," he says, "recalls that of the ancient houses. The cloistered court is the *peristyle*; the church, the refectory, the chapter-house, and other apartments round it correspond to the *æci* of classical times, and the resemblance may be due to this derivation." These apartments were richly decorated, and such decorations may have had a powerful influence in inducing the Christians to apply similar ornamentation to the walls of their churches. An anti-Christian dialogue, called "Philopatris," formerly ascribed to the poet Lucian, describes a Christian gathering in "a handsome room with a gilded ceiling up a long winding staircase," and an ancient document known as "Gesta Purgationis Œciliani") printed in the appendix to St. Augustine's works (Vol. IX. p. 794, Migne), gives a graphic picture of the Christians assemled in such a place on the occasion of a persecuting State inquisition, with a list of the furniture and some mention of subsidiary rooms in the same building used by them.

But besides these ordinary apartments in private dwellings, there were in some large mansions—especially in the imperial palaces—*private basilicas* of great magnificence, both as to proportions and decorations, differing, however (though with many common features), in several important respects from the great public basilicas. These apartments are mentioned and described by Vitruvius. That in the palace of Domitian is referred to by Plutarch as an example of architectural splendour, and it so happens that is the only private basilica of which any portions are still remaining. The end is occupied by a semicircular tribunal, in the construction of which the same considerations operated as in the construction of Christian churches—namely, the necessity for focussing the interior by means of one all-dominating feature. "Just as the crowds that waited upon the nod of Cæsar, when they entered the hall of judgment turned their eyes at once to the tribunal where he sat enthroned, so the innumerable multitude which thronged the churches were conscious from the first moment they entered the building that the altar, and those about it, formed the one centre of interest for all." Such was not, however, the case with the larger public basilicas, hitherto supposed the originals of our churches, where both, according to Vitruvius and Plutarch, the apse or tribunal was separated by columns and a gallery from the main building for the express purpose of quiet and privacy.

But, although there were Christians in Cæsar's household from the earliest times, who would have been familiar with these magnificent private halls, and who might possibly have used them for meeting places, Mr. Brown thinks their use was hardly common enough to have had much direct influence on the form of the churches, and he looks, therefore, to other buildings more generally used as the true originals. These were (1) the lodge-rooms, "scholæ" of religious associations; (2) the "cellæ" of the cemeteries. The number of associations was one of the most striking features of social life during the first centuries of the Christian era. There were then, as now, trade and dramatic guilds, athletic, burial, and dining-clubs, literary and financial societies, and, with the exception of scientific associations, there was scarcely an object for which men now combine for which they did not combine then. Almost all of them had more or less of a religious element, like our own mediæval trade-guilds; but in a very large number religion was the basis and bond of union.

Hence, the formation of the early believers into societies was by no means an isolated phenomenon. To outside observers they were in the same category as associations already existing. They had the same names for their meetings, some of the same names for their officers; and their basis of association, like the others, was a common religion. The number of such associations was so great that they literally honeycombed the Roman Empire, and they were regarded with favour or disfavour by governments, according to the supposed predominance in them of religion, charity, or politics. Their technical names were, in Greek, ἑταιρεῖαι ("hetæriæ"), and in Latin, "collegia," "sodalitates," or "sodalicia." "Nowhere," says Mr. Brown, "would the early Christians have found ideas and habits with which they had more in common than with these societies. . . What wonder, then, if they came to conform themselves in large measure to the practice of these *sodalicia*, and so gave cause to the Roman authorities to apply the same laws to both." These societies had, as one of their institutions, a lodge, or meeting-room, called "schola,"* where they held their gatherings, and assembled for common meals, to which each member brought his share of provisions. On the Capitoline plan of Rome there are indicated several small oblong buildings, and there are remains of others near the forum at Pompeii which have an apse or semicircular formation at the end farthest from the entrance which were probably the *scholæ*, or meeting places, just mentioned. The words of St. Paul seem to imply the possession by the Corinthians of a similar place of meeting, where a meal was eaten in common, and the memorial bread and wine was passed round. These associations and places of meeting existed among Jews as well as pagans, and it is not likely that the heathen would perceive much outward difference between their own societies and those of the Jews and Christians. Tertullian (*Apol.* c. 39) says that the funds voluntarily subscribed at the meetings of Christians were spent "to support and bury poor people"; and the investigations of the last twenty years have made it certain that the early Christians copied most especially the procedure of the funeral colleges, under cover of which they had the best chance of escaping attack. No object was held more sacred than the performance of sepulchral rites, and however much the Government or the populace might be subject to fits of suspicion or fury against other societies, the burial clubs were always treated with great tenderness and respect. "It is evident to me," writes De Rossi, the great modern explorer of primitive Christian monuments and inscriptions, "that the Christians made use of the funeral colleges, and that the emperors who were well disposed to them, or, at any rate, not persecutors, availed themselves of the pretext to tolerate the assemblies of the faithful, and to permit the Church to establish itself little by little as a corporation in the bosom of the Empire." The Christians held their cemeteries under a title like that of other burial associations, and the *area* of them presented mostly the same external appearance, containing gardens, houses for the caretakers and *fossores* or sextons, *cellæ*, or monumental buildings above ground, and covered entrances to the subterranean catacombs. Whatever opinion may be held as to the general right of Christians, previous to the famous Milan edict of Constantine and Licinius (A.D. 313) to hold other kinds of property in common, there is no doubt that they might acquire common property in cemeteries; and also, generally speaking, perform what ceremonies they liked therein in the upper air. So much is plainly implied in an edict of Valerian (A.D. 357), forbidding for the first time Christian assemblies and visits to cemeteries, but which was set aside three years later by a more tolerant edict of Gallienus (A.D. 360). Thus the Christian cemeteries became the surest and safest rallying places of the infant church; they also received a peculiar consecration as resting places of the remains of venerated saints and martyrs. Following the practice of other burial associations, it became a custom for the whole body of the faithful to assemble at these sacred spots for periodical funeral feasts in memory of the departed. Early and direct evidence of this custom is found in the "Acts of Martyrdom" of St. Polycarp (A.D. 155), and remaining inscriptions show that the cellæ and area were not unfrequently presented to the Christian communities by believers for church uses. In times of danger the meetings would be removed to the crypts below the cemeteries where the bodies of the martyrs lay at rest, and the holy ceremonies could be performed with the sarcophagus itself for an altar. The literature of the period is full of notices of these cemetery meetings, and they became so popular at last that Jerome boasts, "the city is moved from its seat, while the torrent of the populace sweeping past the ruined shrines (of idolatry) pours forth to the martyrs' tombs." These burial places having been necessarily outside the cities accounts for the fact that many of the mightiest Christian fanes are outside the walls of *ancient* cities—as, for example, St. Peter's, on the Vatican, St. Paul's, on the road to Ostia, and many others. As the throngs increased who visited these spots, the small *exedræ*, or chapels, grew into enormous churches, but always with the same dominating feature of the apse or chancel for the clergy, containing the martyr's tomb, with the holy table or altar in the chord of the apse, or well in view, and facing the congregation placed in front.

Thus Mr. Brown maintains that the Christian architecture had, as it were, several root-fibres traceable to non-Christian origins, which united to form the historical church. These were: the Jewish synagogue; the halls of private houses, including the *private basilicas* or halls of audience of Roman princes and nobles; and the *scholæ*, or lodge-rooms, of Roman associations or clubs, which gave the Christians just what they needed for simple utility, and wherein the Christian altar occupied the place of the pagan, and the church officers those of the club presidents. But the highest development, which went beyond mere utility and became the expression of Christian joy and triumph, were the *cellæ*, called by Eusebius, "Trophies of the Martyrs," erected over their tombs. These were the true sources of the expressive art language of Christian architecture in form and decoration which subsequent ages have so elaborately worked out in the varieties of church architecture in Christendom.

In the latter part of his book Mr. Brown traces the architectural forms of churches from these originals, through the Domed, Byzantine, and Mediæval styles, and of their modifications by Teutonic influences; and gives cogent reasons why the ordinary theory of the origin of Christian churches from the public pagan basilicas can no longer be held tenable.

W. H. R.

* The word survives in the Italian "scuola"—a lodge or meeting-room.

NOTES ON ETRUSCAN ARCHITECTURE.

IT is somewhat surprising that, considering the position once held by Etruscan architecture in the world, so little of it should remain to make its mark upon modern times. The Etruscans, who made their appearance in Italy after the Pelasgi, the first known builders of whom there is any trace, hailed from the north, according to report, at a date varying from 1050 to 1300 B.C. Whether Germany was their home, as some think, is immaterial; it being much more to the point that the chief settlements in Italy occupied a rather larger area than the present province of Tuscany. The Etruscans were a flourishing and energetic people, who lost no time or opportunity

of extending and consolidating their possessions. It was, therefore, to be expected that they would leave behind them, more or less, traces of their presence, and accordingly we find them not in any profusion, and principally taking the form of religious worship and respect to the dead. Both these influences were strong with many of the ancient nations, and the result amongst the Etruscans was that their architectural remains are chiefly in the form of temples and sepulchres; though their history is very vague, we are enabled to draw upon the descriptions of Vitruvius and other old writers. Nevertheless, this class of remains is not common, the probable reason being that there was a deficiency of compact stone, so that the builders of that race had to fall back upon the plastic clay, of which there was great abundance. That architecture had assumed a definite type, even at that early age, may be gathered from the fact that Vitruvius speaks of a Tuscan order, although he does not seem to be aware of what were the principles of that order. He also mentions capitals and decorations in terracotta of architraves in wood. Pliny, too, alludes to Tuscan architecture, laying down a canon, that in the construction of a temple the breadth should be three times the height of the columns; and this we find to be the proportions generally in most of the temples in Sicily, and also in some of those in Greece. Later historians all agree that the Etruscans possessed a bold and determined form of architecture, Dionysius especially mentioning that they built walls of great strength and in the fashion of towers and fortresses, from which they obtained the names of Tyrrheni or Turreni. It is not likely, therefore, that Etruscan architecture, having once gained a character of its own, should have remained stationary, but rather that it kept on improving and suggesting varied forms of ornamentation.

One of the salient features was the *atrium*, from whence, it is said, that the Venetian town of Adria, an undoubted Etruscan settlement, took its name. The Etruscans are stated by Diodorus Siculus to have first introduced vaulting, though he has only tradition to back him up in his assertion. Nevertheless, he is borne out by the fact that notable examples of that are seen in the undoubtedly Etruscan towns of Perugia and Volterra, and also in the Cloaca Maxima of Rome. This grand arched tunnel extends underground for 800ft., built of blocks of reddish tufa; and although it is traditionally attributed to Tarquinius Superbus, the late Mr. Fergusson considered that it was by far beyond the means and requirements of a city of the size that Rome then was. Archæologists, in general, have, therefore, have assigned it to Pelasgic or Etruscan times, and there can be little doubt but that, taken into consideration with the arch, the cloaca belongs to the latter. The chief characteristics, then, of the Etruscan builders were, in a word, a marked broadness or strength, accompanied, as a rule, by sparse ornamentation; and they doubtless imparted to the Romans the secrets of the arch and vaulting.

Taking, first of all, the religious edifices, we find that the Etruscan temple was quadrilateral in shape, divided transversely into two portions, the anterior or *pronaum*, entered by a flight of steps and through a portico, the posterior subdivided into three chambers, of which the middle was considerably the largest. As a rule, the Etruscan columns were exceedingly plain in their capitals and vases, an example of which is shown in what is known as the Column of Cucumella, which resembles the Doric order. Occasionally, however, we find them with volutes and leaves, but of a different type from Ionic or Corinthian.

In the construction of their sepulchres the Etruscans followed a regular ritual, and from the more numerous opportunities of examination, it would seem as though the cross was the motive throughout. Etruscan tombs are divided into those constructed in a primitive age, somewhat resembling the tombs of the East; hypogees, which show Italo-Greek influence; and others, which others believe to show Roman influence. Many are underground, excavated in rock, as at Vulci; others are built above the surface; some are plain, others richly adorned with columns and cornices, as at Castel d'Asso and Norchia. The Etruscan tombs have been divided into—

1. Subterraneous in level plains:
   (*a*) With subterraneous chamber and tumulus. Ex. Tarquin's Tomb.
   (*b*) Without tumulus, but with subterraneous room and vestibule. Ex. Tombs of Vulci.
2. Excavated in hilly and rocky country:
   (*a*) With doors, vestibule, and chamber. Ex. Tombs of Tuscanella.
   (*b*) With façade and sham door, with moulded jambs. Ex. Norchia and Castel d'Asso.

There is a good example of a warrior's tomb at Cervetri, painted with arms and shields; also the tomb of the Due Sedie, from the seats placed between the three doors. Many tombs were surmounted by a pyramid based upon a parallelopiped, crowned with a heavy cornice, as at Castel d'Asso. A sham ornamented door was the only thing that enlivened the blind wall. It seems rather curious, however, if, according to the Etruscan belief, the dead is *en rapport* with the living, any hole would have done, and, in fact, many tombs are found so, as at Castel d'Asso, Toscanella, Vulci, and Sorana. One of the finest tombs in the country is that of the *Tomba supraposti* at Tarquinia, near Corneto. It is dug out of tufa, with a roof like a canopy, and hangings; the light enters by a rectangular aperture at the base, and inside are some remarkable sculptures. Other interesting tombs are the Volunni at Perugia, at Orvieto (singular paintings), of Marzobotto and Villa Nova, near Bologna, and the tombs at Albano, which have been the subject of a great deal of discussion. Also very interesting in an architectural point of view is that discovered at Norchia, the capitals of the columns being of the order called Tuscan by Vitruvius. Sardinia possesses singular buildings, believed to be of Etruscan origin, or some say by the Phœnicians or Carthaginians. They are called *Nuraghe*, but Signor Crispo, the archæologist, questions their being sepulchral, considering them rather as habitations of the nobles. The etymologist bears this out, *Nur* meaning fire (habitations) in Oriental language, and *hag* or *hagst* great. Others maintain that they were fire altars, similar to the *talegot* of the Balearic Islands. Externally, they are of a fortress-like character, with a cone of masonry standing up from an equally massive base, spreading out horizontally, and with a most minute door spreading at the base of the cone. In the interior are two or three cruciform chambers, out of all proportion to the massiveness of the masonry. In some cases solid furniture and idols have been found here; but the whole thing is wrapped up in great mystery.

As to the Etruscan civil architecture, the Arch of Augustus at Perugia is most probably Etruscan, though some, looking at the inscription COLON-VIB, consider it as Roman, of the time of Augustus. Perhaps it belongs to two different eras—that the arched portion of it is Etruscan, albeit the ornaments and pilasters with Ionic capitals are Roman. It is doubtful whether the Amphitheatre of Sutri is Etruscan or not, though all agree as to the gateway of the ancient inclosure of Volterra, with its three coarse heads, notwithstanding that some consider that the gates were placed there posteriorly to the entrance. Although it is not of æsthetic beauty, the nineteen cunei which form the arch are wonderfully harmonious and well put together. The Cloaca Maxima is a splendid example of Etruscan architectural skill; so is also the temple at Rome erroneously called Vesta, which has three concentric arches, the travertine cunei standing forth without cement. We may mention, also, the ruins at Fiesole, Arezzo, Faleria, and the fountains in Tusculum.

FURNITURE BEADS AND MOULDINGS.

I DO not intend in the present article to enter into the architectural character or geometrical principles of mouldings; it is with the manner in which they are fitted and applied I wish principally to speak. I will take beads first, and may here mention that in cabinet-work the term bead is employed differently from in building construction, being given to the astragal, the bead, and the torus, the definitions generally used being raised or sunk beads—beads forming parts of mouldings I omit for the present. The following are amongst the most frequent forms that occur: Scratch beads, loose beads for inside work; beads single and double, on doors working together and on edges; and reedings, a series of two or more worked together.

Simple loose beads are always applied from the inside to secure some portion of the work, such as a panel in a door frame, or a back, or for transparent glass or other accessory fitting. Their thickness is rarely more than from $\frac{1}{4}$in. to $\frac{3}{8}$in., their width is from $\frac{1}{2}$in. upwards, depending, of course, upon the nature of your work, thickness of framing, panel, &c., and also whether they are to stand up or down. As a rule, $\frac{1}{2}$in. panels in 1in. framing will take a $\frac{3}{8}$in. bore bead. The beads can stand up if the inside fittings will not interfere with them when the door is closed. You can easily see which plan to adopt by placing the door frame upon the work without the panels and noticing the position of the inside.

These beads are best made in lengths of from 3ft. to 4ft. If required for smaller work, you can make each length work a side and top or bottom, and cut it afterwards. It is advisable to use a piece of wood wide enough to make several, as this is handier to work; both edges having been shot and rounded over, gauge the bead off the requisite width from both sides and edges, and it will break off clean. Now shoot the underneath edge of these square, mitre them lightly to the work, and secure them by brads, placed at intervals of about 6in. apart.

Single Beads are used for edges, fronts, faces, &c., from $\frac{1}{8}$in. to $\frac{3}{8}$in. wide; those of $\frac{1}{4}$in. and $\frac{3}{16}$in. are the sizes most used. There is nothing special in working them; planes are made for this purpose. It is, however, advisable to have the surface finished beforehand, scraped, and papered; it does not then have to be touched afterwards, and there is no danger of flatting the bead.

Double Beads are sometimes used as mouldings and applied to work, but more often they are worked on it either lengthwise, crosswise, or diagonally; a series of three are occasionally used, but two of about $\frac{1}{4}$in. ($\frac{1}{4}$in. each) most frequently; they are termed *reeding* or *reeded beads*. When working these you will require a straightedge to form a guide for the plane. After finishing the surface it should be set out as the reeds are to be worked, care being taken to do so exactly, and to set the plane on the work, and the straightedge true to it. Now secure it firmly; this is best done by handscrews, which should be so arranged as to be clear when working. You will find it advantageous to use a moderately wide and not too thick straightedge, say about 3in. to 4in. wide and $\frac{3}{8}$in. thick.

In working crosswise or diagonally great care is requisite. Shaped beads of this kind are worked with circular bead routers, which act in the same manner as a spoke-shave.

Projecting Beads.—I intend speaking of these where fitted distinctly, and not where they form part of another moulding. These generally occur in one of the following varieties: On the face of anything, in which case they are applied from the front, and are held principally from the back; to the top, as in a frieze secured by the upper surface; to the bottom, a reversal of the preceding, but one that in many cases makes a great difference structurally; and to the sides: these are adopted where work of the same nature meets, as in doors at the joints of their edges, a bead being fitted to one which, when shut, closes over the other.

I will take the first case, and assume that we have to fix a bead to a piece of work so arranged that it can only be applied from the face, that it is of an ordinary nature, and that the bead is, say, $\frac{3}{8}$in. thick. After preparing the wood and rounding its edges, the bead should be gauged and sawn off; allow a trifle for working in doing this. I may add that it is best to finish it before fitting on, as it is impossible to do it so well afterwards without injury to the ground work, and it is handier when in a large piece (previous to cutting) to work.

After cutting, level the back with a plane and tooth it. You will find this rather an awkward operation; but if you run a hollow in a piece of wood sufficient to take the bead

reversed, and allow it to fit well, it will steady it whilst working. The surface of the work should now be taken down to receive it. If possible, mark this with the gauge—that is, let the gauge mark be the one for the bead to fit and rabbet beneath to a depth of $\frac{1}{16}$in. or so. Now cut the bead to the front, glue it well, and press it firmly, so that the back edge is down to the work and the upper portion to the gauged part. After allowing this to set, the remainder may be mitred round in the same manner, care being taken not to force the first off in fitting.

In the *second* example, where held by the top, the wood must be got out the *full* width of the work—it is, in fact, preferable to allow rather more. The bead is now worked as usual on the edge and the remainder planed true; the amount of the projection is now lightly marked on it by one or two fine points at intervals with a striker, or by a gauge mark. The surface is then toothed, and also the one to which it is intended to fit it. After glueing, set it to the marks and handscrew down, taking care that in applying the latter you do not draw the work out of position.

The projecting inside edge can be levelled when dry. When beads of this nature are shaped, it is advisable to get them out rather wider than when straight. They can be most accurately marked from the work, which will of course be finished, with the exception of the mouldings. The wood being temporarily and placed in the work and fixed, the inner lines or marks can be made by running a compass round, and if the bead is worked true to this, inaccuracy is impossible.

With beads fitted to the bottom, simply a reversal of the preceding, the same directions apply; but examples occur where it is better to differ from this. As a general, though not invariable, rule, these beads are applied to work standing upon something else—that is, the bead is used in small work at the various parts to break the joint, as it is termed, and there are other structural reasons which I shall afterwards refer to. Now, it is preferable in the majority of cases, instead of fitting the beads to the upper portion of the work, and this to the lower, to fit the beads to the lower and the upper to them. This is a very important principle, and one which embodies a great saving of time, it is better so far as strength is concerned, and facilitates working in more than one respect.

I will give one illustration, and others will suggest themselves to you. Take a small cabinet or box forming the upper part of a piece of furniture like a fancy table, &c., to which it is fitted, and having perhaps a pair of small doors in front. The beads should be set on the lower part of the work so that they will show evenly when the top part is in position and closed, the points are marked as usual, and the beads well glued down to the surface.

Beads fitted to the Stiles of Doors, or Parting Beads.—After the doors are hinged and fitted, the bead is applied to the right-hand one, the edge being previously rabbeted out to about half the bead width to receive it. The bead is now glued to this rabbet, and when dry fitted to the other, the under surface being taken out sufficient for it to shut upon the other door level.

In turned work, beads, both raised and sunk or scratch, are frequently employed. The former are the only ones to which I need refer. In work in which the various parts are traced, the manner of putting together is generally by pins fitted to holes or mortises. Take, for example, towel airers, some kinds of table stretchers, and spindles placed between an upper and a lower rail. The construction in all is the same. The exact length of these parts should, before turning, be marked from these marks, the pins are turned the requisite size, and also *raised beads* against them. These beads in putting together will form at each joint a *shoulder*, which is, in fact, analogous to the square one employed in an ordinary tenon.

T. H. S.

(*To be continued.*)

An exhibition of home arts was opened at Kirkby Lonsdale on Friday. The exhibits consist chiefly of handicraft articles made in Westmoreland villages, including clay modelling and carving in wood and stone.

WAYSIDE NOTES.

THE King of the Belgians is about to have a "lodge" built near Brussels, which is to be after the manner of some building that can be seen from the railway between Dover and London. Whilst performing this journey — presumably during Jubilee week — His Majesty observed a house, villa, or cottage that must have greatly taken his fancy, since we learn that he was seized with a desire to reproduce the design in his own country. With this object, it is reported, large shipments of English building materials are being made to Belgium.

Who is to be the architect of the new building is not stated. Perhaps His Majesty made inquiries as to who was the designer of the edifice he so much admired, with the result that he one day called in the neighbourhood of the Strand, Adelphi, Bedford-row, or Spring-gardens, and gladdened the heart of some London architect! Or, on the other hand, he may have commissioned his own architectural adviser to visit, and make sketches of, the fascinating house. Where is the building, I wonder? Can it be one of the fanciful mansions on the pleasant slopes of Camden-hill at Chislehurst; or is it some humble, moss-covered, oak-and-tile cottage of the Weald of Kent?

Touching mosses and lichens, I notice that the Aylesbury Dairy Company, Limited, advertise for sale some weather-stained slabs of Horsham stone, taken from old roofs. I fear that the company's customer will not be an architect, unless, indeed, such a one might be engaged in repairing a score or more of old roofs of a similar nature. The idea of putting these lichen-covered slabs on a new building is rather too much of a good thing. As regards the cost, never having purchased any of Nature's own colours, I cannot say whether the price asked—£300 for 30,000 superficial feet of golden russet and warm brown and orange—is reasonable or not.

Mem.: We might have more of this stone roofing attempted now than we see. It is true that when used for large roofs it is expensive, because of the extra strength required in roof-trusses and timbering; but it is a mistake, rather, to employ it in too wholesale a manner. A little bay or porch may be covered with stone slabs, even when the main roof is tiled, and the effect is often very charming. There is an example of such a treatment in a little house in Collingham-gardens, W., designed, I believe, by Mr. Ernest George.

There is to be published shortly an illustrated description of Long Melford Church — the elaborate flint-panelled Suffolk building. From an æsthetic point of view, as I have before observed, this church must be considered as hardly so good in external effect as the large amount of labour bestowed upon it would lead one to expect. Such excessive elaboration is not to be commended in modern imitations of the style. If I may be allowed to repeat what I have already said, I would say that "Little and good" should be the motto of the flint-panellist.

It is rather curious to reflect that the best age of "split and squared" flintwork in England was contemporary with the date of the general employment of flint-lock muskets. "Knapping" being then one of the arts of war, the adepts must have turned their attention to the arts of peace, and thus left, for our enjoyment and delight, such magnificent specimens of flint-cutting as are to be found in Norwich and Yarmouth, where we find buildings containing squared flintwork so beautifully executed that it is difficult to insert the point of a knife between the joints.

Mem.: In selecting flints for panel work, care should be taken to have as great a variety of tints as possible. Such appears to have been invariably the practice of the old builders in their happiest efforts. Choose flints from chalk and gravel, from seashore and inland districts, and avoid a preponderance of the heavy-looking black kind. Nothing looks so repelling and harsh as a uniform wall of dead-black flint-work, and, moreover, by using such flints sparingly you save money, as they are the hardest to split.

The *Citizen* says that Austin Garden, Austin Friars, E.C., is about to be closed, and a large block of offices erected on the site. The old monastery of Austin Friars, of which this garden is one of the last remnants, appears to have been a very fine work of architecture. The old structure was erected in 1354 by the successor of the founder of the institution, Humphrey Bohun, Earl of Hereford and Essex. In 1362 the elaborate spire was overthrown in a gale of wind. It was afterwards rebuilt, but in the course of time was pulled down, and the whole place fell into decay. For some centuries the church has been in the possession of the Dutch. Says the *Citizen*:—"The church remains in the hands of the Dutch, and now the garden is about to be covered by buildings, so the temple may soon be in the hands of the money-changers."

From the above it would appear that they have their troubles in the City as we have in the West. Whilst we are engaged in lamenting the possible desecration of St. Martin's-in-the Fields or St. Mary-le-Strand, our neighbours are fearing for the safety of their old churches. But, whereas our cry is mostly "Wolf!" the City people have often genuine cause for alarm that one of their few historical or Mediæval buildings may be swept away.

I observe that the lightning-riven spire of the Endell-street church has entirely disappeared, and an extensive scaffolding has risen in its place. With our modern fevered haste in building, however, it will probably not be long before another spire is grafted on to the old tower stump. It is *just* possible that the new spire will not be left without an ample lightning conductor with all the improvements suggested in recent discussions.

The Sanitary Institute having completed its labours in Congress, we ought to be considerably wiser than heretofore on health matters. Unfortunately the subjects discussed seem to have been rather diffuse. We scarcely need to learn from such a society how to lay out streets with regard to their appearance. It may perhaps be argued that sanitary science is so very wide-reaching that it is really all-embracing. But there is nothing like concentration nowadays when there is so much to be done on all hands; and it is probable that had the Institute confined itself to the discussion of, say, the Great Drainage Question and the relative value of the water-carriage, dry-earth, and filtration methods of disposing of sewage, it would have been of more practical assistance in increasing the sum of human happiness.

"Accidental death" and "Manslaughter." Such are the respective verdicts of the juries engaged upon the two great inquests. In the one case some hundred or more of persons were burnt, suffocated, or crushed to death; whilst in the other about twenty-five people were killed by the shock of railway collision. One "accident" happened through the attempt to obtain increased accommodation in a theatre gallery without providing a sufficient stairway or proper means of exit; the other mishap occurred through an oversight on the part of the driver of a locomotive, or his fireman. I congratulate the individuals concerned in the former disaster on their escape from all responsibility. And I sincerely hope that the driver of the ill-fated train and his fireman will be mercifully dealt with by the Judge whose duty it may be to try their case.

Goth.

The English Government has granted £500 towards the memorial to be erected in the new Brussels cemetery to the memory of the British officers and men who fell during the Waterloo campaign, on condition that the balance of the sum required be raised by public subscription. The design for the memorial by the Comte Jacques de Lalaing has been approved.

The French Stonehenge, Carnac, in Brittany, is to be purchased and preserved by the State. Most of it has been already purchased bit by bit, but the owners of the remainder having asked exorbitant terms, they are to be expropriated by the usual judicial valuation.

UR LITHOGRAPHIC ILLUSTRATIONS

AN EXHIBITION OF ARCHITECTURAL PHOTOGRAPHS.

)-DAY an exhibition opens at the Royal rchitectural Museum, Tufton-street, Westinster, of architectural photographs taken r the most part during the annual excursion the London Architectural Association last gust, by Mr. John L. Robinson, A.R.H.A., chitect, of Dublin, and we herewith produce ur of the series. The view of Great Chalfield nor is taken from the churchyard adjoining e front garden of the house. The gable to e fore part of the picture, with the beautiful micircular oriel bay window, has no buildings hind it. Our view (published August 19th th plans of the house) was taken from the ther side of the same front, and a reference ll enable the reader to realise very clearly w the gables and roof compose as a whole in mpany with the central structure which iginally formed the banqueting hall. eeple Aston Church, shown to the right to-day's lithographed "photo-tint," is imposing building, and the tower ds considerably to its importance. Mr. enry Clutton's new chancel no doubt is er-"spiked" with finials; but, nevertheless, is in scale with the church, and groups well th it in a general view. Photographs 21 and give the building from other points, and clude a general interior. We regret there is detail print of the figure wall corbels in the les; these, if crude, were eminently bold d telling. Modern carving generally fails the want of such qualities. In the north rch, which resembles the southern one, on a rble inscribed tablet over the doorway occurs unusual use of the Pauline injunction, b. xiii. v. 4, and is said to have been erected the admonition of a squire of former days the then rector. Lacock Abbey, as all dents of English architecture should know, a remarkable building—a mixture of nearly ry style, but devoid of all attempt at comition in its main outline—a mere medley of eral periods, and the result of none exactly particular. 61 shows the Jacobean tower the garden front, with its interesting details cially to lovers of what has been described the Free Classic style. The cloisters, which m three sides of a quadrangle in the centre the existing buildings, are herewith illustted, showing the florid and refined 15th-tury groining, with its numberless carved ses, most of which are coloured. The ernal treatment of the buttresses rising from tl weathering in a diagonally set pier and shing with the parapet, are eminently racteristic. Photo. 61 illustrates the quad. O last illustration shows a rear view of the George Inn, at Norton St. Philip, taken in the backyard, and giving the stair turret and cusped-headed original windows. A front view of the tavern appeared in our pages on August 19th last, with some notes on p. 280. In the exhibition of Mr. Robinson's photographs, other views appear, Nos. 4 and 5, the first of these being a most charming study, with an old waggon and horses in the foreground, making truly an artist's picture. Following now the order in which the prints are displayed, we note in Nos. 1 and 2 some good views of Bath Abbey, showing its oblong planned central tower, heavy angle turrets and lace-like open battlements. The peep over the river is an over-exposed plate—which is to be regretted, as Bath Abbey, whatever its faults in detail, groups strikingly well in the distance. No. 37, taken from the piazza of the grand Pump Room, is an exquisite view of the western façade. Wellow Church figures well in Nos. 7 and 8 of the large prints, the interior, illustrating the richly-carved beams of the nave roof, being particularly good. No. 44 is a view from the street, and the two following ones show the old house in the village where the party had tea, and saw the Jacobean panelling and chimney pieces, one of which is recorded in detail (46). Norton St. Philip Church and the Entrance Gateway to Corsham Court figure also on group No. 2. Corsham Church is admirably rendered, both inside and out, by quite a series of pictures, No. 9, giving Mr. G. E. Street's new tower and spire, being, perhaps, the best, and the Court House, the Mansion of Lord Methuen, furnishes a fine print, No. 12. Of the Hungerford almshouses, at Corsham, to which we already have directed attention, when giving a sketch of the roadside front in the BUILDING NEWS for Aug. 19th last, Mr. Robinson has prepared several "prospects," Nos. 54 to 59, including a luncheon group of the excursionists at the rear of the community hall. We consider the most successful and artistic photograph in the entire exhibition to be No. 19 giving the old bridge at Bradford-on-Avon. Nos. 17 and 18 are other views of the bridge, and the Saxon chapel comes out in No. 74, while the church in Nos. 75 and 76 is faithfully represented. The village scene in Steeple Aston round the Market Cross and lock-up house, with the gipsy carts and Methodist chapel behind the group, and the church tower in the distance, is an impromptu study of more than casual interest (No. 24). Cold Aston church figures on photo. 25, No. 26 giving the far-famed and rich wall pulpit from the same building. The delightful old Court House at the same place is well represented by the larger prints, 27 and 28, and No. 104 is a study of its entrance. St. Catherine's Manor well befits plate 29. The next group of photographs includes some valuable ones of Gloucester Cathedral, which Mr. Robinson took on his journey to Bath (Nos. 33, 34, 35, and 36), while group No. 9 represents others obtained after the excursion at Salisbury, Nos. 30, 31, and 32, with Lake House, near Salisbury, 111, and 105, 106, 107, and 108 giving other buildings in the city, with two views of Stonehenge, Nos. 112 and 113. Westwood Church, with its fine western tower and eastern chapel on the north side, is worthy of impressions Nos. 78, 79, and 80, and the great church of Winchester's Bishop at Edington is cleverly shown in photographs 85 to 91. "The discovery of the White Horse," at Westbury, "that phenomenon of Nature," as Mr. Robinson called it, is a character study on the Downs, showing how some people can disport themselves at the close of a hard day's work (No. 93). The tomb in Westbury Church and Hamswell Manor house, the home of Dick Whittington, the Lord Mayor, follow, and then come a good series from Marshfield, No. 85 to 103. The altar tomb to the "Saintly Murray," known as the "good," with his recumbent figure in fairly complete preservation, records to posterity an incident from the Marsh (No. 100). The almshouses and the "Catherine Wheel" are others from the same place. Nos. 114, the entrance to the Grand Pump Room Hotel, and 115, "The Adieux," also at Bath, conclude the series. The exhibition will close on October 7th, and is now open to the public free of charge.

ST. MARY-LE-STRAND, LONDON.

THIS well-known church is now under repair. The engraving reproduced illustrates the design as it left the hands of its architect, James Gibbs, the date assigned to the print by the authorities of the British Museum being 1717. It was probably published before the church was completed, because it shows the figure of Queen Anne over the portico, and the statues in the niches on the south front, neither of these details actually having been carried out, and omits the boundary railing, suggesting only a dwarf wall. The plate was issued possibly for the architect's patrons, and also for the use of the Commissioners, who built the church on land granted by Act of Parliament out of the coal and wine dues money, as one of the fifty churches then inaugurated in London. The plates in Gibbs's "Book of Architecture," published in 1727, a second edition of the same work appearing in 1739, are smaller than the view which we reproduce, and comprise six sheets, giving elevations and plans of the building, besides a general perspective view. This last is identical with that herewith, in so far as the fabric is concerned, but fresh figures are introduced, Jo. Harris in both cases being the engraver, though the other plates are the work of H. Hulfberg and E. Kirkall. Gibbs but very briefly describes this church, which he says was the first public building designed by him on his return from Italy in 1710, after a stay of ten years, and at which time he was 36 years of age. John Erskine, Earl of Mar, attracted by Gibbs's early promise when in Holland (during the years 1694 to 1700), gave him considerable favours, generously assisting the young Scotchman with money and recommendations, by which means he reached Rome, where the famous architect of the future studied under Garroli—a sculptor and architect of popularity and distinction. The time of the student's return was eminently propitious, and Lord Mar, as a favourite of the Queen and member of the Government, soon befriended him, by introducing the architect to the Commissioners already mentioned. King's College, Cambridge, was also one of his first undertakings, and St. Martin's-in-the-Fields speedily followed, the foundation-stone being laid in 1721. This church cost £32,000, and was built at the expense of the parish. The Commissioners, inspired by a desire to emulate the then known proposals of St. Martin's, spared no cost to beautify their neighbouring church of St. Mary's, and render the structure worthy of the prominent site granted by special Act for its erection. Gibbs made a more capacious design, with a square tower, and having a nave 67ft. long by 49ft. broad; but it was laid aside, he tells us, because its plan exceeded the dimensions of the ground allowed by Parliament. The present church has a nave 64ft. long by 38ft. wide, and beyond this is the apsidal-ended chancel. At first it was not intended to build a steeple to the church, "a small campanile or turret for a bell" being designed in its place over the west front. At a distance of 80ft. from this façade there was to have been a huge column 250ft. high (*i.e.*, 105ft. higher than the Nelson Column in Trafalgar Square) in honour of Queen Anne, and on the top of it was to be placed a statue of Her Majesty. Gibbs informs us that his design for this column had been approved by the Commissioners, and a great quantity of stone was brought to the place for laying the foundations; but the Queen died before the structure was advanced beyond this point, and flattery being no longer necessary the church had its steeple. When Gibbs received the order for this the walls of the church were 20ft. above the ground level. He found any alteration of the already too restricted plan of the church impossible from east to west, and so, in order to give bulk and importance to the elevation of his tower, he made it wider from north to south, which gives it an oblong plan with a measurement of only 14ft. from east to west. Had it not been for this incident the tower would have been square. "The church consists," writes Gibbs, "of two orders of architecture, in the upper of which the lights are placed; the wall of the lower, being solid to keep out the noises from the street, is adorned with niches." No statues, however, were placed in them, and a vase instead of the figure of the Queen crowns the circular porch at the western end. We are indebted for the loan of Harris's engraving to Mr. R. J. Withers, the architect who refitted the church and enlivened the interior with colour for the late Dr. Evans some ten years ago. Mr. Albert

Vickers is the architect now engaged in connection with the repair of the church, but no funds seem available for the purpose, and as yet there has not been a meeting of the parishioners to consider what is to be done. The Metropolitan Board of Works have obliged the churchwardens to dismantle the church. Mr. Wm. Butterfield and other authorities contend that it is not dangerous, but the architect in charge says that the building is seriously so. Tons of iron, it is affirmed, were built in the church by Gibbs, and, having rusted, the fabric is greatly shattered. The future alone can show what will be done with it.

VILLA AT WESTCOMBE PARK.

THE houses to which we give illustration to-day have, with several others, been recently erected on the above estate. They are built of red brick and Corsehill stone dressings up to the first floor, and above that are hung with Broseley tiles and rough cast. They are a marked improvement to the general run of houses on the estate. The grounds behind the houses fall 60ft. below the level of the road, and there is a good view across the river. They have been designed for Mr. Donnelly by Mr. E. Douglas-Hoyland, of 45, Fenchurch-street, and Mazehill, S.E.

LODGE AT FLETE, DEVON.

THIS drawing, from the Royal Academy Exhibition, represents a picturesque lodge, now in course of erection for Mr. H. B. Mildmay, in local walling stone and granite dressings, Mr. Pearse, of Modbury, being the builder, and Mr. John D. Sedding, F.R.I.B.A., the architect.

AN ENTRANCE GATEWAY AND BRIDGE.

THIS is a picturesque subject for architectural effect, and Mr. G. W. Ward, the architect, has not failed to seize the opportunity afforded him. His drawing was well hung in the Royal Academy Exhibition; but he has sent us no detailed particulars of his building by way of description.

A BOOK OF MEASURED DETAILS.

ONE of our lithographic illustrations to-day, representing some old mural tiles, is taken (by permission) from Mr. George Washington Browne's new book of architectural sketches, formed chiefly of the Pugin Studentship drawings with which he won that prize in 1878.* Though coming thus nearly ten years after the date of their award, Mr. Browne's drawings need no apology on this account, and many lovers of historical and architectural remains will be glad to obtain a copy of his very creditable studies and measured details. A goodly number of the subjects delineated in his volume are, as might be expected from an Edinburgh student, from Scotland, including St. Andrew's and Glasgow Cathedrals, Arbroath Abbey, with those of Melrose, Dryburgh, Dunfermline, Paisley, and Jedburgh, all of which abbeys are, more or less, represented; also a set of measured drawings is given of New Abbey, or Sweetheart, in Kirkcudbrightshire. The English specimens are varied by such as Ford's Hospital, Coventry, and Ockwells Manor at Bray, two familiar instances of half-timber work; Bishop Cantilupe's shrine at Hereford, from whence also are the Butcher's Hall and Aubrey's Almshouses; Salisbury, Shrewsbury, and Worcester are likewise represented, and the church of St. Mary, Felmersham, Beds, occupies several sheets with its pure and beautiful Early English architecture. The west front of this church is a singularly interesting composition, and the later rood screen with the loft over between the nave and the choir deserves notice for rich detail. The plates, of which there are 75, are folio in size, and all are well printed, the pencil studies being reproduced by the Litchdruck process, and the pen drawings by photo-lithography. From these remarks it will at once be gathered that Mr. Browne's collection is fairly well representative, and certainly the book deserves a place beside Mr. Galsworthy Davies's big volume of "Architectural Studies," the late Wm. Burges's truly practical folio of "Architectural Drawings," and the sketch-book of the Architectural Association. The sheet of encaustic tiles here reproduced includes examples from Tintern, Gloucester Cathedral, and St. Cross, near Winchester. These all have their designs executed in the common yellow on a red ground, and they are very varied in their patterns, which, for the most part, are spiritedly drawn. Passing over the ecclesiastical subjects, for lack of space to mention them at greater length now, we may in conclusion of this notice briefly refer to some of the drawings of Domestic work which enrich the pages of the book before us. Rowallan Castle, of which we recently gave some drawings (in the BUILDING NEWS for April 15, 1887), furnishes the first of these, giving a general sketch of the entrance, staircase, and towers, some details of a stone doorway in the courtyard, and a quaintly-framed old wooden door from the entrance hall, with shell panel above and moulded stiles and rails. In Mr. William Small's book on "Scottish Woodwork" similar joinery of this kind is represented, showing a type of detail in many respects peculiar to the North of the Tweed. Mr. Browne gives figured dimensions, which always enhance the value of a sketch, and his marginal sections are handy for reference. His drawings of the Porch at Benfleet, if we remember rightly, have appeared before in the A.A. Sketch-book. They are too mechanical to be artistic, and the same remark equally applies to the sheets of Ockwells Manor-house, near Bray, Berks, though the plan of the building is welcome, as also are the sections. The sketch of Grey Friars Hospital, Coventry, is truthful and spirited, drawn in pencil, like the studies of Falkland Palace, the ancient home of the Earls of Fife, with its great circular towers flanking the entrance to the courtyard. All that now remains is the south block, which seemingly was the work of either James III. or James IV. Glamis Castle is prettily sketched in plate 31, and is an eminently picturesque specimen of Scottish architecture. The scraps of wrought-iron work which figure on plate 42 give nothing very fresh or suggestive, but they serve to fill a sheet. Midmar Castle, Aberdeenshire, furnishes much that is of interest from an uncommonly quaint and massive building. Newark has been already mentioned. The front facing the river is a well-balanced composition replete with severity thoughtfully displayed. Paisley deserves a more thorough set of illustrations than are here given to it, but the church has been lately measured up by Mr. T. R. Kitswell, whose able drawings we hope before long to publish. Some old houses in the Abbey Precincts, Paisley, are typical specimens of Scotch work, and fill the following plate together with a Northumbrian stone house from Hexham. The Mediæval figure (taken apparently from Lonsdale and Tarver's book on "Costume") does not enhance the value of the elevations of the 15th-century house in Butcher's-row, Shrewsbury, drawn on plate 68, else the sheet is a model of neatness, while the details which follow are really useful "drafts." We can verify the accuracy of the sketch (75) of the Council Hall, Worcester; and with this illustration Mr. Browne's book closes, the subjects being topographically arranged. More studies like this of Domestic work less known to the ordinary student would have greatly added to the worth of this volume; while the plates devoted to Westminster Abbey, Salisbury, and other familiar works, already well illustrated, could easily have been spared to make room for such examples.

* Pugin Studentship Drawings. By GEO. WASHINGTON BROWNE, Architect. Edinburgh: David Douglas, 1887.

The schools attached to St. Mary's Roman Catholic Church, Formby, Lancashire, have recently been enlarged, and two additional classrooms have been built in the same style as the existing buildings. Crosby light pink bricks have been used for the general walling, with Edwards's Ruabon red and blue bricks in strings, arches, buttress, weatherings, &c. The interior is plastered throughout with a cemented dado. The roof principals are exposed, stained, and varnished. The work has been carried out by Mr. Edward Blackburn, builder, of King's-road, Bootle, from plans and under the superintendence of the architect, Mr. Frederick H. Peate, of Liverpool.

Works in connection with the sewering of Lymington were commenced on Monday, and are to be completed by June, 1888. They are being carried out for the town council from plans by Mr. James Lemon, M.I.C.E., of Southampton, at a cost of about £12,000. Mr. T. P. Hall, of Southsea, is the contractor.

COMPETITIONS.

KNARESBOROUGH. — The committee appointed to carry on the proposed improvements in the Castle yard and banks of Knaresborough have had seven designs and estimates of cost sent in, and recommended the adoption of one which it transpired was furnished by Mr. Hargreaves, of Abbey Plain, Knaresborough, and awarded him the first prize of £5. It has since been resolved to carry out the improvements as indicated on Mr. Hargreaves's plan, under his superintendence.

SCHOOLS OF ART.

LIVERPOOL.—The annual distribution of prizes and certificates gained last session by the students at the Liverpool Science and Art Classes took place on Friday evening in the Free Public Library. Mr. E. K. Muspratt, chairman of the classes, presided. The annual report stated that during the session teaching was conducted in evening classes in eleven schools in different parts of the city. In science there were 441 entries for study, 324 entries for the Government examinations, and 255 successes, the total percentage of successes being 78·7. In art there were 115 entries for study and 79 for examination. There were 34 successes, including 10 marked excellent, a decrease all round. The decrease in the number of students was due to the increase in the number of art schools in the city, and the decrease in successes was undoubtedly owing to the examinations being of a more stringent character than formerly. Mr. G. Fosbery Lister, engineer-in-chief to the Mersey Docks and Harbour Board, delivered an address, in which he dwelt on the importance and advantages of scientific education.

CHIPS.

There were 137 candidates for the appointment of borough surveyor for Tiverton, Devon, at a salary of £225 a year, with office, &c. Eight were invited to attend before the committee of selection and town council, and of these Mr. John Siddall, surveyor to the urban sanitary authority of Brownhills, Staffordshire, was appointed.

Long Melford Church, Suffolk, is the subject which will furnish a very complete monograph in illustration of Perpendicular architecture about to be published by Mr. E. Lauriston Conder, with an etching from the hand of Mr. J. D. Batten. There are to be 16 plates, the single-page sheets measuring 15in. by 10in., and all are photo-lithographed from the author's own pen-and-ink drawings. We have from time to time given illustrations of this well-known church, and shortly propose to give the new reredos lately erected under the direction of Mr. J. Medland, the architect, by Messrs. Farmer and Brindley.

Ystrad Jubilee Bridge, at Llanfair Caereinion, is now open for traffic. It is a substantial structure, and has been erected by Mr. James James, Cross-lane, under the supervision of Mr. W. N. Swetenham, county surveyor.

A fountain of Peterhead granite has just been completed by Messrs. John Fraser and Son, Aberdeen, to the order of Provost Donald, of Dunfermline, who has made a gift of it to that town. The fountain is square on plan, and stands on an octagon foundation of Aberdeen granite. There are four drinking basins, with smaller basins below. The upper part of finial consists of a bronze lion rampant, bearing in front a bronze shield with the Dunfermline arms. The entire height of the fountain is 17ft.

The Jubilee clock-tower at North Tawton, built from designs by Mr. R. Medley Fulford, F.S.A., of Exeter, was inaugurated on Friday. It stands in the centre of the town, opposite the Market, and is constructed of brick and stone. It rests on a granite foundation, and around the base there are seats, over which there is a tiled roof. Above is the clock-chamber, which has a steep tiled roof the whole surmounted by a vane and gilt crown. Mr. Ellis, of North Tawton, was the builder.

Memorial stones of new Primitive Methodist Sunday Schools at the rear of the chapel in George-street, Crewe, were laid on Monday week. The schools will accommodate 600 children, will be Gothic in style, and cost £2,000. Mr. T. M. Lockwood, of Chester, is the architect.

The free library at Newport, Mon., has just been enriched by the presentation of 1,000 volumes from the library of late Mr. J. Edward Lee, F.S.A. of Newport and Torquay, a well known archæologist. The gift comes from Mr. Lee's heir as a memorial.

Building Intelligence.

Bicton.—A new church at Bicton, near rewsbury, built from plans by Mr. Oswell, of latter town, at a cost of £3,400, was consecrated last week. The church is built to ommodate 250 persons, and is of the 14th-tury style. It consists of nave 54ft. by 21ft., th aisle 12ft. wide, and chancel 25ft. by t., vestry on north side of chancel 13ft. by t., and organ chamber, on south side, 14ft. 14ft. The building is altogether without stering, the walls inside being faced with d Hill stone in random courses, and relieved th dressings of Shelvoke stone, and the caps d shafts of the arcade are of Grinshill stone. nels in the east wall are formed of marble bs bearing the Lord's Prayer, the Ten Commndments, and the Creed. Messrs. J. and E. ad, of Plymouth, supplied the marble. Red d, stained and varnished, forms the seats of nave and aisle, the chancel stalls being of . The floor under the seats is of blocks of od in herring-bone pattern. Messrs. Carter, nson, and Co. supplied the encaustic tiles ich pave the floor of the chancel. At the th-east angle is a tower 75ft. high, with ner turret carrying a flagstaff. There are r bells—the one being from the old church, d two new ones, cast and hung by Messrs. n Warner and Sons, of Cripplegate. Messrs. es and Willis have carried out the lighting angements by brass hanging lamps and ckets, fitted with the Hesperus burners and inguishers. The lectern was made by Mr. omans, the foreman of the carpenters, and ssrs. J. and G. Groves, of Shrewsbury, were builders; Mr. H. L. Whittingham being rk of the works.

Birmingham.—The Highgate Branch of the mingham General Dispensary (the design which was selected in a limited competition) has been recently completed and opened the work of the charity. The materials d are red-pressed bricks, with Kenilworth ne dressings, and red tiles on the roofs. The lding consists of a large waiting-hall, with od block floor, to accommodate about 150 ients, with two consulting rooms, and dispensary in direct communication, an rating-room placed near by, and a resice for two doctors, with the usual outldings, &c. The waiting-hall is heated with h-pressure small-bore pipes by Mr. J. Jack, of Newcastle-under-Lyme, and ventilated the tower and ridge ventilators. The general tractors are Messrs. Horsley Brothers. The ole has been carried out from the designs under the direct superintendence of the hitects, Messrs. Dempster and Heaton, of svenor Chambers, Birmingham.

Dewsbury.—The eastern extension of the lish church will be reopened to-day (Friday), ring been completed by Messrs. J. and W. nland, of Bradford, from plans originally de by the late Mr. G. E. Street, and carried under the supervision of his son, Mr. A. E. eet, and Mr. A. H. Kirk, of Dewsbury, as ct architects. The extension, the cost of ich has been about £12,000, comprises ncel, north and south transepts, morning pel on the north of the chancel, organ mber on the south, clergy vestry, choristers' try, and porches. The nave, a structure uilt on 13th-century foundations in 1761, ains for the present untouched. The inor of the new chancel was illustrated in Building News for June 17th of the sent year from a drawing by Mr. A. E. eet, hung at the recent Academy Exhibition.

Glasgow.—At Friday's meeting of the sgow Dean of Guild Court, Lord Dean of ld Blackie submitted a summary of the r's transactions of the Court. During the lve months ending 31st August last the mber of linings granted was 238, being an ess of 38 beyond the previous year. The ess was wholly due to an increased number plicable to churches, halls, and schools, warcses, stores, &c., and to alterations and addics. Thirty-nine of the linings comprised 8 houses and 79 shops, as compared with 2 houses and 52 shops in the previous year. aggregate value of the property included he 238 linings was estimated at £424,730, as pared with £394,540 in the preceding year. On the other hand, dwelling-houses and shops had decreased from £208,050 in the preceding year to £174,450. Comparing the amount of business transacted in the Court five years ago, he said that in 1883 dwelling-houses figured to the amount of only £88,650, and had risen in 1887 to £174,450; warehouses, stores, and workshops, which in 1883 stood at £291,461, were in the past year registered at only £73,100. Churches, halls, and schools had during the same period risen from £35,500 to £63,200, and alterations and additions had decreased from £71,670 to £58,930. These figures did not seem to indicate any marked revival in the local building trades, but possibly, looking to the fact of the area of the municipality being a fixed quantity, and now presenting a comparatively limited space for the erection of new buildings, the figures he had quoted might be susceptible of a more encouraging interpretation than he had felt at liberty to put upon them. In the subsequent business before the Court, leave was granted to the governor of the Glasgow Technical College to erect new, and make alterations on existing, buildings in Cathedral and North Hanover streets.

Isleworth.—The Jubilee Hall proposed to be erected on the vacant piece of land at the back of the institute and public library in South-street, Isleworth, is to form an adjunct to the library. The ground floor is the institute proper, comprising large committee-room, to be also used for auctions, &c. (for which purpose a separate entrance has been provided), and smoking or games room communicating with the gentlemen's lavatory. Cloak-room accommodation for the separate sexes of both performers and audience are also provided on this floor. The public hall is situate on the first floor, and will seat about 400 persons, and is designed to serve the purpose of small theatrical entertainments as well as concerts, &c. The arched ribs, besides their important functions, are part of the roof construction, serve to break up the monotony of a plane ceiling, and also prevent an echo which generally results from plain boarded ceilings. The hall is to be warmed by means of Shorland's patent Manchester grates, which form the fireplaces for the rooms below, and also warm the fresh air before delivery into hall. The exits and entrances are all excellently placed, giving three independent exits, all opening independently to the streets, so that the building could be speedily vacated on a possible alarm of fire. The stairs are proposed to be of clean pitch-pine as being better adapted to withstand wear, and also safer in case of fire, than stone stairs. A fire hydrant is provided outside the building. The lowest tender was £2,353; but this amount being considered more than is likely to be subscribed at present, the committee are considering the advisability of reducing the cost. Mr. Stephen Woodbridge, jun., of 210, High-street, Brentford, is the architect for the new building.

Liverpool.—The Hahnemann Hospital in Hope-street, erected at the cost of Mr. H. Tate, was formally opened on Friday. Messrs. F. and G. Holme, of Crosshall-street, Liverpool, are the architects of the hospital, which cost £13,000, and accommodates 50 beds at present, but is capable of being enlarged on the south and west sides. The basement is arranged as a dispensary. The wards have a southern aspect. The male and female wards on the first and second floors are 69ft. by 24ft., and have each a convalescent room at the east end, with a bay window. A smaller ward is provided on the first floor, and two isolated infectious wards are on the second floor. There are also separation wards and five private wards, with convalescent rooms on the third floor. Service rooms are placed next the wards, and nurses' rooms, with inspection openings commanding all the beds. The latrines and bathrooms are cut off from wards by an air space and double doors; they have a separate system of warming and ventilation; are lined throughout with glazed tiles, and have polished cement floors. Nurses' bedrooms and dining-rooms, an operating room, and servants' bedrooms occupy the remainder of the upper floor. On the ground floor are the kitchens, sculleries, larders, stores, servants' hall, pantry, and service room. The boardroom, boys' room, and entrance hall are to the front. The house surgeon's rooms, matron's rooms, are located in the north wing. The exterior of the main front is faced with red Ruabon brick, with white stone from the Storeton quarries for dressings, and ridges, hips, and finials of terracotta. The soil drain pipes will be flushed out by means of a large self-flushing tank (Messrs. Doulton's, of London, patent) placed at a point where the soil pipes from closets join the drain. The ventilation and warming are arranged on the "self-acting suction power" principle. The contractors-in-chief are Messrs. Holme and Green, Benson-street, Liverpool. The other contractors included: American elevator, as patients' lift, the American Elevator Company, London; dinner and coal lifts, Messrs. Waygood and Co.; sanitary goods, Messrs. Doulton and Co., Soho-street, and London; terracotta, J. C. Edwards, Ruabon; ventilation, the Æolus Waterspray Company, London.—St. Mary's Church for the Blind, in Hardman-street, will be reopened on Sunday after redecoration. The first improvement which has been made is the new chancel. Formerly there was a three-light window occupied by one figure of the Saviour. This figure has been retained, and instead of the solid ceiling which covered in the sanctuary there are now three large panels of stained glass. The decorations include three zones, the first of which is a richly-coloured cornice, terminated by a course of white mouldings, which separate it from the middle, consisting of painted and panelled walls of deep gold colour and rich red—the gold-coloured panels being draped with floriated crosses and relieved with gold. Below this comes the final division, consisting of a dado of fine marbles, the dividing lines of which are of Turchino, a deep blue-grey marble coming from the Pyrenees. Between these grey boundaries are panels of Mexican onyx. The base of the dado is of Rosso variato, from Greece. In the centre of the chancel are three panels of Venetian mosaic on gold grounds, setting forth the Annunciation of the Virgin, and these are surrounded by a framework of Mexican onyx. The pavement of the chancel is fully in keeping with the other parts. On the right are sedilia of severely Classic form, and in alabaster slightly relieved with gold, and on the opposite side is an alabaster credence. The whole of these decorations have been carried out by Messrs. George Trollope and Sons, from the designs and under the superintendence of Mr. G. T. Robinson, their art director.

London, W.C.—A new residential college and school building at the Middlesex Hospital have been erected, having a front in Cleveland-street and at the rear of the hospital. The garden frontage, which forms the principal elevation, consists of a red brick building, six stories in height, and relieved by bay windows, constructed of buff-coloured terracotta. The style of architecture is an adaptation of Late Elizabethan, with Classic mouldings. The College will accommodate thirty students, each of whom has a separate apartment. In addition, there are on the ground floor a dining hall, a common reading room, and a study. The sanitary arrangements are all contained in a tower running the whole height of the building, separated from the main block by a passage freely ventilated on either side. Adjoining the College an addition has been made to the medical school buildings. The new building consists of four stories. In the basement are a large luncheon room and excellent lavatories; on the ground floor are students' reading room, lecture theatre, dean's room, and cloak room. On the first floor is the library, which occupies nearly the entire area of the building, and above this the upper floor is devoted to a laboratory and class room. The whole of these buildings have been erected by Messrs. Holland and Hannen, from designs prepared by Mr. Keith D. Young, architect to the hospital.

Moffat.—The new parish church of Moffat was opened on Friday last. It is in the Early English style, and is of red sandstone from Corncockle, near Lockerbie. It occupies a site to the south-east of the old church. The internal roof is waggon-shaped. The principal external feature is a western tower, about 22ft. square, rising to a height of 90ft., and having broad buttresses on each angle. The church is seated for about 1,150 persons. Behind the church are a hall, accommodating 350 persons, sessions house, and offices, and near by is a new manse, built in the Domestic Gothic style. The

works have been carried out from the plans of Mr. John Starforth, architect, Edinburgh. The total cost has been between £13,000 and £14,000.

CHIPS.

A Jubilee fountain in the churchyard of St. Giles's, Cripplegate, was unveiled last week. It is built to represent Old Cripplegate, and the materials employed are grey and red Aberdeen granite, with Kentish rag buttresses and a frontage of Portland stone. On the face of the fountain is a bronze medallion representation of Her Majesty, executed by Mr. Adams, of Chelsea. Messrs. Woodthorpe and Hammond, of Coleman-street-buildings, were the architects, and Messrs. Dove the builders.

A new organ built by Messrs. Brindley and Foster, of Sheffield, was inaugurated in South Leith parish church on Friday. It cost, with structural alterations to fabric, about £1,000, is built on the pneumatic tubular principle, and is contained in a pitch-pine case, with decorated pipes.

The Home Secretary has appointed Mr. D. Cubitt Nicholls and Mr. Shirley F. Murphy to hold an inquiry into the sanitary condition of Bethnal-green. The inquiry is the result of an appeal from the Mansion House Council on the dwellings of the people.

The large window in the south transept of Hereford Cathedral is about to be filled with stained glass as a memorial to the late Lord Saye and Sele, for many years archdeacon of Hereford.

A new bridge has been constructed on the main road near Holmsley Station, in the New Forest, in place of one destroyed by floods in December. The structure has been erected at a cost of £350 by the county. Mr. Pickthall, of Southampton, was the architect.

Extensive additions are about to be made at the General Post Office, Small-street, Bristol. The buildings, when completed, will be more than double the present area. The new front will be similar to the present one, but the dressings will be executed in Portland instead of Bath stone. The Board of Works have accepted the tender of Mr. A. J. Beaven, of Bedminster, although not the lowest by some £500 or £600. The work will be commenced immediately, and will take two years to complete.

A stately throne, designed for the nave, and presented to Lichfield Cathedral by the clergy of Derbyshire as a parting gift to the diocese and the Bishop on leaving his lordship's jurisdiction, has been formally handed over to the Dean and Chapter.

The Ministère des Beaux Arts has appropriated 100,000f. for the further restoration of the Church of St. Pierre at Caen, and the municipal authorities of Caen have also voted 108,000f. for the same purpose. Since the partial destruction of the Palais de Justice, Paris, in 1871, more than 80,000f. have been expended on works that conflagration rendered necessary at the Sainte Chapelle, adjoining the Palais. A grant of 50,000f., to be expended in 1888, will complete the work.

The restoration of the magnificent 15th-century reredos in Winchester Cathedral is making good progress from Mr. J. D. Sedding's plans. The repairs to the stonework in the central portion are now complete, but the vacant niches have yet to be filled with statues. The restoration of the north and south wings has just been commenced, Mr. Hodges being the mason and Mr. Whitley the carver intrusted with these sections of the work.

On Wednesday week Mr. J. T. Harrison, on behalf of the Local Government Board, conducted an inquiry at Wednesbury as to an application by the Corporation for permission to borrow £10,000 additional in respect of the sewerage undertaking, and £2,500 additional for the public park, raising the expenditure for the latter to £7,500, and that for the former to £45,000. It was understood that a favourable report would be forwarded to the Local Government Board.

Mrs. Gibbs, of Tyntesfield, who died on Thursday night, aged 68 years, was, with her late husband, the munificent founder of Keble College, its Chapel and Library, Oxford, erected from Mr. William Butterfield's designs in 1873-9, of a church and rectory at Exeter, built at a cost of £30,000, and of many other ornate buildings.

The town commissioners of Leek considered last week a letter received from Messrs. Sugden and Son, of that town, calling attention to the dangerous condition of the approaches to the large room at the town hall. The stage staircase was said to be worse than that from the gallery at Exeter Theatre, consisting of 31 steps in one continuous flight and without a landing. The commissioners have referred the letter to a committee.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

THE ASSOCIATION OF PUBLIC SANITARY INSPECTORS.—The members of the north-western district of this association, which covers Lancashire and Cheshire, and has its headquarters in Liverpool, paid a visit to Bolton on Saturday. The party, including representatives from Liverpool, Birkenhead, Wallasey, Wirral, Great Crosby, Blackpool, Swinton, Pendlebury, Hyde, Openshaw, Barton-upon-Irwell, and Newton Heath, drove to the School Hill Yard, where the disinfecting operations by means of Lyon's steam disinfector, were inspected. From here the company proceeded to the Burnden and Hacken Sewage Works, where Mr. J. Stewart, the superintendent, explained the *modus operandi* in detail. Next the Borough Hospital, for the treatment of infectious diseases, was visited, and subsequently the party drove to the Wellington yard depôt of the Corporation, a visit also being paid to the Healtheries Exhibition in connection with the Sanitary Congress.

CHIPS.

At the quarterly court of the Worshipful Company of Plumbers, Mr. F. Machin was elected Master, in succession to Alderman Stuart Knill. Mr. W. H. Bishop was elected Prime Warden, and Mr. C. Hudson, Renter Warden.

A pair of silver candlesticks have been placed on the altar at Salisbury Cathedral. Each candlestick is 32in. high, with a diameter at the base of 10in., and stands upon three lions. The lower part is moulded to one-fourth of the entire height, when it takes a hexagonal form, each face of the hexagon forming a canopied niche—the niches being filled with small figures of twelve angels bearing lettered scrolls. The shaft terminates in a corona ornamented with leaves and scroll work. The candlesticks have lengthy inscriptions in Latin, on the bases, and have been made by Messrs. Singer and Sons, of Frome, from designs approved by Mr. A. W. Blomfield, M.A. We illustrated them in our issue of the 12th ult.

On Saturday, the 24th inst., the foundation stone of a new Wesleyan chapel at Riggfoot, Tindal Spelter Works, Cumberland, were laid. The plan has been prepared by Mr. Wm. Marshall, architect, Naworth, Brampton. The building is 60ft. by 30ft., and has a vestry and entrance porch. It is Early English in character, and is built with stone from local quarries, and lined with bricks, and with cavity between. All the fittings are to be made of pitch pine, and accommodation made for 250. The total cost of the building is to be £500.

The wood block flooring at the Bradford General Post-Office, which we illustrated last week, was executed by Messrs. M. C. Duffy and Son, Limited.

Mr. H. Bassant, parquet floor manufacturer, has removed from Wells-mews, Oxford-street, to new and commodious premises at 89, Charlotte-street, Fitzroy-square, where, in the course of a few days, a show room will be open for the inspection by architects and others of all the latest designs in parquet and other flooring.

The Arts Committee of the Liverpool Corporation have selected and recommended for purchase for the permanent collection at the Walker Art Gallery the picture called "An Encore Too Much," painted by Francis Barraud, No. 1122 in the current Autumn Exhibition. The picture, which is of cabinet size, represents the greenroom of a circus tent, where a little acrobat has fainted through overtasking his strength in response to an encore. The clown, another performer, and a young girl attired for the arena, are trying to revive him.

The foundation stone of the Municipal Buildings at Sunderland was laid yesterday (Thursday). The buildings are being erected in Fawcett-street from designs by Mr. Brightwen Binyon, F.S.A., of Ipswich, selected in competition.

The rebuilding of the London and North Western Company's station at Dewsbury has been commenced this week. The contract has been taken at about £20,000 by Mr. Nowell, builder, of Preston.

Mr. George Cunliffe, architect, of Bolton, died on Sunday at his residence, Arnside, near Bolton, at the age of 51 years. The deceased gentleman, who had retired from his profession for about six years through paralysis, was the designer of some important buildings in Bolton, including Mawdsley-street Chapel, Trinity Church Schools, the Mechanics' Institute, Manchester and Salford Branch Bank, Victoria Chapel, and numerous mills and residences.

A row of almshouses are about to be built at Arundel from designs by Mr. E. Watkins, of New Bridge-street, E.C.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions our correspondents. All communications should drawn up as briefly as possible, as there are ma claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and communications respecting illustrations or literary matt should be addressed to the EDITOR of the BUILDI NEWS, 332, STRAND, W.C., and not to members of t staff by name. Delay is not unfrequently otherwi caused. All Drawings and other communications sent at contributors' risks, and the Editor will n undertake to pay for, or be liable for, unsought contrib tions.

Cheques and Post-office Orders to be made payable J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of t United Kingdom; for Canada, Nova Scotia, and the Unit States, £1 8s. 8d. (or 7dols. 30c. gold). To France Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindis £1 17s. 4d. To any of the Australian Colonies or Ne Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertis ments, Public Companies, and all official advertisemen is 1s. per line of Eight words, the first line counting two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneo and Trade Advertisements (except Situation advertis ments) is 6d. per line of eight words (the first li counting as two), the minimum charge being 4s. 6d. f 40 words. Special terms for series of more than s insertions can be ascertained on application to the Pu lisher.

Front Page Advertisements 2s. per line, and Paragra Advertisements 1s. per line. No front page or paragra Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant or "Situations Wanted" is ONE SHILLING for TWENT FOUR WORDS, and Sixpence for every eight words aft *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach t office not later than 3 p.m. on Thursday. Front pa advertisements and alterations in serial advertisemen must reach the office by Tuesday Morning to secure ins tion.

NOTICE.

Bound volumes should be ordered early (price Twel Shillings each), as only a limited number are do up. A few bound volumes of Vols. XXXIX., X XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLI L., and LI. may still be had, price Twelve Shillings; the other bound volumes are out of print. Most of t back numbers of former volumes are, however, to had singly. Subscribers requiring any back numbe to complete volume just ended should order at once, many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. eac Reading cases 2s. each.

LEARNER, Bengal. (We have sent your communicatio *re* Campin's "Materials and Construction," to M Campin, and he writes:—"I am sorry your corr spondent has been troubled by the typographical ina curacies in my work. I was under the impressi that all these had been corrected in the seco edition. In the example cited, $M = 2M'' = \frac{s.b.}{6}$ $= \frac{4 \times 11 \times 8 \times 8}{6} = 469$in.-tons. The area of triang $a\,o\,c = \frac{s.d}{4}$; its mean leverage about the neutral ax $= \frac{2}{3}\left(\frac{d}{2}\right) = \frac{d}{3}$; then the strength varying directly the breadth (b) the moment of resistance of half t beam $= b \times \frac{s\,d}{4} \times \frac{d}{3} = \frac{s.b.d^3}{12}$; and of the whole bea the moment of resistance is equal to twice this, $\frac{s\,b\,d^2}{6}$. There is no need to reproduce the figure, as yo correspondent has it in my book. I hope your corr spondent will not be perplexed with further errors.")

Correspondence.

THE A.A. DECORATION AND ORNAMEN CLASS.

To the Editor of the BUILDING NEWS.

SIR,—Will you kindly allow us to call atte tion through your journal to the *elementa* class for the study of decoration and ornamen which will be commenced this session und the guidance of Mr. Cole A. Adams? The fir meeting will be held at No. 9, Conduit-stree on Thursday, October 13, at 6.30 p.m., wh the course of study to be pursued will be e plained. Students wishing to join should se in their names at once to the secretary, M Walter H. Hewish, 14, Holden-terrace, Gro venor Gardens, S.W. The fees and rules w

similar to the other elementary classes.—
e are, &c.,
THOS. EDWARD PRYCE }
FREDERIC R. FARROW } Hon. Secs.
Architectural Association, 9, Conduit-street,

[The response ought to be a hearty one. No
tter teacher could be found, and students
ould not miss the opportunity.—ED. "B.N."]

ATER CONSUMERS TAKE NOTICE!

SIR,—Will you kindly oblige this council by
ving publicity, through your widely-read
lumns, to the fact that during the recent
ssion one very useful little Bill has been
ccessfully pushed through the needful
rliamentary forms and became an Act in
ly last? It is entitled, "An Act to limit the
wers of the water companies to cut off the
nants' water supply where the rate is paid by
e landlord." The Bill was introduced by Mr.
rrest Fulton, and to that gentleman great
edit is due for the tact and perseverance with
hich it was pressed through the various stages.
ie practical effect of this piece of legislation,
hich cannot be too widely made known, is
at it restrains the water companies from
tting off any water supply where the owner
d not the occupier is liable for the rate, and
here a dispute may have arisen as to the pay-
ent of the rate. It further enforces a penalty
£5 per day upon any company until such
pplies shall have been restored.
While writing permit me to add that, in view
the serious scarlet-fever epidemic, the council
ve prepared a small leaflet to parents as to
at to do when children are first attacked.
ese leaflets, by the kind permission of the
airman of the School Board, we are circu-
ing throughout the metropolis. Anyone
shing to have copies may have them free by
iting to this office.—I am, &c.,
JOHN HAMER, Hon. sec.
ie Mansion House Council on the Dwellings
of the People, 31, Imperial-buildings, Lud-
gate-circus, E.C., Sept. 28.

MASONS' FOREMEN.

SIR,—"Banker Hand's" letter in this week's
ue opens an interesting and, so far as I am
are of up to now, the quite unanswered
estion—How is it that builders' foremen are
rly always carpenters and joiners by trade?
It is quite the exception to the rule to find a
neral foreman who is by trade a mason.
iting with some experience as a general
eman (it so happens that by trade I am
ther a mason nor carpenter, so I speak with-
t prejudice), I endorse the well-known
tement that nearly all the best foremen in
e country were brought up at the bench.
I certainly cannot agree with "Banker
nd's" remark that, in an ordinary mason's
p there are always one or two men capable
discharging a foreman's duty. Quite on
e contrary, my experience is that the average
intelligence amongst banker-masons is ex-
dingly low in comparison to that of joiners,
d that where one joiner in twenty perhaps is
pable of setting out a mason's job for him,
re is not one mason in five hundred suffi-
ntly well-informed to give a carpenter prac-
tal instructions about his particular work.
Further, there are few masons who can set
a plain bit of tracery even; until his job is
rked out for him, a working mason is as
lpless as a child.
The incapability to grasp a job from begin-
ng to end, so lamentably general amongst
rkers in stone, has certainly no parallel
aongst joiners, and hence I conclude, as I
gan, by asking, How is it that, although
asons and joiners work side by side, the latter
ssess so much more intelligence than the
rmer?—I am, &c., GENERAL FOREMAN.

EXETER THEATRE FIRE.

IR,—I feel it necessary to reiterate briefly,
t if a theatre, concert hall, or any structure
is required to be made really fireproof, and if
th additional reasonable cost and the time is
allowed, all of a theatre, except, perhaps, the
stage—of which I will not be so sure, as I have
not been behind the scenes to know the re-
quirements—but the roof, all permanent floor-
ing, ceilings, staircases, dadoes, partitions, doors,
window frames, columns, girders, arches, &c.,
can and should be made fireproof, the iron
being protected by incombustible materials
where necessary. But to do all this effectually
requires more time than is generally allowed,
for such work cannot be rushed up, as such
buildings usually are, so it seems to resolve
itself to this: lack of time and money have pre-
vented the architects and builders doing their
duties so well; and this the public should
know, and relieve the former from some of the
blame cast upon them.
I consider stud lath and plaster walls or
partitions should not be used in any building
to be fireproof, and avoided much as possible
in all permanent structures for there being
but little connection or tie to the walls, in a
fire they become dangerous and leave a mere
shell of outer walls; whilst, if a brick-thick
wall, or half-brick only, on an iron girder, if
need be, properly protected from action of fire,
and iron hoop bond in the wall properly
hooked, it ties all well together, for it is well-
known, by firemen especially, many lives are
lost through walls falling into the street,
which can in future be prevented if required.
Notwithstanding much that has been urged
of late, I saw about a score bundles of laths in
the entrance hall of a theatre where work
was going on in England, and since the terrible
Opera Comique fire took place in Paris, which
alone should be a caution against using fir lath
on wood studs and ceiling joists, or at all
whilst there are iron laths. I have read of a
new American sheathing substitute, I suppose of
iron.—I am, &c.,
Broxbourne, Sept. 28. JAS. PULHAM.

FIRE!

SIR,—The utter destruction of buildings by
fire is so common, in spite of energetic effort
and best appliances, that we are in danger of
an optimist persuasion that the evil is irreme-
diable and cease attempting anything further.
But it seems to me there are clearly one or two
directions in which experiment should be made.
In the first place, to greatly increase the
volume and power of the water discharged.
The present small nozzle to hose is utterly in-
effective. The thin stream of water flowing
therefrom "playing" (rightly so-called) on the
devouring element has no power to strike the
surfaces ignited, for it is at once evaporated by
the great heat, and possibly decomposed, so that
its oxygen feeds the flames. It strikes me that
the stream should be (to be useful) four times
as great, and that the nozzle, hose, and engines
must be increased in size proportionately; of
course, there would be more difficulty in
managing such, but this must be got over.
Manifestly, there is no use in going on as now;
every day we see the utter inefficiency of the
means at present used. The fire is never "got
under" until it has "burnt itself out."
Another and even more important improve-
ment it seems to me would be to stifle the fire at
its first outbreak by using in solution anti-
igneous salts. I would propose to carry on the
engine, or in an attendant cart, a strong solu-
tion of common salt or soda—tungstate of soda,
perhaps—to mix with the water used. A dis-
charge of this for a few minutes might prove
fully effective, and for one pound thus spent
five hundred be saved. Such things would be
worthy of trial; something surely can be done.
—I am, &c., M.

SHORT LENGTHS OF PAPERHANGINGS.

SIR,—Some time ago I had some rooms
papered. The walls were measured and an
order for the quantity required sent to a maker.
As it did not cover the walls, I was certain that
there were not a dozen yards to the piece, and
wrote to that effect to the maker. I give his
reply as copied from his letter. I always under-
stood that paper was sold by pieces of a dozen
yards each, and I ordered accordingly, as
probably most people would do.
"SIR,—I notice your remarks about the pieces
of flocks not being 12 yards long. There is not
a maker in the three kingdoms who makes
paperhangings 12 yards. I have been in the
trade 18 years, and from that time to now have
never bought one piece 12 yards, and during
the 18 years I have not measured more than
four pieces. For this reason I do not sell them
by the dozen, but by the piece, and each piece
measures 11¼ yards. American lengths are
only eight yards; French lengths are also eight
yards.—Yours truly, ——."
Is this the usual custom in the trade?—I
am, &c., A HOUSEKEEPER.
Manchester, Sept. 26th.

CHIPS.

A system of sea-water supply for road-watering purposes has lately been completed by the Littlehampton local board, at a cost of about £850 from plans prepared by their surveyor, Mr. H. Howard. The contractor for the works was Mr. W. H. Dearle, of Chichester.

The foundation stones of the new Wesleyan chapel at Farndon, near Newark-upon-Trent, were laid on the 15th inst. The building, which will be of red brick, with terra-cotta facings, will accommodate 150 worshippers. The style will be Queen Anne modernised, and the chapel will cost about £300. Mr. Basil E. Baily, of Newark-upon-Trent, is the architect, and Mr. Crossland, of the same town, is the contractor.

A new lodge is about to be built at the entrance to the Bury St. Edmunds Grammar School for the governors. Mr. Frank Whitmore, of Chelmsford, is the architect.

The committee of the Greenock Police Board appointed on officials' salaries have recommended that the salary of the master of works be reduced £100 per annum; that of his assistant £30; and the assessor in the Dean of Guild Court by £55 per annum.

Sir W. Vernon Guise, Bart., who died on Saturday at the age of 71, was one of the first supporters and afterwards served as president and permanent vice-president of the Bristol and Gloucester Archæological Society, and took an active interest in antiquarian and geological pursuits.

A new organ was used for the first time at Tewkesbury Abbey on Monday at the choir festival. The instrument has been recently removed from the Liverpool Exhibition, and presented to the Abbey by the Rev. C. W. Grove, of Tewkesbury. It is termed the "Model Organ," and is an attempt to place in the hands of the player a grand and complete organ reduced to the smallest possible dimensions as regards the number of its slides.

The completion of the western towers of the new nave of Bristol Cathedral will be celebrated in March next by special services for which arrangements are being made. It will mark the realisation of Mr. G. E. Street's entire scheme.

An inquiry was held on Tuesday week at Shoreham, Kent, by Mr. Arnold Taylor, in reference to an application by the Sevenoaks Rural Sanitary Authority for sanction to borrow £1,200 for sewage works in that village.

During the present week M. de Hérédia, Minister of Public Works in France, has been busily occupied, in company with M. Lux, Director-General of the Railways of France; M. Guillain, Director-General of Harbours, Mines, Canals, and Roads, and other officials, in inspecting various engineering works in this country. The programme for the first day, Tuesday, comprised visits to the Metropolitan and District Railways, the Royal Albert Docks, and the Tilbury Docks. On Wednesday they visited the Mersey Tunnel and Liverpool Docks, and in the afternoon proceeded to Edinburgh. They will remain in Scotland till Sunday, visiting the principal docks and harbours at Leith, Glasgow, Greenock, and elsewhere, and return to London on Thursday in next week.

A technical lending and reference library will be opened at Carpenter's Hall, London Wall, on Monday next.

The death is announced from Cheltenham, at the age of 62 years, of the Rev. W. S. Symonds, of Pendock, a well-known archæologist and geologist. He had frequently contributed papers on geological subjects to the British Association, and was the author of many topographical works relating to the district of the Malverns.

Professor Schliemann has received permission from the Greek Government to search for antiquities on the Isle of Kyrita.

Earl Percy laid the dedication stone of the new church of St. John the Baptist at Lower Caversham, near Reading, on Saturday last.

Her Majesty has granted a civil list pension of £130 per annum to Sir John Steell, R.S.A., in recognition of his eminence as a sculptor.

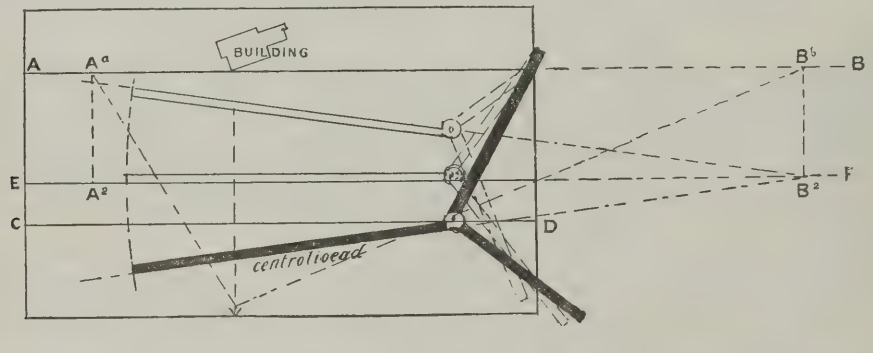
The new Macfarlane Museum, at Bridge-of-Allan, was formally opened on Monday. The building is in the Early French Gothic style of the 13th century. The large hall is about 90ft. by 50ft., with a gallery round three sides. Off this hall is a room, about 40ft. by 30ft., divided from the hall by an arcade.

Intercommunication.

QUESTIONS.

[9413.]—**Concrete Floors.** — Can anyone kindly inform me what thickness of cement concrete, and what foundation would be required for it, to carry rully traffic three tons each ?—ENQUIRER.

[9414.]—**Bird's-eye Perspective.** — Would any reader kindly give full instructions for drawing bird's-eye view perspectives ? Am at home with other perspectives. —TOPSMAN.



[9415.]—**Mun. and San. Engineers' Exam.**— I should be glad if any reader will oblige me with a list of the best books for passing the above examination.— ÆOLUS.

[9416.]—**Steam Ovens.** — I have surplus steam power, in a large establishment. How can I employ it for bread-baking in existing ovens? It is required to do away with as many separate fires as possible.— F. G. E.

[9417.] — **Book-Keeping.** — Would some reader kindly say whether there is a good work published on book-keeping for builders ? If so, by whom ? I understand that the one by Bevis, reviewed in the "B. N." a few years since, is out of print.—BUILDER.

REPLIES.

[9390.]—**Perspective.** — There is a complicated method of setting the centrolinead in several books on the subject, but "C. H. F." will find the following method very easy. After you have fixed your paper on your board, and your plan above, draw your picture plane line A B. Then from your point of sight V draw the lines V B^b and V A^a parallel to the two sides of the building which you wish to show in your picture. Then draw your line C D as your picture line below, and another line 5′ 6″ or thereby above it as the eye-line E F. Drop the points A^a and B^b down to this line E F, as shown by

dotted line. Draw two lines from the point thus obtained on the side you wish to use the centrolinead (as one side will fall on your drawing-board, and you can use a common straight-edge), one above the eye-line and another below. You then set your centrolinead to work on these two lines ; also, it should work to the eye-line. The way is as follows :—After putting the studs (two large pins or needles will do as well) in your board, about the place they are shown in the sketch, you work up and down the centrolinead against them ; set it to one of the lines you have drawn from the vanishing-point by unscrewing the screws and shifting the back legs, then screw them tight again, and work your centrolinead down to the bottom line, pressing firmly against the studs, and see if it will work to the other line. If it does not, you must unscrew the back legs and widen them, or draw them in as you think proper, and try again till you get it to work to the three lines. If it works to the top and bottom one, it is bound to work to the centre one. The use of the centrolinead is when the point B^b or A^a is out of the drawing board ; then the two lines you draw from point B^2 to set your centrolinead to, have to be done carefully with a thread or string, also the line V . B^b can be obtained by fixing a thread to a pin at point V and another at A, running along A B ; hold the other parallel to the side of your building, then where you make the two meet is the point B^b ; next measure the distance from your board to B^b. The same distance will be required to find the point B^2 from the board below. You may get your centrolinead to set in a few seconds, or it may be an hour.—LUX.

[9399, 9401, and 9407.]—**Quantities, &c.**—These three questions are more or less connected, particularly the first and last. As to the first, I have not read Prof. Kerr's paper, for, from what I did read some time ago about the profession and quantities, and quantity surveyors and their accounts, and architect's accounts, I formed the opinion that he was not a good authority on the subject, and rather expected that the R.I.B.A. would read him a lecture than that he would read a paper before that body on the subject unless it was more personal than general. "Surveyor" asks—"Why do many architects object to the quantities forming the basis of the contract" ? To which I reply, Because clients wish to know at least approximately what they have to pay, and don't wish to pay for a general measurement at the completion of the work in addition to the quantities. He also asks, Why is it asserted that "if the quantities form part of the contract, the quantity surveyor is absolved from all liability from errors"—which no one asserts that understands the matter, for, of course, he would be liable to whoever paid him and was injured by his negligence or incompetence ; but practically he would not be liable, for the client would not easily discover the error, and if he did, could not prove loss in paying for work done. There is no doubt that the surveyor is liable to the contractor, if he pays him for the quantities, for any loss from his negligence or incompetency in preparing them ; but is it not generally as "Surveyor" assumes, the builder says nothing about it.—G. H. G.

[9400.]—**Acoustics.**—Try the effect of copper wire stretched across the church above the pulpit, a foot or two higher than the preacher's head. A sounding board may be found better.—G. H. G.

[9401.]—**An Architect in a Fix.**—"A. B. C.'s" position will depend on the agreement whether he was to build one or two pairs. There is nothing to prevent a client building the second pair of houses like the first without employing the architect—that is to say, if there is no special agreement between them.—G. H. G.

[9403.]—**Half-Timbered Work.**—Keene's cement makes a good finishing coat, also smooth for painting on ; or Portland and sand mixed is often used.—T. HUDSON.

[9404.]—**Royal Engineers Department Exam.** —I should recommend Tarn's "Science of Building," Rivington's "Building Construction," Seddon's "Builder's Work" (Rivington), Hurst's "Handbook" (Spon), and Laxton's "Pric -book."—G. H. G.

[9406.]—**Painting Hot-Water Pipes.**—Wolston's Torbay purple-brown iron paint would stand well on hot-water pipes exposed to view ; but be careful to see that the paint is supplied by original manufacturers, as adulterated imitations are made.—ARCHITECT.

[9407.] — **Specification not Agreeing with Quantities.**—The contractor can be asked to perform work described in the specification though not in the quantities.—ARCHITECT.

[9408.]—**Architectural Perspectives.**—If the curves cannot be sketched in by hand, the French curves may be used. I am not aware that draughtsmen use jagged or indented straight-edges for the sake of picturesque effect. It is much better to effect these irregularities by hand. In drawing arches in perspective, if they are large, points in the curve may be found by drawing the enclosing rectangles in perspective, and lines drawn from the centres to the angles will intersect parallel lines drawn to the points of distance, giving points on the curves.—G. H. G.

[9408.]—**Architectural Perspectives.**—In drawing arches, curves, &c., it is more usual to use a compass than French curves, which I think "Learner" will find are not much employed (as a rule) in architectural work, the only difficulty being to find the centres required. The rough jagged lines he will find are done by hand and not by an indented straight-edge. This method, of course, requires practice, as "Learner" will see.—T. HUDSON.

[9409.]—**Warehouses.**—Shops with dwelling-rooms come within the dwelling-house class. The "warehouse class comprises all warehouses, manufactories, breweries, and distilleries," but it is doubtful whether strictly a shop may not be included under the warehouse class. One magistrate ruled that it was difficult to draw the line. Many shops are warehouses also. Mansard roof with pitch of over 47° is clearly not allowed under Sect. XI 2 of the Act, where it distinctly says that "the plane the surface of the roof of a warehouse or other buildin used either wholly or in part for purposes of trade, sh not incline from the external or party walls at a great angle than 47 degrees with the horizon."—G. H. G.

[9412.]—**Eyesight.**—In reply to "Vedra's" questi in last week's BUILDING NEWS *re* the above, I wou advise him, when working by an artificial light, to have placed well behind him, so that the rays from the lamp whatever it may be shall be thrown off the paper he us away from him. In the usual way the light is placed front of the worker, thus causing the rays to be throw off the paper full into his eyes, this being the reason much strain to his eyes. A good oil-lamp I find is mu preferable to gas. Do not take to spectacles without t advice of a thoroughly good oculist, for though this m cost rather more in the outset, it is by far the most ine pensive method in the long run. I have suffered fro defective sight for the past six years now, and had I on consulted an oculist of good standing in the first plac should have saved myself considerable trouble and e pense. Last year I was in London, and consulted L Lang, of Wimpole-street, when I was advised that t only thing to be done was to stop work directly I felt a strain, and also to have my gas or lamp behind me wh at work at night. Of course, he prescribed glasses, but am glad to say I rarely have occasion to use them no my sight being so much better. A green shade over t eyes is perfectly useless, as it does not protect the ey from the light at all. I may add I always take eve opportunity to bathe my eyes with clear cold water. If can give any further advice suggested by my own expe ence to "Vedra," either through these columns, or to hi through the post, I shall only be too happy to do so. J. H. W.

CHIPS.

A very large clock has just been erected up the church tower of Sileby, Leicestershire, John Smith and Sons, Midland Clock Worl Derby, which strikes upon a 21cwt. bell, plays t Westminster quarters upon four bells, and sho time upon two dials, each 6ft. across. The mov ment is fitted with all the latest improvemen and designed generally after the lines laid down Lord Grimthorpe. The same firm have also j completed a large clock at Kingsbury Chur Somerset, which shows time on two 6ft. dials.

The Dewsbury School Board accepted on Tu day the tender of Messrs. Chadwick and So Staincliffe, who are at present building the to hall at Dewsbury, for the masonry, joinery, a ironwork in connection with the Queen Victo Jubilee Schools, which are to be erected on the s of the George and Dragon, Town End, Dewsbu at a cost of £6,000, exclusive of the land. O thirty firms tendered for the work. Mr. J. L. F of Dewsbury, is the architect.

The foundation-stone of a new Baptist cha was laid in Fore-street, Teignmouth on Tuesd The chapel will be Gothic in style, of red bri with Bath-stone dressings, and will measure 75 by 27ft. There will be two galleries, and seati accommodation will be provided for about 3 persons. The buiding is to be erected from the signs of Messrs. J. W. Rowell and Sons, of Newt Abbot, and the builder is Mr. C. Francis, wh contract price is £710.

The 17th-century rood screen in Plymsto Church was unveiled on Wednesday, after resto tion by Mr. Harry Hems, under the supervision Mr. R. Medley Fulford, A.R.I.B.A., of Exet All the missing portions, doors, mullions, uprigh have been made good in English oak ; the structu has been raised upon a solid block of oak, runni the entire width of the church. Every piece of t old carving, cresting, &c., has been replaced, whil the new work has been made to harmonise with t old by staining the new oak to a dark hue.

During the recent visit of inspection to Devo port Dockyard and the neighbouring establis ments and forts, the Lords of the Admiral accompanied by Colonel Percy Smith (director works), Mr. Fishendon (superintendent ci engineer), and Mr. Richardson (clerk of work inspected the new gun drill battery on the top Longroom Hill. Mr. Jonathan Marshall, the oc tractor, met the party. On the completion of the n battery, which will cost about £4,000, the existi battery will be utilised as a drill and lecture roo From this lecture room a flight of steps will lead to the building, which is of pitch-pine ; it is abo 160ft. by 40ft. A conning tower rises in the cen of the roof.

Plans are being prepared by Dr. Rowand And son, of Edinburgh, for a building to house panorama representing "The Battle of Bannoc burn," about to be erected in Sauchiehall-stre Glasgow.

An inquiry was held at Tonbridge on Wedn day week before Mr. Arnold Taylor, an inspec from the Local Government Board, with referen to an application from the urban authority sanction to borrow £7,500 for widening approaches to the Great Bridge, now being rebu by the county magistrates from plans by Mr. Ru at a cost of £3,000.

Our Office Table.

THE forty-sixth session of the Architectural ssociation will be opened on Friday evening in xt week with a *conversazione*, to be held at the estminster Town Hall. Following the pre-dent of last year there will be no prize dis-ibution nor presidential address, but drawings ecuted by the travelling students and in the rious classes will be exhibited in the suite of oms on the first floor. A military band will ay at intervals in the large hall, and two ncerts will be given in the council chamber. ie programme for the session is as follows :— iday, Oct. 21, address from the president, hn Slater, B.A.; Nov. 4, "Architectural odelling," J. C. L. Sparkes; Nov. 18, "Per-ective Drawing and the Apparent Form of ojects," F. T. Baggallay; Dec. 2, "Our retching Club Scheme," H. D. Appleton; Dec. , a Paper by T. G. Jackson, M.A., F.S.A.; n. 2, 1888, "Hydraulics for Architects," Prof. . Cawthorne Unwin; Jan. 20, "The Use d Abuse of Materials," Somers Clarke, F.S.A.; b. 3, "Mahomedan Architecture," R. Phené iers, F.S.A.; Feb. 17, "A Botanical Con-ibution to Architecture," W. H. Bidlake; arch 2, "Old House Work," F. M. Simpson; arch 16, "Brasses," A. Oliver; April "Members' Soirée," April 20, "Greek uildings," F. R. Farrow; May 4, "Cornices d String Courses," H. H. Statham; May 18, A Travelling Student's Notes in Belgium," H. Hart.

UNDER the suggestive title of "Education, ultivation, and Examination," Professor T. ger Smith, F.R.I.B.A., will deliver a public troductory lecture in connection with his sses of architecture and construction at niversity College, Gower-street, W.C., on ednesday evening next at 7.30 p.m. The cture will, of course, be treated mainly as bears on the subject of architecture; will be illustrated, and the attendance intending students and their friends is in-ted. Professor Smith's classes this year will divided into three separate courses, each nsisting of thirty lectures—A, treating upon rchitecture as a Fine Art," will begin tober 11; B, "Architecture as a Science," October 12; and C, "The Modern Practice Architecture," intended to meet the require-nts of the Institute examination, on tober 13. Among the classes on allied bjects at University College are those on rchæology, given by Professor Sir C. T. New-n, of which the first term, commencing on tober 7, will deal with Greek inscriptions, d the second with Greek myths as repre-nted in vase paintings and other works of art; Hygiene, by Professor Corfield; on the trength of Materials, by Professor Kennedy; hose on Chemistry in relation to Engineering d Architecture, by Professor Graham; and hose on Land Surveying and Levelling, by Professor Vernon Harcourt.

THE foundation stone of the new Engineering ollege in connection with Liverpool University ollege, will be laid to-morrow (Saturday) by arl Derby. The new college is being built at the cost of Sir A. B. Walker on the Brown-ow-hill side of the existing buildings, from ans by Mr. Alfred Waterhouse, R.A. In the ening the prizes gained last session in the ollege will be distributed by Lord Derby, and a address will afterwards be given by the rofessor of engineering, Mr. H. S. Hele Shaw, M.Inst.C.E. A course of twenty lectures is to given at the University by Professor Conway, A., on "The History, Arts, and Antiquities of Phœnicia and its Dependencies."

THE Art Gallery formed last year by the City Corporation, by bringing together in the old City of London Court, to the right of the Guild-hall entrance, all the pictures and statues in their possession, continues to receive additions, and promises to become in the future a valuable collection. The gallery, which is open free every day, now contains rather more than a hundred works of art. On Monday there were added to the collection two large water-colour studies, each about 10ft. in height, being the original drawings from which the tapestries recently obtained from the Windsor Tapestry Works for the Mansion House were copied. One represents a joust on London Bridge between David Lindsay, Earl of Crawford, and Lord John de Welles, ambassador of King Richard II. of Scotland, in 1390; and the other the City Champion receiving from the Lord Mayor the City's banner, at St. Paul's Cathedral, in the reign of Henry III. Among the examples of oil-colours lately added are "The Poacher," by E. Bird, R.A., presented to the gallery by Mr. Rome, a member of the Corporation; and "Cymon and Iphigenia," presented by Alderman Sir F. W. Truscott.

THE first of a further course of lectures and demonstrations for the instruction of sanitary inspectors was given at the Parkes Museum of Hygiene, Margaret-street, Oxford-street, W., on Tuesday evening, by Dr. H. E. Armstrong, who took as his subject, "The General History, Principles, and Methods of Hygiene," and the second of the course will be delivered to-night (Friday) at 8 p.m., the topic being "Ventilation and the Measurements of Cubic Space." The lectures will be continued on Tuesdays and Fridays at the same hour, 8 p.m., for six weeks longer, the lecturers being Dr. Armstrong, Dr. Louis E. Parkes, Professor Robinson, Mr. J. Gordon, Professor W. H. Corfield, Mr. C. E. Cassell, Mr. J. F. J. Sykes, Dr. Charles Kelly, and Mr. A. Wynter Blyth.

PROFESSOR TYNDALL, in closing the discussion in the *Times* on lightning conductors, to which we referred last week, remarks that were moisture the only thing needful in the earth connection of lightning conductors, no easier plan for reaching it could be devised than that which Lord Grimthorpe has proposed, but his electric doorway or electrode is too small. Dr. Tyndall would not be content with much less than a square yard of sheet copper for the earth plate, and this might be a square or a rectangle, provided the area be preserved. Faraday proposed a rectangular plate 4ft. by 2ft. He adds that architects and builders would do well to study the "Report of the Lightning Rod Conference," as, while the Report itself is brief and apposite, the appendices (for the statements in which the Conference decline responsibility) are very weighty. It might, he suggests, be desirable for the information of the general public to publish the Report separately.

MESSRS. JAMES MILNE AND SON, Abbey-hill, Edinburgh, showed at their works on Tuesday night a new system for illuminating large open spaces, such as yards, workshops, and sheds, by means of an apparatus termed "the hydro-photogene"—an invention patented by Mr. William Wells, chemical manufacturer, Leith. The light produced resembles that known as the "Lucigen," and the method of obtaining it is somewhat similar. It possesses an advantage over the "Lucigen," inasmuch as no engine, pump, or machinery is required in its production. The apparatus consists of a drum or cistern containing oil, which is forced upwards through a narrow pipe by water pressure from below. Only a small quantity of oil, sufficient to feed a burner, is allowed to pass into the combustion chamber, which, being heated by the flame itself, converts the oil into an inflammable vapour. This vapour then rushes into the burner orifice, drawing a current of air with it in the same way as the Bunsen burner. The air then mixes with the vapour, and a white light is the result. A small damper plays an important part in the operation, stopping the current of air and vapour, and admitting a proper mixture of both into the combustion chamber. It is proposed by the inventor that the apparatus should be connected with a convenient water pipe to obtain the necessary pressure; but where such an arrangement is not available a small hand-pump is fitted in connection with the drum, and by this means water is forced in. The oil used is the cheapest residue obtained from ironworks, which costs 1d. per gallon, one of which supplies the burner for two hours, giving at the same time a light said to be equal to 2,000 candles.

A LARGE tapestry wall hanging representing a fight between Greeks and Trojans has been acquired for South Kensington Museum by purchase from the representatives of the late M. Achille Jubinal, the well-known writer on early textiles. The tapestry is 21ft. in length by 13ft. in height, and is covered with figures in armour and buildings. The treatment of the design is Flemish, of the school of Jan Van Eyck. The Low Latin inscriptions on the scrolls, and the names indicating different personages, enable us to identify the episode delineated with a passage in the poem by a fourth century writer, Quintus Smyrnæus, descriptive of the opportune aid rendered the besieged Trojans by Penthesilea, Queen of the Amazons. The piece was purchased by M. Jubinal from the chateau of the Chevalier de Bayard, near Grenoble, where it is known to have been hanging in 1807.

A SANITARY Congress is being held this week at Vienna, in the hall of the Horticultural Society on the Ringstrasse, nearly two thousand Austrian and foreign members being present. England is represented by delegates from the Universities of Cambridge and Glasgow, and from numerous colleges and institutions, as well as by sixteen private members. A Sanitary Exhibition has been organised in connection with the Congress at the University. On Tuesday a lively discussion was held on the purification of sewage and utilisation of excrementitious products, with special reference to the prevention of river pollution—on which subject Dr. Frankland, F.R.S., presented a paper sketching the history of sanitation in the United Kingdom from 1850 to the present day, and strongly supported the systems of water-carriage sewering and sewage irrigation. The Rivers Pollution Act of 1876 was condemned as an utter failure, and neither cheap, speedy, nor effective. Other papers submitted by Englishmen are: "International Regulations for Epidemics," by Mr. Shirley F. Murphy, in which he recommended that a sanitary authority should be appointed at every port, and that every country should possess a central sanitary office to give immediate notice of all cases of cholera to every Government; another by Professor Corfield on "Rag Importation," one on "English Factory and Workshop Legislation," by Mr. F. Hayes Whymper, of the Home Office; and "Census Returns," by Mr. T. W. Grimshaw, Registrar-General for Ireland. The Congress has been invited to hold its next meeting in London.

MR. B. T. BATSFORD'S new catalogue of new and second-hand books dealing with civil and mechanical engineering, science, trades, and manufacture, is well worth sending for and preserving. The prices—especially of some of the scarcer books—are very moderate, and Mr. Batsford's patrons know that when they do buy a cheap book of him they are sure to find it all there and in good condition, which is not always the case with books offered at apparently low prices.

CHIPS.

A highway bridge of blue brick and stone in seven arches is about to be built at Little Haywood, near Colwich, from plans by Mr. R. Griffiths. Mr. C. J. Nevitt, of Stafford, is the contractor.

St. Paul's Church, Leeds, has been reopened by the Bishop of Ripon after decoration and renovation by Messrs. F. Jackson and Co., from drawings and under the direction of Messrs. Perkins and Bulmer, all of Leeds.

Mr. Thomas Goodwillie, sculptor, Elgin, ex-Dean of Guild, died on Friday, aged 58. Deceased was a native of Fife, and has been upwards of thirty years in Elginshire, carrying on a successful business.

The dedication stone of St. Mark's Mission Hall, Tollington Park, now in course of erection in the Hornsey-road, was laid on Saturday last. The buildings will be Queen Anne in style, and will be built of red bricks, with blue brick plinth and terracotta dressings. The large hall will seat 400 persons, and the smaller one 100 persons. The architect is Mr. W. Jacomb Gibbon, of 36, Great James-street, Bedford-row; the contractors being Messrs. Macfarlane Bros., of Hornsey-road. The work will be completed in December at a cost of some £2,500, exclusive of site and furnishing. The bricks used for the facing are specially made by the Cakemore Brick Company, which firm is also supplying the terracotta and tiles.

Mr. Felix Joseph has just presented to the Local Board of Sandgate, Kent, a number of choice specimens of old Wedgwood ware from his collection, with the view of forming the nucleus of a small art museum in that town.

The new waterworks at Wisham, N.B., were formally inaugurated last week. Additional storage capacity of thirty millions of gallons has been provided at a cost of almost £10,000. Mr. James Tait, the burgh engineer, designed the works.

WATER SUPPLY AND SANITARY MATTERS.

TOTTENHAM.—The Tottenham local board are further extending their waterworks by sinking an artesian well at their Longwater pumping-station. The well is 12ft. in diameter, and is carried down to the chalk; a 24in. boring in the chalk is in progress, and will be extended to a depth of 450ft. from the surface. The new arrangements include two 50 horse-power engines, pumps, boilers, water tower, engine-house, &c. The works are designed and are being carried out by Mr. W. A. H. De Pape, chief waterworks engineer. Mr. W. Brown, of Tottenham, is the contractor for sinking the well; and Messrs. Wilkinson Brothers the contractors for the buildings. The board have recently constructed large reservoirs and a water tower at Mount Pleasant (the highest point in the district), from their waterworks engineer's plans. The works as a whole will cost about £25,000, and when they are completed it is anticipated that Tottenham will possess a system of water supply far superior to that in other London districts. The source is direct from the chalk, and the water stands very high in the monthly official reports of Dr. Frankland to the Registrar-General. A singular feature in connection with the sinking of the well is the variance in actual strata with those shown by the trial boring, in one instance a layer of limestone rock 15ft. thick being met with; the substance having previously been entirely unknown in the district.

CHIPS.

Extensive internal alterations are being made to the old parish church, Tynemouth. The new work consists of the removal of a considerable portion of the galleries, the substitution of hot-water pipes in place of the old system of hot-air flues, and the erection of a pulpit, which is being made from the architect's designs by Messrs. Robson and Sons, of Newcastle-on-Tyne. The contractors for the alterations are Messrs. J. and W. Simpson, of North Shields, and the architect is Mr. Wm. Hope, of Newcastle-on-Tyne.

It has been decided to create in Paris, at the cost of the city, an "Ecole d'Apprentissage des Industries du Livre." The building destined to this service will be erected on the Boulevard d'Italie.

The four panels in the pedestal of the Burns monument at Glasgow have just been filled with sculpture executed by Mr. J. A. Ewing, of that city. The front panel simply bears the name "Robert Burns," and the dates 1759 and 1796; the panel on the left depicts a scene from the "Cottar's Saturday Night," the right panel illustrates the witches' dance in Alloway Kirk, and the fourth panel contains a representation of the vision—Coila crowning the poet with the laurel wreath.

The foundation-stone of a new church, dedicated to St. Hilda, was laid at Darlington last week, by the Bishop of Durham. The building is estimated to cost £5,350.

A new Liberal Club is in course of completion at the corner of Buchanan-street and St. George's-place, Glasgow. It occupies the site of the old Bedford Hotel, which has been altered, enlarged, and re-arranged, from plans by Mr. A. Skirving, West Regent-street, Glasgow.

A new public hall and free library building has just been commenced at Blackford, near Abercairny, from designs by Mr. G. T. Ewing, of Mathill. The large room is 55ft. by 31ft., and all the accommodation is provided on one floor. The memorial stone-laying ceremonies took place on Saturday, when the work was formally commenced.

On Saturday afternoon the memorial-stone of the Speir School, Beith, Ayrshire, was laid with Masonic honours. The school is the gift of the widow of Mr. Robert Speir, of Marshalland, near Beith, and the building is being erected within half a mile of the town. The structure will have a similarity externally to the old University of Glasgow, the architectural features of which belonged to the Scottish 17th-century period. The school will accommodate about 300 scholars, and its erection is to cost £12,000.

Mr. John Sulman, F.R.I.B.A., of Sydney (late of Furnival's-inn, London), has prepared a design for a Centennial Memorial to be erected on the highest point of the peninsula at Port Jackson between the Botanic Gardens and Lady Macquarie's Chair. The scheme embraces the erection of a colossal bronze statue symbolising Australia in the centre of an open court, surrounding which would be a colonnade, in which the history of the first century of the colonies could be recorded in marble. The total cost is from £25,000 to £30,000.

Yesterday, Mr. J. T. Harrison, C.E., an inspector of the Local Government Board, held an inquiry at the Town Hall, Evesham, touching the application of the Town Council for permission to borrow £2,500 for works of street paving. Mr. R. C. Mawson gave details of the scheme.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Society of Engineers. "Stability of Factory Chimneys," by R. J. Hutton. 7.30 p.m.
Society of Architects. Visit to York. Reception and conducted walk through the city, 3.30 p.m. Discussion on "The Architects' and Engineers' Registration Bill," to be opened by H. R. Gough. 7.30 p.m.
Clerk of Works Association. General quarterly meeting, Carpenters' Hall. 8 p.m.

TUESDAY.—Society of Architects at York. Visit to Selby, Beverley, and Hull, 8.40 a.m. train. Discussion on "Yorkshire Architectural Art," 7.30 p.m.

WEDNESDAY.—University College, Gower-street, W.C. "Education, Cultivation, and Examination," a free introductory lecture by Professor T. Roger Smith. 7.30 p.m.
Society of Architects at York. Visit to Kirkstall Abbey and Adel Church, 9.7 a.m. Conversazione of the York Architectural Association.

THURSDAY.—Society of Architects at York. Visit to Ripon and Fountains Abbey, 6.45 a.m. Discussion on "Architects' Charges," 7.30 p.m.

FRIDAY.—Architectural Association. Conversazione at Westminster Town Hall, Evening Dress, 8 p.m. Society of Architects at York. Visits to St. Mary's Abbey and the Minster, 9 a.m., and to Heslington Hall, 3.30 p.m. Discussion on Yorkshire Architectural Art," 7.30 p.m.

ARCHITECTURAL ASSOCIATION,

9, CONDUIT STREET, W.

The OPENING CONVERSAZIONE of the Session 1887-88 will be held on OCTOBER 7, at Westminster Town Hall, at 8 p.m. The FIRST ORDINARY MEETING on OCTOBER 21, when the President will deliver an Address.

The FIRST MEETINGS of the CLASSES as under:—

Oct. 10	..	Graphic Statics Lecture	7.0 p.m.
„ 13	..	Elementary Class of Ornament and Colour Decoration	6.30 p.m.
„ 26	..	Advanced Class of Construction.. ..	7.0 p.m.
„ 27	..	Quantity Class	7.0 p.m.
„ 28	..	Lecture on Construction	6.30 p.m.
„ „	..	Elementary Class of Construction ..	7.45 p.m.
„ „	..	Class of Construction	7.45 p.m.
Nov. 10	..	Ornament and Colour Decoration Class	6.30 p.m.
„ 11	..	Lecture on History of Architecture..	6.30 p.m.
„ „	..	Elementary Class of Design (Section I.)	7.45 p.m.
„ „	..	Class of Design	7.45 p.m.
„ 16	..	Elementary Class of Design (Section II.)	7.0 p.m.

A Syllabus of the Class Work can be obtained from the following Class Secretaries:—

ELEMENTARY CLASS OF CONSTRUCTION:—
H. E. MATTHEWS, 11, Dowgate-hill, E.C.

CLASS OF CONSTRUCTION:—
H. D. GRAVELL, 37, Stormont-road, Lavender-hill, S.W.

ADVANCED CLASS OF CONSTRUCTION:—
G. A. LANSDOWN, 67, New Kent-road, S.E.

QUANTITY SURVEYING CLASS:—
W. J. BAMBER, 1, Tenterden-street, Hanover-square, W.

GRAPHIC STATICS LECTURES:—
F. QUICK, 157, Wool Exchange, E.C.

ELEMENTARY CLASS OF DESIGN (Section I.):—
C. J. WILLET, care of Messrs. Taylor and Locke, St. Michael's House, Basinghall-street, E.C.

ELEMENTARY CLASS OF DESIGN (Section II.):—
W. E. JOHNSON, Fern Villa, St. James'-road, Upper Tooting, S.W.

CLASS OF DESIGN:—
E. H. PARKES, Wittersham Rectory, Ashford.

CLASS OF COLOUR DECORATION:—
E. HERBERT, 11, Mornington-road, N.W.

THOS. EDWARD PRYCE, FREDERIC R. FARROW, } Hon. Secs.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, post free.—LESSER FRIEDLANDER, Tobacconists' Complete Furnisher, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 60 years.

Holloway's Pills.—Easy Digestion.—These admirable Pills cannot be too highly appreciated for the wholesome power they exert over all disorders of the stomach, liver, bowels, and kidneys. They instantaneously relieve and steadily work out a thorough cure, and in its course dispel headache, biliousness, flatulence and depression of spirits.

HYATT'S LENS and "SEMI-PRISM" LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

BATH STONE.

PICTOR'S MONKS' PARK. CORSHAM DOWN.
BOX GROUND. FARLEIGH DOWN.
COMBE DOWN. STOKE GROUND.
WINSLEY GROUND. WESTWOOD.
PICTOR and SONS, BOX, WILTS.

DOULTING FREESTONE.

THE CHELYNCH STONE.—This Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

HAM HILL STONE.

Greater facilities have been provided for working these Quarries, and the Stone can be supplied in large quantities at short notice. Prices and every information given on application to

CHARLES TRASK and SONS,
NORTON-SUB-HAMDON, near ILMINSTER, SOMERSET.
London Agent:—
E. A. WILLIAMS, 16, Craven-street, Strand.

BEST BATH STONE.

FARLEIGH DOWN, CORSHAM DOWN
BOX GROUND, COMBE DOWN,
WESTWOOD GROUND.
STOKE GROUND.

RANDELL, SAUNDERS, & CO., LD.
CORSHAM, WILTS.

WM. OLIVER & SONS

MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind Wood in Planks and Boards, dry and fit fo immediate use.

TENDERS.

*** Correspondents would in all cases oblige by givi the addresses of the parties tendering—at any rate, of t accepted tender: it adds to the value of the information.

ARNOLD.—For paving, curbing, channelling, a culverting in West Pond-lane, Arno'd, for the Arno Local Board of Health. Quantities by Mr. Jackson, Low-pavement, Nottingham, engineer:—

	A.	B.
Haywood, F., Wortley	£1,062 18 0	£266 5
Barry, D., Nottingham	733 11 3	187 3
Hawley, J., Ilkeston	596 16 0	163 5
Vickers, H., Nottingham	596 0 0	185 0
Bradley, J., Lincoln	569 14 0	221 15
Cordon, W., Burton Joyce	547 9 6	146 16
Greeves, J., Front St. Arnold	*518 0 0	*146 0
Morriss, E., Arnold	500 0 0	160 0
Shortland, J., Nottingham	441 19 6	161 16
Engineer's estimate	561 15 6	154 12

A.—Contract No. 1. B.—Contract No. 2. * Accepte

BEDFORD.—For two cottages to be erected in Mi brook-road, for Mr. Wm. Day. Mr. R. Lund, architect Todd, G., (accepted) £254 10 0

BELLAGIO.—For the erection of a bungalow at Fur field Chase, Bellagio, near East Grinstead, Surrey, for M J. H. Mackay. Mr. W. J. Ebbetts, F.R.I.B.A., Sav House, 115, Strand, W.C., architect:—
Baylis, H. £423 0 0

BELLAGIO.—For the erection of bungalows at H Crest, Bellagio, near East Grinstead, Surrey, for M A. Burr. Mr. W. J. Ebbetts, F.R.I.B.A., Savoy Hou 115, Strand, W.C., architect:—

	A.	B.
No. 1 Bungalow	£180 0 0	—
„ 2 „	275 0 0	*£295 0 0
„ 3 „	340 0 0	*360 0 0
„ 4 „	390 0 0	425 0 0
„ 4a „	455 0 0	*475 0 0
„ 5 „	305 0 0	*325 0 0
„ 6 „	300 0 0	315 0 0

Tenders submitted by Mr. H. Baylis, builder, of Hig bury. Those marked with an asterisk being accepted.

BLACKHEATH.—For alterations and additions to Three Tuns, Blackheath, for Mr. F. Walton. Mr. J. Downes, 183, Lewisham High-road, S.E., architect:—
Schofield £750 0 0
Holloway, H. L. 740 0 0
Lorden and Sons (accepted) 650 0 0

BOURNEMOUTH.—For works of road making, for t improvement commissioners:—
White, J. (accepted) £1,430 0 0

BOURNEMOUTH.—For tree and shrub planting, for t improvement commissioners:—
Smith and Co., Worcester (accepted) £101 14 0

BRISTOL.—For additions to leaf room of toba factory at Bedminster, for Messrs. W. D. and H. O. Wi Mr. F. W. Wills, architect:—
Beaven, A. J. (accepted) £811 0 0

BRIDGE OF WEIR, N.B.—For the erection of a n station at Bridge of Weir:—
Smellie, J., Partick, near Glasgow (accepted).

CHESTER-LE-STREET.—For block of offices and cotta near The Hermitage, for Mr. Lindsay Wood. Mr. G. Irwin, Sunderland, quantity surveyor. Mr. H. Gradon, Durham, architect:—

Tremble and Co., Hetton-le-Hole	£1,452 8 0
Haswell and Waugh, Gateshead	1,441 12 4
Atkin and Co., South Shields	1,397 0 0
Gradon and Son, Durham	1,382 3 0
Thompson, W., Chester-le-Street	1,365 0 0
Bell, G. H., Bishop Auckland	1,360 8 0
Kell, J., Birmingham	1,360 0 0
Douglass, G., Sunderland	1,354 0 0
Lodge, W., Plawsworth	1,337 8 0
Thompson and Son, Chester-le-Street	1,334 2 0
Atkinson, W. C., Stockton-on-Tees	1,326 0 0
Robson and Son, Chester-le-Street	1,322 6 0
Sanderson, R., Birmingham	1,320 0 0
Jopling, J., Chester-le-Street	1,305 5 0
Forster, W., Croxdale	1,300 0 0
Akenhead, T., Stamfordham	1,293 8 0
Wood, T., Jarrow-on-Tyne	1,231 13 0
Kilburn, J. G., South Shields	1,217 0 0
Jennings, J., Chester-le Street	1,123 0 0

CHELSEA.—For the erection of two studios at Leonard's terrace, for Messrs. Cooks and Elwor (design No. 2). Mr. W. J. Ebbetts, F.R.I.B.A., Sa House, 115, Strand, W.C., architect:—
Baylis, H. (accepted) £615 0 0

HE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1709.
FRIDAY, OCTOBER 7, 1887.

PROFESSIONAL CUSTOM.

EVERY now and again the architect has to appeal to what is rather ill-defined s the "custom" of the profession. Unfor-unately the custom varies, or may be so nreasonable that when the hapless victim of harp practice makes an appeal to the ribunal of the law he finds out to his dis-nay that the Court is ready to set aside a 'trade custom" if it happens to be un-easonable, and cannot be established upon very clear evidence. So, not many years ago, a late eminent architect found to his cost hat he could not legally retain the drawings nd specifications that had been prepared for a great public building, and that his em-ployers were held to be the owners of them ; while another decision has destroyed the custom which till then had been pleaded, that an architect is entitled to remuneration in the event of the plans being abandoned. And it will be readily seen that "custom" would lead to the perpetuation of a great many follies and a great deal of injustice, if it were at all times held to be unassailable. Law would have made but few advances if custom had ruled instead of reason. Yet, for all this, evidence of usage or custom is admissible, and often goes a very long way in establishing a case upon technical points. Upon this ground there are a number of architects who appeal to custom whenever anything goes wrong, or they fall out with their clients. We have endeavoured before to show that this ground of conviction and solace may often be shaken, and that it is better for the architect to go into the business forearmed and to prepare himself for contingencies that may happen.

One of the instances in which this precau-tion is so necessary is when an architect undertakes to prepare designs and drawings for a number of houses or villas upon the same plan. The circumstances re-lated by a correspondent in a recent issue under the title of "An Architect in a Fix" is not an uncommon experience. A client requests the architect to prepare plans for two pairs of houses at £2,000 each pair. Plans and specifications are accordingly prepared, and tenders obtained ; the house is commenced and proceeds till roof high, when the client intimates to the architect that he will be his own architect for the second pair. The builder is instructed to begin the work, using the plans and specifi-cations prepared by the architect. The employer refuses to pay any commission on the second pair. Now, the instruction was to prepare plans for *two* houses, not one—a point which may be looked at in different ways. It may be said, as the houses were to be alike in all respects, it mattered nothing to the architect whether there was only one or a dozen copied ; in preparing a design for the one he expended so much skill and labour, and no more, and he received the usual com-mission for his labour ; that it would be easy and quite optional for a client after one house has been erected to copy the other from the house already built ; that the architect incurred no responsibility or trouble in respect of the second house, the plans of which had been paid for. On the other hand, it may be said that *two* houses were spoken of ; the architect made his arrangements and calculations accord-ingly, and that it was breaking the agreement —verbal or otherwise—to pay for only one house when two are built. The architect also by this transaction may regard himself as a loser of half the expected commission, and so consider himself an aggrieved individual. No doubt this kind of treatment is unfair, if not exasperating, though on reflection the architect has lost nothing by the transaction, any more than he would have done if the client had ordered the plans only for one house, and someone else had built another house on the same plan and with the same features. We are all aware how a design for one house or pair of villas is repeated on building estates ; it is not uncommon, indeed, to find an architect's design copied exactly or wretchedly travestied on the same estate. But what can be done to stop this kind of prigging ? When a design is paid for by a client there is no law to prevent him or any-body else from erecting any number of houses on the same plan. Where the hard-ship appears is the promise to build a pair, holding out the commission to the architect, and then after one house is far advanced for the client to turn round and tell his architect that he can dispense with his services in building the second on the same plan. But the architect's work is clearly divisible when the same design is to be repeated.

Something can be done to prevent these dis-appointments, and the architect has it in his power to do so. He can always guard against disappointment of this kind by considering what is possible to happen, and make a special provision or agreement to meet it. Probably the chief reason why the agreement is not common amongst architects is because it is not the custom, it does not look "profes-sional" ; but all hesitation would be removed if a form of agreement were generally adopted and signed by employer and architect in the same manner as a contract relating simply to questions of professional usage. What a host of difficulties might not such a form remove ! It would obviate disputes as to what is the customary remuneration, as to the ownership of the plans, as to the authority of the archi-tect, and with respect to questions of cost, preliminary drawings, contingent services, and other questions. A very large field is open to question and cavil by depending solely on custom and usage, though the archi-tect prefers it to restraint ; perhaps the un-popularity of agreements between architects and their employers arises from the notion that the agreement would be too much of a tie. The architect would not be kindly dis-posed to adopt a form prepared by some lay-man, for instance, especially one who has shown rather hostile feelings towards the profession, and we cannot altogether blame him for declining to sign any of the forms that might be submitted to him. A form of agreement to be generally acceptable ought to be prepared with great care and foresight by a body of architects of reputation, and should then be submitted to a body of gentle-men who had experience in building operations. Their joint strictures and emendations might then become the basis for an agreement, such as that which is used for building contracts. There is a common mistake made about the authority of any profession to make laws binding on other people ; architects can make any rules they please as members of any corporation or society to regulate their own proceedings, but they have not the power to make rules to govern those outside their own craft. For this reason it would be useless to attempt to lay down rules or deci-sions of their own about the duties and legal rights of themselves. It is true they can draw up agreements that shall express all they want, and get employers to sign them ; but they would not thereby make them binding on all. An architect may agree him-self not to undertake any design, or prepare drawings and specifications for any building unless he is paid the full commission, whether the employer abandon his intention of build ing or not. He can easily dictate his terms to a client about to erect several houses on the same design, and say that he will under-take them only on the condition that he is paid a commission on all of them, whether he carries them out or not ; he can decline to undertake any work below a certain commission, or to pledge himself to give up the plans to his employer. He may decline to bind himself not to exceed the estimate ; he may, in short, not commit himself to anything he considers injurious to his profession. It is quite optional for anyone to agree upon this procedure, and to be independent of custom altogether. Such rules would not, however, be agreed to by other less independent members of the pro-fession, and they have a right to be con-sulted, and the employer has equal rights to obtain services upon his own terms, and to draw up an agreement incorporating them. In point of fact, there is nothing to bind either party ; each is free to act as he likes. But when there is no agreement, custom is the only guide, and each party is amenable to the decision of the Court.

A number of questions arising in the practice of architects come before the legal tribunals. We have alluded to one of them. A very similar case is where an architect pre-pares plans for a building, and after they are ready for contract the employer does not proceed, or proceeds only to a certain stage, and then stops. What can the architect charge ? Supposing the contract plans are all ready, and the client alters his mind or does not proceed, the architect has a right, according to custom, to charge half the com-mission, or, including obtaining tenders, 3 per cent. Even this custom has been ques-tioned ; and in a published form of agreement the following clause is suggested : "If, after working drawings have been made, the said employer does not proceed, the said architect shall be entitled to a fixed sum to be agreed beforehand, and the plans, &c., shall belong to the said employer ; or, if the said employer proceeds only with a part of the works, the said architect shall be entitled to a propor-tionate part of the remuneration (to be fixed), in addition to a proportionate part of the sum mentioned in this article in respect to work abandoned." We have nothing to object to this arrangement, provided it is agreeable to both parties ; and it would be judicious, we think, for an architect to provide in this manner for services that may be only partly required. Custom and a "reasonable" con-struction put on the facts of the case by a jury are not at all satisfactory, more parti-cularly when the employer abandons his in-tention or only carries the works to a certain stage, and then dismisses the architect. Judges and juries are disposed to look upon the architect's services as running only with the work, that when it stops his charges should stop too ; but is this a fair way of dealing with him ? His plans and specifica-tion are for the work in its entirety, not for any portion, and should his services be sus-pended or stopped during the progress of the building, it is reasonable that he should be able to charge the commission on the com-pleted work. A recent decision, if we re-member rightly, has confirmed this view. The architect's design is fully discoverable after the building is advanced, and it would be unfair towards him if an owner could take advantage of this circumstance and complete the building without the further services of the architect.

Only at certain recognised stages can his work be considered divisible. Thus, after the tenders are sent in, if the cost is found beyond the owner's means, he can refuse to carry out the design, which up to this juncture is expressed only in the drawings and in the architect's brain. It is practi-cally undisclosed, though the architect can charge his commission on the work he has done. It also appears reasonable that when the same plans are prepared for two houses, and only one is executed by the architect,

he should be able to charge at a lower rate on the other when it is built from the same plans as provided for in the Institute schedule of rules; but certain conditions are to be observed in the schedule, the buildings are to be erected at the same time from the same plans, &c., and under one contract. There is only one way to make the owner liable, unless, indeed, there is any evidence from which the Court may infer that two houses were intended. If it can be proved, for example, that the same plans were used in the erection of the second house, a good ground for action may be obtained. Again, if the architect received tenders for both houses he would have a *primâ facie* claim for remuneration. When such proofs are wanting custom alone will determine. Probably one of the strongest objections to special agreements is that an architect would not care to press an unwilling client to sign any undertaking. The younger amongst the profession would possibly find it an impediment to their employment. At first there may be difficulties in the way; but these would disappear when the practice become general. Where authoritative decisions of the law are wanting, there is more reason why understandings of this kind should be made. On the question of ownership of plans this course is recommended. Why should not other points which are still only controlled by custom be also made subject to agreement?

THE BUILDING HANDICRAFTS.—II.

THE plasterer is one of the old and venerated handicrafts. Like the mason, he had a great deal of the artistic part of the architect's design to carry out, and like him also, he has of late years suffered from the introduction of various kinds of wall-linings and embellishments in materials other than plaster. The London plasterers were incorporated into a guild in 1501, and in 1603, in the reign of James I., it was enacted that no plasterer should exercise the art of a painter in the City or suburbs; but an apprentice was exempted, from which we infer that at that date the plasterer often undertook to do painting. Later, in 1694, it was enacted that those practising the art without being members of the guild could be fined. From various accounts it is certain that the old plasterer was more of the artist than his modern descendant, and his work consisted chiefly in the decorative work of walls and ceilings. Especially in the ceilings of the Tudor and Stuart periods does the art of the ancient plasterer become an important element in the internal architecture. The modern plasterer's work is of a purely mechanical nature—he is not instructed in the art by the Italian masters and hand-workers in stucco, like his forefathers were, who were engaged by Gibbs, Chambers, Adam Brothers, and other eminent architects. Few who pass the Strand know what a masterly example of the art of the plasterer of the 18th century is to be seen in the interior of Gibbs's fine church now being "restored"; the apsidal semi-dome, and the flat elliptical vault in one span, exhibit some excellent foliage in the redundant style of Le Pautre, all worked entirely by hand. We can show little modern decorative plasterwork like it. The cause of the decline in this art, as in that of the carpenter, carver, and mason, is the introduction of mechanical appliances. No sooner was the art of casting in plaster introduced than a change began, and the fine school of ornamental modelling quickly died out. The Plasterers' Company, by their yearly prizes for designs and models, are doing a good work; but plastering of the ornamental kind is now intrusted to a few well-known firms of repute, who employ artists of their own, and who work in fibrous plaster or carton-pierre, and turn out decorative plaster work of a superior kind, wanting, however, in some of the qualities which give the old plasterers' work its undisputed charm. It is the handwork and individuality of character which strike us in the old Elizabethan or Jacobean ceiling, an art which would not pay in modern buildings in which cheapness of production is the only aim. Decorative plastering is almost a defunct art amongst the trade. The mechanical process of plastering walls and ceilings has little to raise the operative to the rank of artist. Recent substitutes, in the form of "Linerusta Walton wall decoration," faience "appliqué," and several kinds of wall hangings have no doubt transferred much to other hands. There is one branch, that of rough casting, as seen in the old houses in Kent, and employed decoratively on half-timbered houses, that has been lately developed, and the "wattle and plaster" business has made a new start. A field for art might be made by ornamental plaster surfaces, such as are common in Spain. The decoration of the Moors consisted of fine plaster carved into mouldings and diapers of elaborate design. In this class of work would be found certainly an opportunity for the artist in plaster.

Some time ago there was a scarcity of plasterers, and the Builders' Association issued a circular to master plasterers urging them to take on apprentices. The abolition of "hawk boys" has been the gain of the London plasterer, though his position is not what it might be. Efficient men are not numerous; but the cause will be found to be the prevalence of the system of "labour only" or task work. The builder finds this system the cheapest; the work is let to the lowest bidder. How can good work be turned out under this system? The London plasterers are scarcely alive to the danger of work done under these conditions, which ought to be left only to the few who care to do work under them; but taskwork has been injuring other trades in the same manner. There is yet a hope of improvement in spite of the changes that have taken place. When every plasterer has been taught to model, we may have a class of men worthy of those artists in plaster whose works grace the interiors of the 16th and 18th centuries.

Two other classes of operatives have contributed more to modern architecture: we mean the engineer and the plumber. The engineer has done something to develop the resources of the art by developing the intractable material, iron, though we must wait patiently before the results are seen. Up to the present time iron construction has been rather the stumbling-block than the aid of the artist. There is much yet to be done before the architect can use it freely and artistically, and except in artistic wrought metal-work no school has pre-existed; still, there is hope and a great future for iron in architecture, of which stage we have scarcely reached the threshold. Not till the engineer is educated in art and the architect in iron construction will progress be made. Lord Hartington's address the other day to members of the Iron and Steel Institute at Chatsworth is worth bearing in mind: we must not only develop our resources, but boldly deal with modern inventions. The plumber has made rapid strides in education, and the registration of the plumbing craft is already a significant sign of a new order of things. Of all the old crafts, his is the only one which has advanced from the sheer pressure of circumstances.

Under the generic term of "decoration" we may include various handicrafts, like those of the painter ceramist, glass-painter, mosaicist, and carver, whose separate existence as professional contracting artists was unknown in the old days. Are these contributing their quota to modern architecture, or are they simply earning livelihoods as professional artists or "sub-contractors"? On the whole, the building operative is no longer in the position to influence style as he did once when he was a master of material, and could design as well as work in it. With the revolution created in many trades by the introduction of machinery, the operatives have lost interest in art labour, and have become mere mechanical experts. They work away from the building, not in it, through the intervention of a superior, not independently. Was a few idealists wish to see a return to the old plan by which every working artist had his share in the construction and design. We may not hope for that, indeed, it seems impossible under the changed order—the reconstitution of the trades; but we may look forward to a time when for the present disorganised condition of the trades will be substituted a body of skilled operatives to whose hands can be intrusted the general design and directions of the architect. Comparing modern with the ancient organisation of operatives, we note an important difference.

At the beginning of the 12th century we find the freemasons were an important body, and were exercising a potent influence on the change of architecture that took place. Other trades were then organised; each had its master, yeat-master, and other officers, and was recruited from apprentices who had served their time in the trade. These trades were competent to make improvements as time went on. If in one church they found any feature defective or wanting in dimensions and details, it was noted, so when the next church was built the fault was rectified. New forms of arrangement of plan, of arches and vaulting, of masonry were developed by this process of improving on what had been done before. The trades or ecclesiastical functionaries would discover any errors in plan, the master masons in details of construction, and as the works progressed these alterations and modifications could be introduced with little or no trouble. Each craft had its share in the improvement. Drawings to small scale would not be required to instruct the workman about matters which could be pointed out, and if such were needed they would be sketched on the works to a full size. These gradual modifications and improvements, carried on through generations, and by different minds and classes, developed the art in a much more natural manner than if one individual were engaged to design a new church de novo without previous experience, and by the lights which only traditional types could furnish him. In short, improvements were not due to one or two eminent professional artists; but to a succession of artists working each in his own materials through a number of years uniting in great works of architecture.

These ideas of progressive art, though not new, may appear revolutionary to the conventional architect's notion of treating design and execution as distinct and separate functions. We will not allude to the work of eminent laymen, such as Mr. Ruskin or of Mr. Morris, both of whom have laboured to show the working artists their share; but we may, in conclusion, quote the following very pregnant sentence from a recent paper by a well-known architect this year: "Old architecture was craftsmanship or it was nothing. The thews and sinews of old designs were in the trades. Old architecture was not like modern architecture, the creation of the architect's office—it was the creation of the workshop: the workshop was its home, the tradesman's bench was its cradle, tradition was its foster-mother." So says one of our rising architects, who points out that the vast majority of our parish churches were both designed and built by skilled workmen.

If workmen in England were encouraged as they are in France, we should have to record more rapid progress. As all know who

ainted with building operations in
ne, the various trades are carried on by
ntists, or specialist contractors, who are
operatives. Each workman under this
em can lend great aid to the architect in
rying out his design; he can point out how
where a particular material can be
ployed; he takes an individual interest
his labour, for his desire is to please the
itect who appoints him; he has no inducee
to run up the cost, for he can execute
work at a less profit than the general
tractor. The architect in this manner
rounds himself a number of artist-operatives
work with him; he can select his own
n, those who understand his style and
s, and who take a personal interest in
For many years these operatives may
s for one or two architects. The system
working is therefore quite different
that in this country. There is another
nt that ought to be mentioned in con-
ion with workmanship abroad. Prizes
given for executed work. The Société
rale des Architectes award prizes to all
sons who have executed work of merit,
with this object a committee of inquiry
pointed to ask all architects to send in
names of all workmen who are deserving
ward. Architects and manufacturers
re recipients of prizes and medals for
ed work. The English operative has
this interest taken in him, perhaps partly
ng to his own indifference and want of
. Contrasting the cost of English and
gn labour, we know perfectly well why to
glish contractors obtain foreign labour.
ders, masons, carpenters who take large
s tell us that the rate of wages per hour
ractically more for an English workman
a foreigner; in one case we know of a
-known mason and carver in the West of
land who some time ago paid 1s. 6d. per
, besides lodgings and other extras, to
ainer, for work which afterwards he
ed a Prussian workman to do for him
t half that rate. During the progress of
Law Courts, the employment of foreign
ur was, we believe, a necessity, and few
r contractors will hesitate to employ
gn labour. America, Germany, France,
and, Belgium, and other countries have
extensive factories competing with our
in the cost of production, and in future the
try that can produce the cheapest and
will be the leading one. We have here
dition for the poisonous statement to
, 'How is machinery likely to benefit
working artisan?' We see him outstripped
e race by foreign machine-turned-out
s.

e tendency is still to reduce the
of labour in producing, the effect of
h is to undermine the labour of men
work with their brains as well as
, though the case is different with
who are not specialists and contractors.
nglish kinds of artistic production are
ond their heads, and no machine has ever
able or is likely to accomplish purely in-
ual or artistic work. But we are now
ing of a large class of operatives and
rkmen, including modellers, carvers,
ural workers, and designers and painters
ass, and engaged in the production of
ssels. Other countries are taking away
We rather say, commanding our staple
rades. If, as some assert, the goods
anufactured in this country are diminish-
our work is indeed a sorry one, for we
the other fact before us that the popu-
of the country is increasing. If true, the
nd for labour is on the decrease, we are
ubled to the conclusion of a still further
owing process to avoid the miseries
a large surplus of unemployed labour
to create. There are a number of
ons who augur ill for the future of in-
in this country, who say that we shall
e to pass through a commercial crisis of
still greater severity than we have yet done. There is only one hope for the mechanical labourer and operative artist, and that is to make himself an expert at his work for after all the best must qualify the condition of cheapness, and thereby throw cheap inferiority on one side. There are, too, unworked fields for labour which may be thought of. Here is another opening. The substitution of mechanical for human labour is what most concerns the workman of to-day. How is he to keep his position and raise his work to the level of an art? The more he can do this, the greater chance he has in the struggle.

ROYAL INSTITUTE OF PAINTERS IN WATER COLOURS

IN the galleries of the Royal Institute of Painters in Water Colours an interesting exhibition has been opened to the public this week of the paintings, etchings and water-colour drawings contributed by several hundred artists to the Art Union, inaugurated for the purpose of furnishing means whereby the Institute may secure the property and galleries of Princes Hall as a permanent home in Piccadilly. The prospectus announces that £15,000 worth of pictures will be given as prizes, and each subscriber is to have a photographic copy of Sir James D. Linton's grand picture entitled "The Declaration of War," which was exhibited in the Royal Academy a few years since. There can be no doubt as to the assured success of the undertaking, seeing that already over 4,000 pictures chiefly by well-known painters, have been contributed, leaving still promised works by such men as L. Alma-Tadema, R.A., J. E. Burgess, A.R.A., Fred. Goodall, A.R.A., E. Blair Leighton, A.R.A., H. S. Marks, R.A., Sir J. E. Millais, R.A., Joseph Nash, R.I., J. W. Waterhouse, A.R.A., and over 100 others yet to come in. The collection naturally includes not a few frames containing familiar studies or pictures which have seen the light on more than one occasion, while there are some which, if the truth must be told, should never see the light again, at least in such company as that in which they now appear. These will, we suppose, count as so many prizes, and thus swell the attractions of the list to the general public. We question the wisdom, however, of showing such things, especially when there are so many really good pictures presented to the Art Union. To notice all such contributions or even a fair percentage of them, would take far more space than remains at at our disposal here; but we will briefly go over our notes as they appear in the catalogue. Sir James D. Linton, the president of the Institute, gives an exquisitely finished study of a girl's head in a white mob hat, calling it "Ellen," a charming face treated with considerable thought of Jessie Lidwell, in massive mouchoirs rests the painter's strength, while he generally fails in composition. Mr. E. M. Wimperis, R.I., sends a characteristic "Autumn Evening," and Mr. Ernest Parton delights us with a glimpse of the river called "The Thames at Maple-durham." Few can paint old architectural-esque subjects of a grandiose kind like Mr. John Fulleylove, R.I. His "Window of the Long Drawing-room, Hardwick Hall," is a scrupulous rather for want of interest in the subject: but Christ Church, Hants, down the gardens looking over the water where the hollyhocks grow, is a rich specimen of his work which one would be fortunate to own. Mr. F. G. Cotman, R.I., gives us a harmony in greys and yellows, called "Mending the Lock," and Mr. Seymour Lucas, A.R.A., sends a sketch marked "The Reader," a bold-ing figure in light tones, ruby plush breeches, wide collar, and blue sash. Mr. C. Burton Barber seldom fails to win a hearty approval, and "Kittens" is sure to be popular as a solid piece of work illustrating a young girl seated in a wicker armchair playing with a little cat. There is, however, more true grit in Mr. Edwin Hayes's "Dutch Boats Waiting a Signal to Reach Scheveningen," and we find more sentiment of thought and idea in the "Dinner Hour" by Mr. J. C. Dollman, R.I. In this latter we like the subdued tones and attention for holidays without glare, and the scenery without mere greenness. Two tired plough horses rest by the roadside while the ploughboy takes his modest meal under the shady hedge. Nothing could be more unsophisticated, and yet the picture illustrates a page of real life very cleverly. Mr. Edwin Hayes, R.I., is generally seen at his best in his smaller canvases of Scotch scenery, and "On the Shore of the Moor" is certainly one of these, which, like "Near Nuneham, on the Thames," by Mr. R. Hallgarten, would be welcomed in any home. Of still life there are perhaps, not many specimens; but "Wallflowers," by Miss C. H. Norman, is a fine one. Mr. Charles Green, R.I., is fortunately much interested in the Art Union, and therefore has given three or four of his masterly drawings of Old English life to the exhibition. "Tête-à-Tête" is one of them. On a blue satin sofa, by a sombre red curtain in front of a century damask wall, sit two musical admirers. The girl in a white silk frock powdered with roses and set in black knee breeches costume and a grey wig. An old fellow "Taking Snuff," by the same hand, is quite Meissonier-like in finish and "A Fleet Marriage" too, is another specimen from Mr. Green's fertile pencil. The "Place d'Armes, Vitre, Brittany," by Mr. L. J. Wood, R.I., is an architectural water-colour; and "Amused," by Mr. F. P. Bassano, is another. Messrs. Arthur Severn, R.I., S. P. Dadd, R.B., and James Orrock, R.I. send other beautiful pictures in pastel ones; and Mr. A. E. Haigh, ever charming in his work, graces the gallery with a "Quiet Corner," "Toulouse," "Every Time Mark's Appeared For your Thief" by Mr. Frank Dadd is a comical picture, admirably rendered of highwaymen.

THE SOCIETY OF ARCHITECTS AT YORK.

DURING the present week the members of the Society of Architects are holding their annual meetings in the ancient city of York. An informal reception of the visitors took place at the Church Institute on Monday afternoon, and shortly afterwards the members of the society visited the Guildhall, St. Martin Church, the Merchants' Hall, and other places of interest in the city. In the evening the first meeting was held at the Church Institute, when the chair was taken by Mr. W. Hopper, President of the York Architectural Association. The chairman, on behalf of the local association, gave a hearty welcome to the visitors, and then referred to the Architects and Engineers Registration Bill, which it is proposed to have introduced to Parliament next session. He was sure that the society was doing the right thing in promoting the Bill, as it was evident that something was done to place the profession on an equal footing to that of the surveyor or engineer, and it would give it a more standing and better social position. For the welfare of the public also, it was necessary that architects should be properly qualified to undertake and sanitary science as well as to art, and in order to ensure the possession of the necessary qualification, it was necessary that compulsory examinations should be held.

Mr. Hugh Roumieu Gough, F.R.I.B.A., past-President of the Society, then read the following paper on

THE ARCHITECTS AND ENGINEERS REGISTRATION BILL.

The subject which we have met together to-night to consider is undoubtedly one of the

most important which has ever occupied the attention of our profession. At the present time we are without organisation, and it is open to anyone, however ignorant he may be of construction and sanitary science, building materials and labour, and the cost of the same, to call himself an architect or engineer, and to practise as such, provided only that he can find clients to intrust work to him; and, alas! we all know how easily such charlatans do secure work, to the lasting disgrace of what should be a noble profession. What would be thought now if any ignorant person could, of his own will and pleasure, and without any previous training, commence practice as a doctor or a lawyer, and what would be thought of those foolish enough to employ them? The object we have in view is to raise our profession to the status enjoyed by medicine and law, and one would scarcely think it possible that any reasonable being could oppose such efforts as we are making. Ask any medical man or solicitor what he would think of getting rid of registration and examination as a test of qualification to practise, and he will probably doubt your sanity; yet such are the jealousies, ignorances, and vanity of many members of our own profession, that there are men calling themselves architects, and even enjoying good practice, who are vainly opposing a scheme intended for the benefit of their fellows no less than that of the public at large. It has been a study of mine for very many years past how to bring about the genuine reform of our profession, and when the Royal Institute of British Architects was considering the question of a new charter I made endeavours to secure the adhesion of all in practice to that body, in the hope that efforts might then be made to obtain the necessary legislation. The resolutions I proposed were ridiculed by the *Builder*, which is rightly or wrongly looked upon as the organ of that body. I then turned my attention to the Society of Architects, in the formation of which I had taken a deep interest, and which did me the honour to elect me President in two successive years. The energy shown by the Society seemed a striking contrast to the apathy of the Institute, and that this energy has been appreciated may be seen in the fact that we, in the commencement of our fourth year's existence, number more members than the Institute did after 25 years. Let it not be thought for one moment that I wish to speak ill of the Institute, of which I am a Fellow of many years' standing. I would gladly see it take the lead in every effort made for the well-being of our craft, and fully recognise the fact that it ought to do so. I heartily approve of the excellent examinations it has appointed for those desirous of becoming associates; but what I feel is that these examinations, although of the greatest benefit to those who qualify for them, are practically useless to the profession at large until they are made compulsory on all desirous of calling themselves architects. The same remarks of course apply to the Institution of Civil Engineers' examinations. So long as men can practise without any examination to test their qualification and right to do so will these examinations be useless to the profession at large, however beneficial they may be to individuals. We all know that there are many able men, about whose skill and qualifications there cannot be the shadow of a doubt, who belong neither to Institute nor to any professional society whatever. It is these men and others who have won their reputation already, and have nothing to gain themselves by such An Act as we seek to obtain, who are our opponents. One, I know, has declared that he would rather retire from practice than register under the Act. Can anything be more short-sighted? It is perfectly true we cannot make men artists by Act of Parliaments, but we can insure that all shall have a proper technical education, and learn the art of construction before commencing practice, and gaining, if he ever does, his knowledge at the expense of his clients. We have, alas, already too many merely artist practitioners, ignorant of materials and construction, and I say unhesitatingly that these gentlemen are a very curse to the profession. They openly say they are above mixing themselves up in trade affairs; they are totally unable to estimate the value of work, and such a prosaic matter as the drainage and ventilation of a building is left by them to their quantity surveyor. No wonder that their clients think them, when too late, either knaves or fools, and imagine the entire profession may be included in these terms. Much has been said to me about the expediency or otherwise of including civil engineers in the Act we are endeavouring to obtain. Can anyone say that these are two distinct professions? Examine the derivation of the term "architect," and we find the meaning to be "chief constructor." The same knowledge which every architect requires and ought to possess to enable him to design a girder, say, for a shop front, is precisely the same which the engineer needs to enable him to bridge over a river or a railway. The only difference I can see between the two branches of the one profession is this—viz., that at present the architect too often is very ignorant of construction, and unable to calculate the strains upon a truss or girder, though frequently a man of much artistic taste, and that the engineer, on the other hand, is usually a perfect master of construction, but generally utterly devoid of, and caring nothing for, art. How is it possible to separate the two branches? Hideous as our railway stations, factories, and warehouses usually are, can anyone say that engineers are incompetent to build them? Of course not. The architect must study construction, the very root of his calling; and the engineer must study art, and learn to ornament his construction, and the two will be found to be but one profession which never ought to have been divided, and which probably never would, had it not been for the great rush made in the early railway times, when in the fevered heat men did not pause to study appearances, but only thought of how to construct with safety, quickly, and cheaply. The true "chief constructor," whether you call him architect or engineer, must learn to do all this and something more: he must bring artistic power to bear upon his work and render it beautiful, or, at least, pleasing to the eye. I do not propose to attempt anything like a detailed explanation of the various clauses of the Draft Bill. Indeed, so little time have I had at my disposal in which to prepare a few remarks by way of introducing the subject for your consideration and discussion, that I must necessarily content myself with advocating the general purpose of the Bill—viz., that of registering all at present in practice or duly qualified, and making it hereafter compulsory upon all who desire to practise as architects or civil engineers, that they should receive a proper professional training, and pass such test examination or examinations as may be deemed necessary by the General Council. I trust that all here who have not already done so will procure for themselves a copy of the Draft Bill, and carefully study its provisions, and then favour the committee over which I have the great honour of presiding with any remarks or suggestions which may occur to them. The Bill, as drafted, is based mainly on the Medical Acts and others of a similar character, such as the Act to amend the laws relating to Attorneys, Solicitors, &c., 1860, the Pharmacy Act, 1868, the Dentists' Act, 1878, the Veterinary Surgeons' Act, 1881, the Law Agents (Scotland) Act, 1873, &c. Those who desire to thoroughly study this most important subject, should obtain and carefully consider these Acts. We have received much valuable help and advice in our labours from Mr. Ed. Trimmer, the energetic secretary of the Royal College of Surgeons, and from various officers of the Society of Medical Officers of Health. It would be impossible to over-estimate the benefit such advice as theirs has been to us. The Medical Acts are so very similar to what we require, that no better model could have been found, and we have this advantage—that we are able to base our draft on their latest Act, which contains all those requirements and improvements which have been found, from actual experience, needed. That the public desire to see such a reform of the profession as I am advocating has been amply evidenced by articles and letters in the *Times*, *Morning Post*, *Standard*, *Daily Telegraph*, and other papers; and in the monthly magazine or review entitled *Time*, a valuable and very carefully-written leader appeared a short time ago. That our profession is in favour of such legislation may be seen from the following few figures. A circular was issued some months ago to 2,500 architects, with the following form of declaration f signature:—

"Whereas we, the undersigned, are of opini that it is for the benefit of the public and t architectural professions alike that legislati powers should be obtained, so that all perso hereafter entering the profession shall be du qualified by examination, we are desiro that committees should be formed to promo the object in view, and to obtain the necessa Act of Parliament."

Of these 2,500 circulars, 1,500 were sent architects not being members of the Roy Institute of British Architects, and over 1,1 were returned signed in favour. Of 1,000 se to members of the Institute about 180 replied i favour, but of this number some 20 withdre on receipt of a circular from the Institut pointing out, what was very well known b fore, that the movement did not emanate fro that body. Had it done so, I have very litt hesitation in stating my belief to be that 9 out of the 1,000 would have declared themselv in favour. Of course, the 20 who withdre agree to the principle, but think the Institu the proper body to move—and in this I perfectl agree with them; but the Institute does n take action, and, after all, it is the measure w care for, not the men who carry it out. Pe haps I am not strictly correct in saying t Institute has taken no action, for in May las at one of their open conferences, papers we read upon the subject, and a resolution i favour of such legislation was only defeat by the casting vote of the chairman, and a amendment substituted and carried that t subject be referred to a committee to consid and report upon. Whether anything furth has been done I know not. One of the cor monest objections I hear urged against t registration of all at present in practice is th we shall be obliged to include many who qualifications, to say the least, are of a lo order, and whom, perhaps, some would rath not recognise; yet other bodies have had to the like. We cannot attempt to exclu any who are making a living by their prof sion, and so long as they act honourably, the names must appear on the register. There surely no hardship in this? At the present ti their names appear in the Post Office directori and on brass plates. Existing societies are n in any way interfered with, and they can be exclusive as they like. They can admit membership only those who have proved t their works their title to the highest honou or they can admit only those who have be in practice some specified number of year but until all are united in such a manner compulsory registration makes it possible, t status of the profession can never be raised the dignified position it ought to occupy. T register, instead of placing all on an equali as some seem to fear, will do the very opposit for it will give the various titles and distin tions of those who are entered in it. Thus o may be simply registered as an architect, su veyor, or civil engineer, whilst another ma appear as a Fellow of his Institute, Membe of Council, Gold Medallist, Fellow of t Society of Antiquaries, Master of Arts, & Another objection taken is this. It is said b some that the Act will not benefit the publi because it will not prevent jerry builde putting up badly-constructed and insanitar dwellings. It is true we do not attempt for moment any such drastic measure, which coul only end in the utter defeat of our objec What we have to do is to teach the public tha it is an advantage to employ a qualifie architect, and we shall never succeed in th until we compel all to become properly qual fied. Indirectly the Act will undoubtedly ha a very important effect in ridding us of t jerry builder's fever dens. After the passing the Act no unregistered person will be allowe to take or use the name or title of architec civil engineer, or surveyor, nor to hold an public appointment. The result will be this that all town and borough surveyors, &c., wil like medical officers of health, be proper qualified practitioners, and I will not enlarg upon the importance of this further than point out the enormous advantage it will be t the public to have such a staff of skilled officer whose interest it will be to see that work properly carried out and that the building law and regulations of their respective localities a made such as they should be. The Act w

thus give the public an efficient staff of officers whose duty it will be to protect them from the evils of insanitary and badly constructed dwellings, and this without cost. We all know how thoroughly and conscientiously medical officers of health carry out their duties, and I venture to think that they will find the registered architects and surveyors of the future their best and staunchest allies. Those who doubt that the legislation we are seeking will do any good either to ourselves or the public, must, if they be consistent, say that we could afford to throw over the protection and benefits of the Medical Acts, and throw open such important offices as those held by medical officers of health to chemist's assistants, nay, even to their shopboys, or, in fact, to any one with impudence enough to undertake such appointments for the minimum payment. This, for want of organisation and State recognition, is what is happening daily in our own profession, and we constantly read of builders' clerks, inspectors of nuisances, and others of far less knowledge, or no knowledge at all of building, undertaking the office of parish surveyor, a post which, of course, should be filled by a properly qualified practitioner. The task we have undertaken is no light one, but all can help us by advocating the cause whenever an opportunity presents itself. Hitherto the committee have borne the expense themselves, with some aid given by the Society of Architects, but to carry our labours to a successful issue further aid is needed. How best to raise the requisite funds is a matter occupying the serious attention of the committee; but if all who take an interest in the passing of the Act were to give a small subscription—and it need be only a small one—this difficulty would be speedily overcome. Another plan which I have sometimes thought might be adopted would be for the committee to open a provisional register of all those who would be qualified under the Act, charging a small fee for registration. This is a matter which probably may be discussed presently. I cannot conclude these brief remarks without impressing upon all the importance of doing their utmost to strengthen the existing professional societies, and agitating within them the need of the proposed legislation. Your own society here might probably be largely increased if every member made up his mind to introduce another within the present session. Those who prefer joining the Royal Institute of British Architects may render good service to the cause, as every vote we can get there in our favour is of consequence to us, and I am sure I need not tell you that those who like to join the Society of Architects will meet with a hearty welcome. In all or any of these ways you will be helping forward a cause which I trust you are all sympathisers with.

The Chairman, in opening the discussion, said he knew that the Royal Institute of Architects did not look very favourably upon the proposed Bill, and it seemed to him a very strange thing that there should be any opposition to it; it seemed so self-evident that there should be an examination for architects. If the examinations were compulsory, students would be compelled to work up to the required qualification, and that would not only have a beneficial effect upon their future life, but it would also be greatly to the advantage of the public generally. Some persons said builders were more practical than architects; if it were so in any instance it ought not to be allowed to continue, for architects ought in all cases to be able to teach the builders.

Mr. E. Farman, London, hon. sec. of the Society, gave a sketch of the movement that had led to the Bill being drawn up for submission to Parliament. What was wanted was a compulsory examination. That society did not wish in any way to interfere with the Charter of the Institute of Architects, or with that of any other society. All they desired was that there should be a general council like the General Medical Council, which should have supervision over the examination, and should represent architects from all parts of the United Kingdom, each district having its own representatives on the council. In the Bill proposed they did not want to take away the power of the Royal Institute; they were willing that the Institute should be the examining body, but they desired that the general council should have the supervision of the examination, and be able to step in should the examination be made too easy.

Mr. W. J. Moscrop (Darlington) said as a non-society man he thanked the society for the trouble they had taken in preparing the Bill. He thought they had done a great work, and forced the question forward at least 25 years. He congratulated the society on their having proposed that the Institute of Architects should be the examining body. He had never been able to make up his mind that it was desirable to include engineers, and surveyors, and architects in one Bill. He thought that as time went on the distinction between these branches would be more clearly marked than at present, for although it might be policy to include them all in the Bill at present yet difficulties would arise in future. If the ranks of the profession could not be closed by the Bill proposed, he should like their opponents to say how they would do it. By the proposed Bill they would stop the "quacks"; if they could not prevent them practising altogether they would prevent them holding public appointments or recovering fees in courts of law.

Mr. A. Pollard, of York, thought that although there might at first be some little unpleasantness connected with the working of the Act, yet the profession would derive benefit from it afterwards. If registration became a matter of fact, youths on leaving technical schools would be better qualified when they left school than many were now on leaving the architect's office.

Mr. W. G. Penty, York, said that they were much indebted to the Society of Architects for the great efforts made in drafting the Bill, and everybody, he thought, must be impressed by the very disinterested way in which they had framed the various provisions. Although they were opposed by the Royal Institute of Architects, they had not tried to take from them the power they possessed, and which they ought to have exercised. The great question was, Was the Bill desirable? He thought there could only be one opinion on that matter, and therefore the next thing for them to do was to consider the best way of obtaining the Bill and protecting the profession. He referred to the fact that assistants according to the Draft Bill were required to have acted as such for eight years before they could commence business as architects. He thought the term might be reduced, and he pointed out that the effect of compulsory examinations would be to make articled clerks apply themselves more diligently to the profession. He thought builders would have no cause to grumble about the Bill. They would not lose work. Architects did not profess to become builders, and therefore would not interfere with them.

The discussion was continued by Mr. Jeffry (Kent), Mr. Benson (York), and Mr. Burleigh (York); and Mr. Gough replied.

On Tuesday, the members of the Society visited Beverley and Hull, where they inspected the chief buildings, including the Minster and St. Mary's Church at Beverley, and at Hull—where Mr. Robert Clamp, A.R.I.B.A., acted as guide—the parish church of Holy Trinity, the Dock Offices, Town Hall, and Market Hall. In the evening, a meeting was held in the Church Institute, York, when Mr. Edgar Farman occupied the chair.

YORKSHIRE ARCHITECTURAL ART.

Mr. W. Hepper, president of the York Architectural Association, read a paper on "Yorkshire Architectural Art." He said in selecting the place in which to hold the visit of the society he thought it would have been impossible to have chosen one more suitable than the county of Yorkshire, or a more important place than the ancient city of York. What county existed that abounded with more works of architectural art than Yorkshire, or what city or town was there in which Mediæval remains were of a more interesting character and historical value than were found in the ancient city of York? Yorkshire was almost the foremost of all counties in every branch of Mediæval art. It was replete with monuments of the most magnificent character; it was full of the remains of as magnificent abbeys, churches, and estates as England could boast of, all of which charmed the eye of the traveller, found employment and enjoyment for the antiquary, and endless food for the architectural student. In the city of York* alone, within a stone's throw of each other, were old churches, abbey, cathedral, manor-house, bar walls, half-timbered houses, and other works, all of which counted among the glories of Yorkshire. Foremost among the Mediæval works of which the county could boast were its cathedrals, of which there were three—York, Beverley, and Ripon, and foremost of these, not only in Yorkshire but Great Britain, was the noble and glorious Minster,† the finest of all English cathedrals. There might be studied Mediæval architecture in all its phases; the Norman in the crypt, with its massive moulded pillars and carved capitals, all in the most excellent preservation; the Early English in the transepts, one of which had so ably been restored by the late Mr. Street; the unique Five Sisters' window; the Decorated style in the chapter-house, with its delicate carving, and in the elegant proportioned nave famed for its west window with heart-shaped tracery; its magnificent western towers, shorn of their beauty by the Parliamentarians, who took away and destroyed most of the carved figures figures with which it was adorned. The splendid western front, the glory of the cathedral, had been compared to Rheims for richness, sublimity, and beauty of architectural design. Lastly, the Perpendicular style was to be found in the upper portion of the west towers and in the grand choir, with its nine-light east window, one of the largest windows in the world, filled with stained glass, and representing all the subjects of the Creation. Here from a gallery which crossed the window a magnificent view of the whole cathedral was obtained, and the visitors could not but feel the wonderful skill shown by their ancestors in designing and carrying out such a glorious work. He would not close his remarks about the Minster without mentioning the beautiful oak reredos designed by Mr. Street, and decorated by Mr. Bodley, which now adorns the altar. The stained glass also was unusually perfect and ancient, and although there were some windows by Peckett in the 18th century, there were very few of the tasteless productions of the earlier part of this century. Second to York was Beverley Minster,‡ which they had that day visited. In the 17th century, civil war and pestilence, bringing ruin upon the inhabitants of Beverley, nearly brought the Minster to the verge of ruin. It was, however, repaired in 1717 in the Debased taste of that period; but fortunately a more tasteful restoration at the commencement of this century restored the building to more nearly its pristine glory. The eastern portion of the building, including the transepts, is mostly in the Early English style, except a later insertion of an east window, made in manifest imitation of the east end of York Cathedral. The nave was Early Decorated with Geometrical windows and flying buttresses, the ornate north porch and the west façade were in the Early Perpendicular style. The interior of the Minster was a grand field for the student of Gothic, in all its styles, commencing with the plain pointed lancets. Ripon Cathedral§ had been restored by Sir Gilbert Scott within recent years. During the early part of this century a new roof and ceiling was placed over its nave, the choir groined and the windows repaired. The western façade of the cathedral is one of the best specimens of Early English architecture in the kingdom. On the north side is the transept in Transitional Norman work, adjoining the Perpendicular nave. The choir is partly Decorated, but a portion of the original clerestory remains. The interior of the North transept demanded attention, as presenting a continuous and elaborate specimen of Transitional Norman. Beneath the centre tower, after travelling along a narrow passage 45ft. in length, is the far-famed crypt called "St. Wilfred's Needle," the purpose of which seemed to have been for retirement

* See various sketches in city in the Building News for Feb. 12, 1875.

† The following illustrations of York Minster have appeared in the Building News:—Archbishop Gray's Monument, June 5, 1874, Aug. 18, 1876, and May 9, 1884; Archbishop Grenefield's tomb, Sept. 7, 1883; archbishop's palace, April 4, 1884.

‡ Measured drawings of the north-east transept, by H Downs, were published in the Building News for July 18, 1884; the altar, &c., Feb. 22, 1883.

and penance. In the choir was to be found a harmonious admixture of three styles, and also a remarkable arrangement of two tiers of windows, which was obtained by glazing the traceried apertures of the triforium. The chapter-house and vestry are attached to the south aisle of the choir, under which was a crypt of Early Norman work. Next in importance to the cathedrals must rank the ruins of the numerous ancient abbeys and priories, which abound in this country. In York they could boast of the celebrated ruins of St. Mary's Abbey.* In sketching the history of this abbey, Mr. Hepper said that in 1088 William II., finding the monastery which then existed too small, laid the foundation of another with his own hand. At the Dissolution the abbey was retained by the Crown, yet it shared the fate of religious houses in England at that period. What chiefly tended to the speedy overthrow of the Church and conventual buildings was the order issued by the Crown to erect on the site a palace of the Lords Presidents of the North. The monastic buildings furnished abundant material for the stately edifice. When it ceased to be used as a palace a large portion of its walls, which had gradually fallen into decay, were granted in 1701 to the magnates of the county to be employed in building the gaol, and afterwards to other places. For instance, in 1707, the Corporation of Beverley were allowed to carry away during the space of three years as much stone as might be required for the repair of Beverley Minster. A kiln was erected upon the site to burn lime, and thus perished one of the finest of the English Abbeys, the ruins of which now remaining are protected by the Yorkshire Philosophical Society. Sufficient, however, remained to show the extreme beauty of its architecture. In 1132 certain of the Benedictine monks of the Abbey of St. Mary's, at York, disgusted with the relaxation of discipline there displayed, determined to migrate to a place where monastic manners were practised with more severity, and determined to embrace the rules of the Cistercian monks. They went and founded the Abbey of Fountains†, four miles from Ripon, in the splendid grounds of Studley, and no ruin in Yorkshire was better known or more visited than that. Art and nature alike had striven to adorn that delightful valley with their choicest treasures. The building, when complete, covered twelve acres of ground, but the ruins now remaining occupied only two acres. The refectory was remarkable for its beautiful proportions and simple and graceful architecture. The gloomy vaults and the cloisters form a double arcade 300ft. in length; in fact, Fountains Abbey became one of the wealthiest monasteries in the kingdom. In reviewing the habits of the monks who lived in the old abbeys, Mr. Hepper said those who lived in Fountains Abbey were of the Cistercian order, and nearly all the abbeys of the order were dedicated to St. Mary. The whitewash on the walls was their only decoration. The glass was generally plain, and never more richly ornamental than with grisaille patterns. The abbeys of this order were very numerous—Yorkshire: Fountains, Kirkstall‡, Rievaulx, Kirkham§, Roche, Jervaulx, Byland, and Bolton, all belonging to it. Mount Grace Priory was the most complete ruin extant belonging to the Carthusian monks. One peculiarity of this order was that the monks had a house each with a garden to himself. The houses formed three sides of a large inclosure, the fourth being formed by the church and prior's residence. The cells, which were two stories high, were in fair preservation, and the curious hatchway, through which food was given to the monks, was plainly seen. There was a small church and large cloister. Each monk had a living room, with bedroom and storerooms—a narrow stair 2ft. wide led to another room, the use of which was not clearly known. The priory was about eight miles from Northallerton, and was founded in the fourteenth century. There are only nine Carthusian houses in England. The buildings were long, narrow, and aisleless, for, like the stern Præmonstratensian Canons, the Carthusians wanted no congregations, and cared for no processions. Of the abbeys belonging to the Præmonstratensian orders were those of Easby* and Egglestone. Among the Augustinian abbeys were Bolton† and Bridlington priories. The choir of Bolton Priory shows some beautiful work of the Norman period, with circular interlacing arcading all round. The upper part is in the Decorated style, with tracery windows. The nave has been restored by Mr. Street, and is now used as a parochial church. Around the church are a good many conventual buildings, and the prior's dwelling. The gate house remains in entirety, and with various additions forms a shooting box of the Duke of Devonshire. On the walls of the lower story are some curious frescoes, the work of monks, and represent deities and devices, but it was only when the glory of Medieval architecture was declining that the heathen emblems came into favour. Bridlington Priory was founded in the reign of Henry I. After a brief reference to Whitby Abbey,‡ Mr. Hepper proceeded to speak of Kirkham Abbey and the Abbey of Byland. The last named, he said, was the ruins of a beautiful Cistercian monastery, perhaps once the finest in England. He then referred to the collegiate and abbey churches. Among those which had been converted to parochial use he noticed the churches of Selby, Howden, and Nun Monkton. The parish church of Selby, he said, was the glory of that town. Having during recent years been restored by Sir Gilbert Scott, it now presents one of the finest examples of a conventual church to be found in England. The central tower fell in 1690, destroying the south end of the transept. It was replaced by a small erection in the Debased style. Rich Norman work beautifies the nave, showing its different gradations from Early Norman to Transition. The choir is an example of Decorated work in its best period. The east window of seven lights is a notable example of flowing tracery. St. Peter's, Howden, stands unique among churches of its own individualities. It is neither cathedral nor parish church, and yet it has something of both in its composition. In the days of Edward the Confessor it was connected with the Benedictine Abbey of Peterborough. Until 1267 it was a parish church with a rector, but it then became collegiate. The west front is exceedingly fine, and a centre tower rises 135ft. At Nun Monkton Priory are no remains of any importance, except the church, which is a gem of Early English architecture. It was restored and reroofed by Mr. Crawhill, of Nun Monkton. The porch is fine Transitional Norman. He next referred to the parochial churches of Yorkshire, first noticing those of the City of York—Castlegate, Coney-street; All Saints', Pavement; and St. Michael-le-Belfry—as generally representing the Perpendicular style. Of these, St. Mary's, Castlegate, with its elegant spire, was restored a few years ago by Mr. Butterfield. All Saints', Pavement, was originally a Decorated church, but very little of that now remains, and it is noted for its fine lantern tower. The churches of St. Margaret and St. Dennis are noted for their fine Norman doorways; St. Mary's, Bishophill, junior, for its supposed Saxon tower. Holy Trinity, Micklegate, was originally a priory church of great beauty; nothing remains, however, of the old church except the nave arcade and some ruins of one bay of the triforium and clerestory, and of the western doorway. Among the numerous parish churches with which this county abounds, one of the most noteworthy was that of Doncaster, which was burnt down during this century, and entirely rebuilt by Sir Gilbert Scott. It was originally a Perpendicular church; but he rebuilt it in his favourite style of the Geometrical Decorated. After referring briefly to Thirsk, Northallerton, and Hemingbrough churches, Mr. Hepper proceeded to speak of some of the ancient castles in the county, including Tickhill, Conisbrough, Pontefract, Sendal, Cawood, Harewood, Knaresbro', York, Skipton, Scarborough and Middleham* Castles. Among examples of domestic architecture he would refer to Wentworth House and Castle Howard. Two miles from York was Heslington Hall, a fine example of the Elizabethan period. In York itself were many examples of domestic architecture. The Manor House and St. William's College were among the largest of these, the last-named being of the Perpendicular period, and a favourite haunt of the architectural sketcher. Having referred to the architectural features of the King's Manor House, he now reminded them of that magnificent example of Classic Architecture, the town hall, Leeds.

On Wednesday, the members of the Society visited Leeds, where they saw the Town Hall, Corn Exchange, Mechanics' Institute, and St. Peter's Church, and afterwards proceeded to the Cistercian Abbey of Kirkstall and Adel Church—the latter a Transitional Norman building, illustrated in our pages on May 20, 1870, and April 30, 1875, and in the evening a conversazione was given by the York Architectural Association at the Fine Arts Institute, York. Yesterday (Thursday), an excursion was made to Ripon Minster and Fountains Abbey, the evening meeting in York being devoted to a discussion on "Architects' Charges," opened by Mr. Edgar Farman. To-day (Friday), the programme includes visits to St. Mary's Abbey and York Minster, and closes in the evening with a discussion on "Yorkshire Building Stones."

† The house and vicarage at Bolton were illustrated in our issue of July 6, 1883.

‡ In the BUILDING NEWS for Oct. 29, 1869, was published a detailed account of the abbey, with perspective of interior of north transept, both by Mr. E. H. Smales. Sections of mouldings by the late Edmund Sharpe were given in our issue for Aug. 25, 1871; a view of east end of choir sketched by "W. C.," May 4, 1877; a drawing by Mr. Jas. Langham of exterior of north transept, June 28, 1878; and a series of measured drawings by Mr. A. P. Garston, July 2, 1880.

EDUCATION, CULTIVATION, AND EXAMINATION.†

THE subject upon which I am to address you to-night is Education, Cultivation, and Examination, and I cannot, I think, better open it than by quoting a striking observation of the present President of the Architectural Association. "A most important discovery has been made within the last few years," remarked Mr. Slater, "that is, that one necessity for an architect is a thorough education, and the results of this discovery must have very far-reaching effects on our profession." These words formed the close of the paper on "New Inventions and Discoveries," read last May before the Conference of Architects, and though there is a strong spice of humour in the introduction of them there, and as they stand, that humour only serves to make their truth the more forcible, and their truth the more pungent. The pleasantries of a wise man sometimes discover his weightiest thoughts, just as it is the jokes of a fool which first betray the emptiness of his head. I cannot hope to-night to throw any startling light on the subject of education for architectural students, or to say much that has not been well said already; but I hope I may be able to add my voice to those which are calling upon the rising generation of architects so to train themselves as to take the place in society to which our noble profession entitles them. And appearing here as Professor, and also as one of the Council of the Institute, I am not sorry to have an opportunity of saying a word upon the action of this College as an educating body, and that of the Institute of Architects as an examining body. I should like to add that as this subject is an extremely large one, I have limited myself to what I thought would be useful to the audience for whom this lecture is written—an audience of London students or intending students of architecture. The object of education is to equip the scholar for the part he has to play on the stage of the world. The modes of doing this are various, and they meet with infinitely varied success; but, broadly considered, their action may be divided into *teaching* and *training*. The first communicates knowledge, the second develops power; the first prepares a man for his work, the second fits him for his life. This distinction, as I have hinted, comes out from

* Illustrated in the BUILDING NEWS for Aug. 28, 1874.

† By Prof. T. ROGER SMITH, F.R.I.B.A. A public introductory lecture to the Classes in Architecture at University College, London, delivered on Wednesday night last, Oct. 5, 1887.

a broad review of the subject of education. It eludes us if we attempt anything resembling a microscopic analysis, but it is none the less real because the boundary line is not capable of being sharply drawn. There is, perhaps, no study which can be said to be exclusively valuable as conveying information, and to be powerless to influence character or to develop powers of mind, just as there is none which can be looked upon as solely a mental discipline, and of absolutely no value as an acquisition; and yet there can be no manner of doubt that a certain course of study will convey more information than training, while a different course will be of more use as discipline than as doctrine. For the most part, instruction is the obvious and often the sole apparent object; development is the less patent result, and apparently less intended. On the whole, the theory of education received among us has seemed to be that a schoolboy's training ought mainly to be directed to furnishing him with a series of almost indispensable acquirements, and any mental discipline which is gained in the process is so much thrown in, while he who continues his studies at college, or elsewhere, and takes his degree, does so chiefly, if not exclusively, for the purpose of developing the power and faculties of the mind. The first is often spoken of as education, the second as cultivation. I am not clear that this distinction between the two words is quite accurate; but it is a received one, and it was to indicate these two branches of the subject that I introduced both these terms into the title of this lecture. There are many occupations, and even some professions, in which a person of very moderate general education, if he knows his business thoroughly, and devotes himself to it exclusively, may run a very successful career, that is to say may do much useful work and make money. I do not think this has been to any extent true of architecture in the past, and I feel little hesitation in saying that it cannot be so in the future. In this metropolis, and in every great business centre there are scores of men to be found who, after a short and not very profitable course of schooling, were at an early age set down to the desk, or the counter, or the factory, who through long years toiled and worked till every detail of their occupation became as familiar to them as their meals or their clothes, and who by honesty, industry, and enterprise, aided by some favourable circumstances which they were able to turn to account, have attained competence, prosperity, fortune. Perhaps some of you have made the acquaintance of the butterman in "Our Boys," and you may take him as an illustration—though a caricatured one—of the man of limited education who becomes rich. He has little general knowledge, less cultivation, his range is very limited; but he has the shrewdness and knowledge of affairs that a busy life gives, and he possesses in perfection so much as he wants of acquaintance with his business—in vulgar English, he knows his trade, and nothing but his trade. There are some professions—even some high ones—especially those which can or must be pursued to a great extent in solitude, and which do not bring him who pursues them constantly or frequently into contact with his fellows—where it is possible for a man to rise even to the highest eminence, who yet is extremely limited in general knowledge or culture. Turner, the great landscape painter, and Paganini, the violinist, may be cited as examples of the most trancendant powers, but of very little general cultivation. This is not, however, necessarily the case with a great painter or a great musician, as may be proved by many examples of high cultivation in both professions. There are other callings where, from the nature of the work to be done and the circumstances under which it is performed, a considerable amount of general cultivation is almost essential to great success, and among these I am disposed to class architecture, while, independent of professional success, there can be no doubt that the man of varied information and carefully-trained powers will lead a far happier life, and have far more opportunities of being a useful and an influential member of society than the mere specialist, if he will only remember the rule that his profession must have the first place and his accomplishments be all kept subsidiary to it. There is a third object towards which at the present day teachers and scholars alike only too often all but exclusively direct their efforts. I need hardly say that I mean passing examitions. Properly speaking, an examination is intended as a test of education, or rather that is its theoretical function. Practically, at the present day the whole aim of a large part of that which we call education is to get men successfully through one exam. after another. This is a very great misfortune. Probably this evil will be corrected in time; but in the present generation the liability of examinations to abuse is a disadvantage which is possibly inevitable, and must be perhaps put up with, as the natural drawback or compensating disadvantage attendant upon the privilege of having been born into the most wonderful and advanced epoch that our country has yet known. I have great respect for an examination so conducted as to show whether a student who has been at work upon a subject with a view to knowing it has made proper use of his opportunities or no. I have some confidence in the serviceableness of examinations as a stimulus to the exertions of the indolent and the unsatisfactory scholar. An examination, of which the programme has been well devised, may be of great use in directing the attention of students to those collateral branches of knowledge which the experience of their seniors leads them to point out as desirable to know. But the pernicious influence of examinations pushed to excess (recognised both by students and teachers alike) is to be felt in all institutions from the elementary school up to this college. It substitutes the art of answering questions for the faculty of learning, and the practice of getting a superficial acquaintance with the facts of a subject likely to appear in the examination papers for the serious and complete study of the subject to which that paper relates. The difference between cramming for an examination and studying a subject is almost like that between an actor learning his part, and for a brief hour seeming the hero, the king, the lover, or the sage, which he is not, and the real king, lover, sage, and hero working out the drama of their actual lives on the world's stage. As matters stand, there is an absolute necessity for spoiling the work of many a young man's best years. He is to be a civil servant, a soldier, a doctor. He must pass certain examinations, and his best teachers are forced at any sacrifice to make sure work of his preparation for this ordeal, and must hope to be able in such scraps of time as can be spared to carry him in some of his subjects further than to the bare limit of the programme, and so to some extent to teach him more thoroughly than is requisite or indeed serviceable for this preparatory, I had almost said mercenary, end. Happily, there is as little about the examination for which architectural students in England are required to prepare themselves which will necessitate cramming in place of study, as there well can be in any examination where the examiners are entirely distinct from the teachers. I believe the fairest of all examinations are conducted by the teachers. I am, for example, able in the papers which I set for students in these classes at the end of each session to put such questions as will show whether they have made good use of their time here, and can do so better than a stranger not aware of what has been taught here, and what is passed by, could do. This, of course, is impracticable in the examination for Associateship of the Institute. It necessarily takes a variety of subjects which have to be variously learned, and has been so carefully devised with a view to fairness that it appears to me that it would be difficult for any student to have much chance of fitting himself for passing except as the result of a genuine acquaintance with the subjects, and not easy for an expert crammer to do much in the way of artfully enabling an incompetent man to answer a set of questions so as to deceive the examiners into passing him. On the other hand, I think no student who has honestly and for a sufficient time studied his subjects under proper guidance, need fear failure. To return to education and cultivation. Higher education, as you know, is sometimes carried on by the help of classical and literary studies, sometimes by scientific studies. I shall not even attempt to suggest which is best, but the results are sure to be different. A literary training brings the student into intimate relations with human thought and human ways, makes him large-minded, widens his scope, and fosters a taste for the literary side of human work. Literature—remarked Mr. John Morley in a recent address—"literature, the masterpiece of literature, furnishes the ideas which guide the conduct and mould the character, and it is upon conduct and character that the future of the nation will depend." Scientific training makes a man accurate, observant, acute; but it is not unlikely to narrow rather than broaden the scope of his mind. His attention is more directed to things than to thoughts; matter more than mind furnishes the subjects of his study; and the exactness of natural science will be reflected in his habits of thought. Let it not be forgotten, however, that this is the day of science—that an almost infinite possibility of work stands open before the man who is scientifically trained—and then even I, whose prejudices all lie the other way, must admit that for many, though not for all, a scientific education is the right thing. But man is a complex creature, and out of the many powers he possesses a good education should not confine itself to the cultivation of one group. Mathematics and modern languages, and now, to some extent, sciences are recognised as properly to be included in the scheme of a good classical education; nor, on the other hand, will the scientific teacher, though Greek and, perhaps, even Latin be denied his scholars, refuse modern languages, and that perhaps most interesting of language-studies—the thorough knowledge of our own tongue from its rise downwards. Self-culture is, however, of more immediate interest perhaps to hearers at the stage which I conclude most of my present audience have reached than scholastic or college courses; and I invite your consideration of these studies and accomplishments, which go to cultivate the mind or the taste, and which may be taken up after school or college has been left, or may be carried further at that stage in our career, even if they were begun at an earlier one. How can I best cultivate my own mind? is a question of the greatest possible importance to young men who find themselves to a greater extent than formerly their own masters with all the responsibility, as well as the pride and dignity of having the disposal of their own leisure, the selections of their own subjects and books, and the choice of their own pursuits. The exercises which more than any other will make raw schoolboys, or youthful collegians into cultivated men, are summed up by the most sagacious of all English writers on life and things in one of his immortal essays. Bacon, writing of studies, in his fiftieth essay says, "Reading maketh a full man, conference a ready man, and writing an exact man." "Reading maketh a full man" sure enough, and nothing is so great a help to the youth who wishes to improve his mind as a taste for reading. However reticent a man may be with his fellows about his work, his discoveries, or his views, when he becomes an author he always puts his whole heart into his book; and so we have ready to our hand on our shelves the very best thoughts of the most gifted thinkers, and the sum of the knowledge of the profoundest students. The best books are now accessible, cheap, plentiful; and for a few shillings a valuable library (even Sir John Lubbock's hundred best books) may be got together. I need not say that trash is plentiful also—and so is poison—and that it is of importance to read the right books, not to read the wrong ones, and to waste as little time over newspaper-reading as possible. I am disposed to press my objection to newspaper-reading a little. It is not that the contents of the newspapers are not often interesting and important, or that the articles are not well written. There is no fault to find with several of the best English journals on this head; but the habit of taking up a paper, skimming the headings, selecting a bit here and a bit there, reading hastily and fastidiously, and forgetting all about it the next day is so entirely opposed to everything that is studious or serious, that, especially if formed early in life, it to no small extent impairs a young man's, or any man's, power of reading steadily and well. When an habitual newspaper reader takes up a book that ought to be dealt with seriously, he is apt to treat it as he treats his journal; and I need

hardly point out that a valuable book dipped into is of not much more service to you than your dinner would be if you merely tasted it. Perhaps, too, it may be worth while to point out that the money spent on a penny paper daily would buy you a shilling volume every fortnight, or at the rate at which shilling volumes can be got, four every six weeks, quite as fast as even with a good deal of leisure you can read valuable books. I do not propose to offer much advice as to reading; but I will hazard one or two suggestions. First, I think few studious youths are the worse for mixing some poetry with more serious stuff, and even the better sort of fiction *in moderation;* secondly, if you have mastered any foreign language, you will be doing yourself a double service if you read a book in that language from time to time. You will keep up your French, German, or Italian, and you will gain the advantage (which is not inconsiderable) of reading a good book (for I presume the selection to be a good one) more slowly than one reads one's native tongue. Let me add here that for your professional training you will depend largely upon books. There are a certain number of textbooks which you ought to have at hand and refer to. There are a very few books, not textbooks, but books like Ruskin's "Seven Lamps," calculated to make you think, and there are books of illustrations, monographs, &c., which you should, from time to time, look through in the libraries. A very good selection of these is named in the little book issued by the Institute of Architects, and containing the programme of examination and advice to students. "Writing," says Bacon, "makes an exact man." Writing well is an accomplishment which does not, as a rule, come of itself, and the value of which, let me add, in our and, in fact, in every profession, can hardly be put too high. No better mode of learning to write is known to me than translation. Here the thoughts or narrative are provided, already expressed in language, and the exercise is to express them afresh and accurately in English, and so a command of words and of the correct use of them are gained. Accuracy is, I think, the most important quality of writing, and the most important result of the habit of writing. Simplicity and directness are of importance also, and possibly the habit of letter-writing may help to develop these. Writing the every-day occurrences of our life to some friend or relative, who will take an interest in what we write, but with whom we have no inducement to attempt fine writing, or laboured composition, is a simple, but often a serviceable, training in the use of the pen; and another practice, useful in itself, as well as in teaching the use of the pen, is the habit of writing abstracts of important books or chapters of books. "Conference," again says Bacon, "Conference maketh a ready man." This includes, with conversation, those more formal opportunities of speaking and discussing which are afforded by the many discussion societies, classes, and similar assemblies which exist. The classes of the Architectural Association and the meetings of that body are, to architectural students, a good means of what Bacon calls "conference," and that readiness which they beget will be found in after life extremely useful. The discussion of materials, construction, planning, &c., which often goes on among clerks and pupils, is another part of the same engagement; and let me add a word to point out the immense advantage to those who engage in it of the almost disused art of conversation. Talking always will go on; but conversational powers are rare, and even good, sensible conversation on topics of interest, without any claim to brilliancy, is rare. If you have the opportunity of talking over your work, your studies, your difficulties, and so forth with any well-informed friend who can talk, and who knows a little more than you yourself do, it is not time lost. I lately heard a successful engineer, addressing the members of a students' engineering society, urge them strongly to keep up the discussions and speak at them for the sake of practice in speaking. "It is not enough," said he, "that you should make yourselves competent to carry out engineering work; it is also essential to your success that you should be able to convince those persons of your competence for whom such work has to be done, and nothing will better enable you to do that than the practice of discussion in societies such as this"—advice quite as good for architects as for engineers, and which I therefore beg to press on you, gentlemen. In addition to the influence in forming character, of the pursuits just considered, there are certain other studies and pursuits which are of the greatest service in self-culture. Modern languages for example. A really thorough knowledge of French, German, or Italian, or, better still, of two or all three of those languages, besides its value as an exercise of memory and judgment, opens opportunities of conversation with foreigners in their own country, and gives the command of a new literature. Of course, in many businesses this attainment is an advantage. In some it is essential; but apart from that and as cultivation, I think modern languages and literature claim a very high place. Next to these I would put the practice of some of the fine arts. Nature has denied a musical ear to some and a painter's eye to others, and these she means should cultivate some other side of their character. But those who can draw or paint, or model, or who can sing or play with pleasure to themselves, and some fair amount of success, are many, and for such the study and practice of this or that art is a means of cultivation of the highest importance. With practice should go the understanding of whatever art is pursued, a man who can draw and paint, but has no ideas about or knowledge of paintings, has reaped no more than half the benefit which he ought to have received from the fine arts. Of pursuits, one of the most cultivating, if I may employ the word in an unusual sense, no doubt is travel. No greater boon has been bestowed upon the young men of the present day, among all their advantages, than the means of visiting every corner of our native land, without cost for transit, on the rapid and independent tricycle and bicycle. Travelling in all its varieties, from the shortest Saturday to Monday trip, to the tour round the Globe, has done more to enlarge the notions of modern English folk than any other, among the many changes in the habits of life which we have made. Of course, there is travelling and travelling, and one person will get more good from it than another; but hardly anyone can well fail to be the better for a journey. This first trip on the Continent is an era never to be forgotten in the life of a young man, and so far as I have observed, travelling is one of the few recreations which seems to retain the power to charm old as well as young. It is not, however, as a pleasure, but as a profitable employment of time and money, that I introduce travelling here, and I do so in the firm conviction that as a means of cultivation it has hardly any equal. Lastly, all the social accomplishments which tend to make a person acceptable in the company of others are parts of cultivation which in a highly-civilised community like ours ought not to be overlooked. To be able to dance, shoot, ride, play tennis are all of them aptitudes worth acquiring. I fear I can hardly say so much of athletic pursuits. I have the strongest admiration for cricket, football, Volunteering, and such occupations. They refresh the mind and invigorate the body; but I do not notice that the pursuit of them has much of a civilising effect on the ways and manners of British youth.

(To be continued.)

PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN.

On Monday last the annual exhibition of this useful Society opened at 5A, Pall Mall East with a display of much interest. Naturally the studies of architecture and old buildings furnish the chief attraction to us, though we most thoroughly appreciate the landscapes and character pictures as specimens of photographic art. The portraits, too, are generally well chosen in this collection, and in some cases for finish and artistic character rise considerably above mere personal interest. Space fails to permit of any detailed notice of these prints. We may note, however, the exceptionally large bromide enlargement by the Eastman Dry Plate and Film Co., No. 366; also the life-size direct portraits by Messrs. W. J. Byrne and Co., to whom a medal has been awarded. We consider Mr. F. W. Edwards' platinotype reproduction of an old engraving, in which the colour of the original is exactly imitated in the development, to be a clever piece of work, even though it may not claim to be specially original; and we admire very much the photographic enamels vitrified on "cuper or gold plates" by Messrs. Benque and Co., of Paris. The portraits on red and pink grounds are particularly decorative, and the miniatures by the same process are exceedingly good. Among the photographs of special interest beyond the exact merit of the photographs themselves we were attracted with a series printed by the Autotype Company, of tree houses and other scenes in illustration of picturesque New Guinea, from negatives by Mr. J. W. Lindt, R.A. The natives and their houses, shown just as they are in all the primitive simplicity of their naked barbarism, afford many a novel detail and much instruction. Messrs. Henry Dixon and Sons, Mr. Vernon Heath, and Mr. H. P. Robinson are, as usual, well represented with highly meritorious examples of their most finished productions. Before passing on to the views of architecture, we must for a moment stop to note Mr. J. Gale's splendid work under the titles of "Too Wet for the Woods To-day," "A North Country Doorway," "Oat Cutting in Sussex," "Sleepy Hollow," and, above all, "Saturday Afternoon," in which the light and shade seems so adroitly managed, the figures so skilfully posed, and the group so well photographed. The platinotypes, by Mr. H. Collis Pettitt, from Helvellyn, Derwentwater, Windermere, and Borrowdale, well deserve the medal they have won; and Mr. J. C. Andreæ's views from Rye, Falmouth, and Pullborough do their author great credit, as do the scenes from "David Garrick," taken by ordinary gaslight by Mr. J. F. Roberts, to whom a medal is awarded.

Eaton Hall furnishes the rich subject for several studies by Mr. G. Watmough Webster, of Chester, who also shows a large platinotype of a chimney-piece elaborated with a figure-sculptured frieze, and constructional overmantel, massively treated and finished. Another similar set of even greater interest is supplied by Mr. Richard Keene's Interior of Hardwick Hall, which, in their way, are quite perfect, showing the most exquisite manipulation and execution on the part of the operator. "The Release of Barabbas," is one of Mr. George Tinworth's most successful panels in terra-cotta; and Mr. Edwards sends a fine photograph in illustration of it (39). St. Mary's Church, Banbury, has of late years been cleverly decorated in colour, rendering the interior both church-like and in harmony with its uses. Mr. George Mold exhibits two photographs here which show the building very truthfully, and give a correct rendering of the edifice. Mr. S. H. R. Salmon contributes a group of studies of City churches, and Mr. W. Cobb some instantaneous views of London thoroughfares, while Mr. William England shows other scenes in our streets taken from a tricycle. Of all the instantaneous photographs exhibited on the present occasion, we like those showing the elephants performing at "Olympia" before the Queen, by Mr. G. P. Cartland, who takes the medal for them (17). We conclude by praising the enlarged print of St. Paul's Cathedral, from a negative by Mr. J. Bracebridge Hilditch. "Flamma Vestalis," by Mr. Fred Hollyer, is a photograph of great merit, after a picture by Mr. E. Burne-Jones, A.R.A.; and Messrs. Luke Fildes, W. J. Yeames, J. Pettie and P. R. Morris, Sir Frederick Leighton, and Mr. J. B. Burgess are among the members of the Royal Academy whose work is also represented. Of other painters of note, there are photographs of works by Mr. Holman Hunt and Mr. Walter Crane.

A new Wesleyan chapel in Hinde-street, Manchester-square, W., built at a cost of £16,000, was opened on Wednesday week. Mr. James Weir, of Victoria-street, Westminster, is the architect, and Mr. Holloway, of Clapham, the builder. The style is Classic, and the chapel has a tower rising to a height of 100ft. Sitting accommodation is provided for 800 persons, and at the rear of the building is a church house.

The town council of Warrington have decided to mark the site formerly occupied by a house of Austin Friars, in that town, by a bronze tablet, and the tender of the Coalbrookdale Iron Co. has been accepted for carrying out the work.

OUR LITHOGRAPHIC ILLUSTRATIONS.

PLAS MAWR, CONWAY.

PLAS MAWR, in the town of Conway, is a very perfect specimen of Elizabethan architecture, having escaped the alterations usually attending an occupation of three centuries, mainly owing to the fact that it passed by marriage, early in the 18th century, into the Mostyn family, who, having many other seats, did not reside, and after a time let it out to a number of tenants, who found its preservation and exhibition to tourists a source of profit. It has now found more worthy tenants in the Royal Cambrian Academy of Arts. The views we publish are from drawings by Messrs. Arthur and Herbert Baker, the architects to the Academy, who are about to issue a work containing measured drawings and views of the house, with details of the plaster ceilings and wall decorations, which are very curious, and a full description of the house and of the families of its former owners, and their pedigrees. The issue of the work has been considerably delayed owing to the amount of research required to identify the armorial bearings on the walls, but the authors hope very shortly to complete their work. Applications for the work, which will be published at a subscription of £1, may be made to Mr. Arthur Baker, 14, Warwick-gardens, Kensington.

THE McARTHUR HALL, BELFAST.

THE plans for this building were submitted to Mr. Waterhouse, who selected the successful design out of 12 sets. The conditions of competition were that the cost of the work was not to exceed £10,000, and the building was to accommodate 60 young ladies (daughters of Wesleyan clergymen). Sir William McArthur, K.C.M.G., Lord Mayor of London in 1880, and M.P. for Lambeth for many years, generously gives the money, or the greater part of it. The building will be larger than shown in the competition drawings, and will be erected in the grounds of the Wesleyan College at Belfast. The architects are Messrs. T. N. Deane and Son, of Dublin.

AN ITALIAN RENAISSANCE CABINET.

THIS is a cabinet of picked Riga oak inlaid with walnut wood, and richly carved, by Messrs. Trapnell and Gane, 39, College-green, Bristol. The centre portion consists of an upper open compartment or arcade inclosed with square columns, and panelled at the back with an inlay of walnut wood and oak. The end compartments are also open. The front posts of which are supported by conventionalised lions, wrought into the structure. The back panelling of this portion is carved and inlaid. The central doors above and below, also the frieze, are elaborately carved and inlaid. Some brass grilles inclose the upper end doors. The other portions of the work are explained by the drawing itself; and in almost every detail this piece of furniture is of the highest finish. It is designed by Mr. Caleb Trapnell, the senior partner of the firm.

ALL SAINTS' CHURCH, GOSFORTH, NEWCASTLE-UPON-TYNE.

THIS church is built to supply the needs of a rapidly-increasing suburb of Newcastle. It was consecrated on the 2nd October by the Bishop of Newcastle. The tower is not yet built, and the internal fittings are only temporary. The design and character of the church are sufficiently shown by the lithographs, which are from drawings exhibited in the Royal Academy in 1886. Mr. Robert J. Johnson, F.S.A., of Newcastle, is the architect.

A TOWN HOUSE.

THE illustration under the above title is from a design for a house in a main thoroughfare, the aim of the design being to obtain as great a contrast of light and shade as possible under the circumstances. The dining-room is on the ground floor in front, the morning room behind. The drawing-room takes up the whole of the front on the first floor, the deep recesses on either side form balconies accessible from it, which would give air without being exposed, the space between forming a deep bay to the drawing-room. The library is on the same floor behind, bedrooms on the floors above, kitchens in basement. The bay window at the side lights the staircase. The drawing from which the illustration was taken was exhibited in the Royal Academy this year.—FRANK E. LITTLER.

PROPOSED STAIRCASE AND HALL, RUFFORD HALL.

THIS drawing now illustrated is a view in the present autumn exhibition at Liverpool. It shows some new work, from the designs of Messrs. Hornblower and Son, architects, proposed to be carried out in Rufford Hall, long the seat of Sir T. G. Hesketh, Bart., and his family. The mansion was built about 1798, and is in the Grecian style of architecture. Formerly the estate belonged to the Fyttons, and was brought into the Hesketh family by the marriage of Maud Fytton with Sir William Heskayte, in 1310. In the park is Rufford Old Hall, the well-known Elizabethan half-timber house, with wood and plaster panels, some of which are carved. The banquet hall was a handsome open-timbered roof, with carved angels supporting shields. The detached screens are exceptionally rich, and are movable.

ECCLESIASTICAL ART EXHIBITION AT WOLVERHAMPTON.

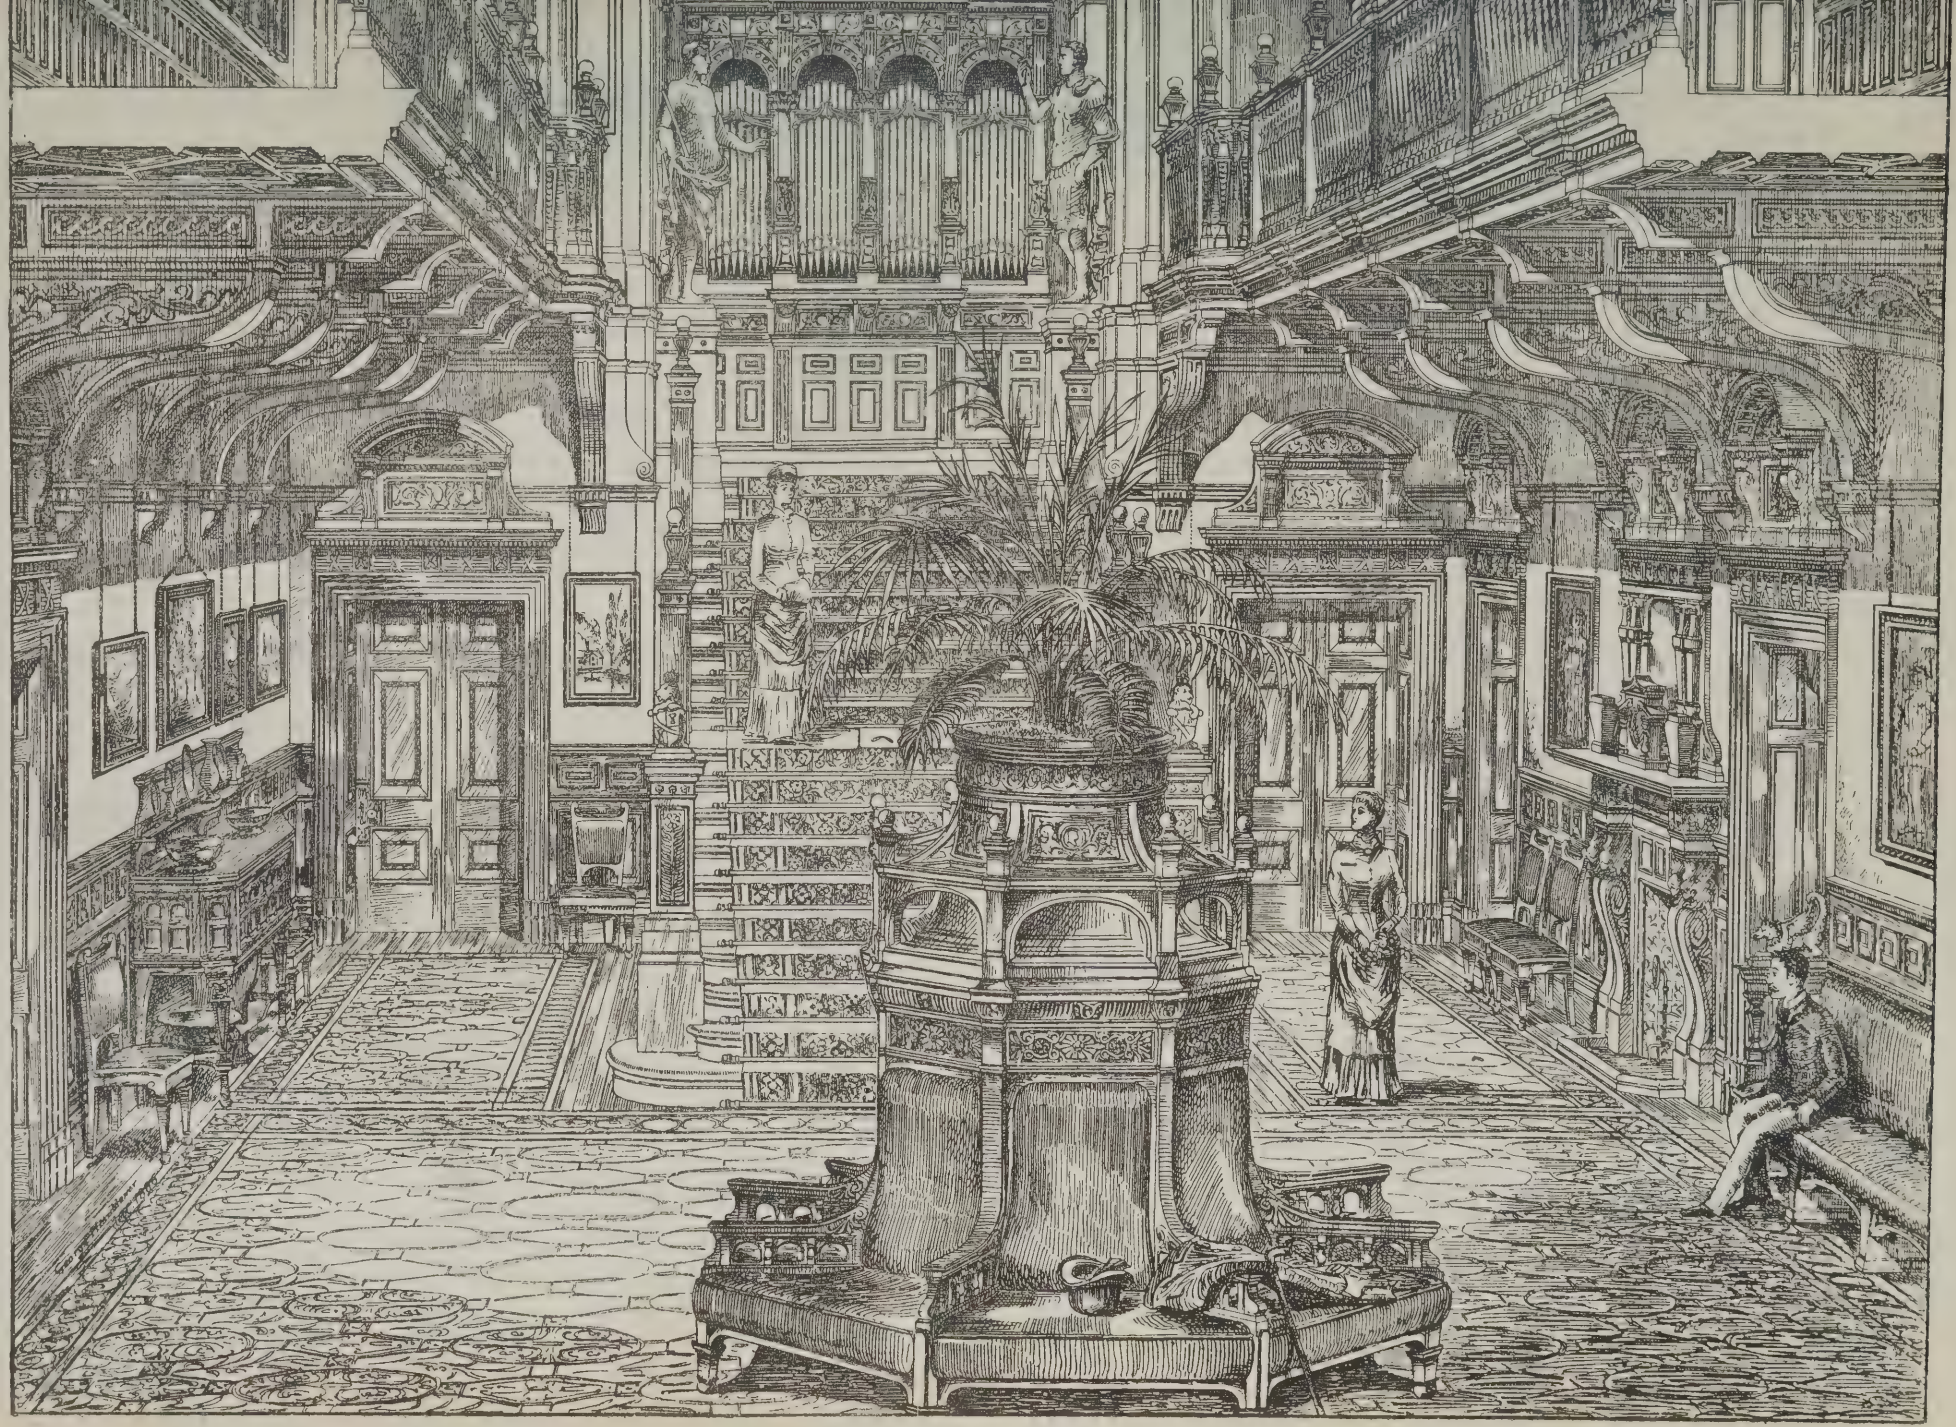
IN connection with the Church Congress which is being held at Wolverhampton this week, a collection illustrative of the arts as applied to ecclesiastical purposes is on view at the School of Art. This is the ninth of these ecclesiastical art exhibitions, and in many respects is far ahead of its predecessors, and, thanks to the large number of loans and trade exhibits offered, the committee have been enabled to keep more nearly than before to the original idea of the promoters. The loan exhibits include a large number of Persian and other Oriental fabrics, recently collected in Kashan and Teheran, and lent by Mr. Cecil Harcourt Smith; as typical specimens in this collection may be mentioned the boghebehs, or "patchwork" of silk embroidery and brocade, sumptuously executed in the richest materials. The Rev. W. Nigel W. Gresley, rector of Dursley, lends four cases, containing some 400 relics from Piedmont, and attested as to authenticity by a Cardinal-Archbishop's seal; also numerous memorials, crucifixes, and embroidery. Messrs. Doulton and Co., of Lambeth, exhibit four terracotta panels, and photographs of others, by George Tinworth, many of which have been illustrated in our pages; the East Grinstead School of Embroidery show many specimens of their work, and numerous rubbings in brass are contributed by Mr. H. E. Franks, of Willesden; while from the South Kensington Museum are sent about a score of photographs of church plate in the collection of the department. Among the general exhibitors are Messrs. Jones and Willis, of Birmingham and Bloomsbury, who exhibit numerous and excellent examples of their productions in ecclesiastical metal-work, wood and stone carving and embroidery, all executed by their own workmen and upon their own premises. Messrs. W. B. Simpson and Sons, 100, St. Martin's-lane, W.C., show their revival of the ancient art of enamelling on copper in conjunction with their patent system of sectional jointing, affording a novel adjunct of rich character for decorative art purposes. The discovery consists in dividing the design into sections like those of stained glass, where the pieces of glass follow the contours of the objects, the junction running along well-defined outlines, so as not to disturb the general design. Another improvement in Messrs. Simpson's process is the shallow modelling of the forms by working in *repoussé*. By this process, patented by Messrs. Simpson three years since, it is possible to produce much larger works in enamel than formerly. Messrs. West and Collier, of Hambledon, Henley-on-Thames, have on view their church chairs, and Messrs. John Smith and Sons, of Derby, show a large turret clock and other church clocks. Stained glass and cartoons are exhibited by Messrs. A. O. Heeming and Co., of Margaret-street, Oxford-street, W., and examples of art metal-work by Messrs. Benham and Froud, of Chandos-street, W.C. Messrs. Maw and Co. show an altar-piece of the Crucifixion intended for Grosmont Church, near Whitby, also lustre ware, and tiles.

SOCIETY OF ENGINEERS.

THE Society of Engineers had its first meeting for the session 1887-8 on Monday evening, October 3rd, at the Town Hall, Westminster, Professor H. Robinson, president, in the chair, when a paper was read on "Stability of Factory Chimneys," by Mr. R. J. Hutton.

The author entered fully into the theory of stability of tall chimneys, pointing out some errors in the formulæ ordinarily used, and, in connection with stability, considered the relative effects of wind pressure on various forms, as circular, octagonal, and square, and at various angles. He then showed that the section of chimney which combined the highest theoretical stability with the least amount of material was not the same as that required by practical considerations for its greatest efficiency in producing draught, and that a compromise had to be effected between the two forms. Some examples of successful chimneys were then given, and also of some that had failed, with an examination of the causes of failure.

COMPETITIONS.



MAYNOOTH.—An important competition is now taking place among half a dozen architects in Ireland for the completion of St. Patrick's College Chapel at Maynooth. The college was built by Pugin about forty years ago, and the chapel was erected in carcase from the designs of Mr. J. J. McCarthy at a cost of £26,000 about ten years since. It has from then remained unfinished, and the work now proposed is for the completion of the building with stalls, altars, and other fittings, together with the decorations of the vaulted roofs. The designs were sent in last Saturday. The competitors are Messrs. Charles McCarthy, T. J. O'Calloghan, Wm. Byrne, Wm. Hague, J. L. Robinson, A.R.H.A., and Messrs. Geo. C. Ashlin and Gotché, all of Dublin.

Roman remains have been discovered on Tockington Court Farm, near Bristol. Excavations have revealed the foundations of a Roman villa, consisting of five rooms and a portico, with tesselated pavements, the largest piece of the latter being 50ft. by 10ft. without a break, and all in a remarkably fine state of preservation. The farm is rich in Roman remains, many relics having been discovered there.

At the annual general meeting of the Association of Public Sanitary Inspectors held at Westminster Town Hall on Saturday, October 1st, Mr. Hugh Alexander, chief sanitary inspector, Shoreditch, was unanimously elected chairman of the council, vice Mr. G. B. Jerram, C.E.

At Glasgow Exhibition next year it is proposed to make a representative display of sculpture executed during the Queen's reign, on the plan so successfully adopted this year at Manchester with regard to paintings.

PROPOSED STAIRCASE AND HALL, RUFFORD HALL.—Messrs. Hornblower and Son, *Architects*.

WAYSIDE NOTES.

I LEARN from my very good friend, Mr. "Chips," that a further sum of money has been granted by the French Government for the restoration of old St. Pierre, at Caen. Alas! and alack-a-day! the marks of the harsh-handed restorer are but too plainly evident at Caen already. Such restoration, too! I wonder where the destroyers will recommence at St. Pierre? On the elegant spire, the exquisite north portal of Flamboyant times, or the hybrid Renaissance stuff in the apsidal chapels? If I remember rightly, the spire and tower are both rendered sleek, so I fear the charming north doorway is doomed. Such a little gem, too!

French restorers, like new brooms, generally sweep clean. "Neck or nothing" would seem to be the motto of all disciples of Viollet-le-Duc. Was there, for instance, ever such a dreadfully hard piece of restoration as the present west front of St. Ouen, at Rouen? But such work is moderate by the side of that of the present-day official engineer-like restorers. It is all very good of the Minister des Beaux Arts to be liberal in his grants to the old churches; but the kindness is misplaced when the work is badly done.

There has, I see, recently been an interesting ceremony at Worcester in connection with the restoration of the College Hall, formerly the refectory of the monastery, which, with the crypt, exhibits work of the 12th and 14th centuries. The town must have had quite a gala day when the bishop and the Mayor and Corporation opened the hall.

In the West of England, too, I notice they have unearthed a Roman villa, or what remains of one. At a farm called "Tockington Court," near Bristol, "five rooms and a portico, with tesselated pavements," in a fine state of preservation, have been discovered. The "tesselated pavement" I take to be a piece of old Roman mosaic. It is reported to be about 50ft. by 10ft. in area, and is without a break, and of good design and harmonious colouring.

The action of the French Government in deciding to complete the purchase of the Celtic remains at Carnac, near the south-west coast of Brittany, is to be highly commended. But are we going to have another specimen of the unfeeling restoration-work of the French authorities? Will they "provide and fix" any new monoliths of granite that may be required to make good the old plan? It is to be hoped not. One would prefer to see the venerable stones propped up with balks of timber, and tied together, if necessary, with copper bands. They would then appear like aged men, resting upon their helpful crutches, and not be enamelled back to a spurious youthfulness.

One of my notes must have gone astray last week. I had intended to have remarked that there was a good deal that was interesting in the drawing of Birtley Church, reproduced on the 23rd ult. The church had, it will be remembered, a tiny chancel arch. But as there was no scale appended, it was impossible to judge of its size. Would Mr. Plummer kindly give us the dimension? Many of the readers of the "B. N." would be very glad of the information.

The most ardent defenders of the church of St. Mary-le-Strand may well feel their hearts sink within them when they hear that the residents and ratepayers of the parish of St. Mary have petitioned the Board of Works to sweep away the fabric. *Et tu Brute!* might well be the cry of anguish of the old building. When the persons nearest to the church conspire for its annihilation, the beginning of the end may be expected. I understand, however, that the Metropolitan Board of Works will probably instruct their clerk on Friday to reply that they do not propose to take any action in the matter.

What shall we say about the Middleton competition? My idea is that if any young architect took the advice of the ancient "Goth" of some weeks back, and inquired into the most desirable manner of arranging the internal economy of free libraries, he had better enter the struggle. It will, at any rate, afford him good practice. The experience, too, will be very *apropos*.

I note that the failures in the Building Trades up till the 1st of October of the present year are ten in number. It is very probable that the sum total of bankrupt architects and builders will be greater this year than either of the preceding ones. In 1885 there were twelve failures, and last year only eight.

Fires in theatres, and how to prevent them, is still a topic, and occupies the attention of the newspaper letter-writer. We have had some excellent ideas all round, but want more. Everyone should make some suggestion, if they have any, and if they haven't they should beg, borrow, or steal somebody else's, and peg away with that. Rather loose morals this, it is true; but I excuse myself on the Jesuit principle, as we sadly want a little concentrated energy to make hay while the sun shines, and help to prevent the recurrence of more fearful holocausts. Good is already resulting from the Exeter disaster. One hears of greater activity on the part of magistrates and others on all sides. Out of the tears of the mourning people of the Devonian city future generations will reap much benefit.

The result of the inquiry into the disaster at the Opéra Comique at Paris was less cheerful for those persons concerned than was that of the Exeter affair. Several persons in connection with the theatre were convicted. It was rather curious that a *fireman* should be among the number.

The fever epidemic continues, in spite of the meeting of the Sanitary Institute, and the efforts of the Asylums Board — the *so-called* epidemic, that is to say. Query: Is there any epidemic of scarlet fever? I am told it is simply a case of demand and supply.

I note that there has been a renewance of earthquaking in the South of Europe. This time it is Greece that is favoured, and one feels quite anxious and concerned about the Parthenon and other treasures there.

A few days back I was conversing with a friend who was at Nice during the whole time of the continued earthquake at that beautiful town. I am given to understand that Nice is practically rebuilt, and that the disastrous nature of the earth tremors there was never known by any but those who have sojourned at the town ever since the disaster. I am told that the authorities and townsfolk did their utmost to "hush up" the matter, and so endeavour to lessen the evil effect on the persons who live by the large number of visitors. To prevent the "season" from being a failure, the greatest ingenuity was displayed. Any wholesale rebuilding and repairing must almost have been prohibited by those in power. As an instance, I am told that the houses built on the sea front at Nice were greatly injured. But there was no rush to put them to rights. One scaffolding was erected before one building, and when it had been repaired it was moved on to another, and not before. Thus to the casual observer it would appear that there was but one house or so injured in the whole front.

If such was indeed the case, it is difficult to see how anything but an edict of the town authorities could have prevented a wholesale rebuilding of slightly injured houses. There is a little discrepancy in these two facts—the "practical rebuilding" and the slowness of the works—that hardly bears investigation. If the houses were repaired so slowly they could scarcely have been completed by this time—that is, if there were so many to do. Anyhow, it is said that the earthquake was a greater affair than is generally supposed, and that the inconvenience to townsfolk and residents alike, was in no wise exaggerated in the accounts of the London papers.

GOTH.

The hall of the Worshipful Company of Sadlers has just been reopened, after being redecorated, and the reconstruction of the sanitary arrangements. The latter work, including the provision of a new lavatory, was carried out by Messrs. Jennings, of Stangate, Lambeth.

STUDIES IN THE HISTORY OF ART.

THE first of a series of twelve lectures on "Studies in the History of Art" in connection with the University Extension Scheme was given in the Art Gallery, Exeter, on Wednesday week, by Mr. Ernest Radford, LL.D., Trinity Hall, Cambridge. Sir Thomas Acland, the chairman, remarked in his introductory observations that, so far from the subject of the lecture being a narrow or technical one, it was wide, deep, human, and of very general application. If they tried to arrange a library beginning with books on the most spiritual subjects, the records of revelation, and passing through all human subjects till they came to the most physical, hard, and material, the very elements of earth, they would find it rather difficult to settle the place in the series for books of art. Art was still exercised on human material. True art administered to comfort, to beauty, and to human interest; but it rose higher, to an ideal, and there came in contact with poetry, music, and literature. We could not benefit by the great work of artists unless we considered the time in which they lived. Here art derived light from history, and, what was more important, it also threw light on history. He would now go one step further to show that art was connected with religion; but this, perhaps, was outside the University course. He would venture to utter a word of caution. Philip Pusey, eldest brother of Dr. Pusey, who was among the first to promote schools of design in conjunction with Mr. Dyce, R.A., said we must beware of speaking of the refinement of art as a moral principle. It might be so, but it might have the opposite tendency by ministering to sensuous indulgence and luxury. Let his young friends beware of thinking that art was mere imitation. Imitation there must be, but that was absolutely subordinate to the higher work of the mind and heart. Selection, suggestion, omission, subordination of each part to the unity of the whole, these were essential and were not tricks of art. In conclusion, Sir Thomas quoted the following passage from Ruskin's "Two Paths:"—"There are two characters in which all greatness of art consists. First, the earnest and intense seizing of natural facts; then the ordering of those facts by strength of human intellect so as to make them for all who look upon them to the utmost serviceable, memorable, and beautiful, and thus great art is nothing less than a type of strong and noble life."—Mr. Radford, after alluding to the language and styles of the modern art critic, said they all wished to be art critics, but not of the modern kind. They must first ask themselves what was meant by education, and then they would understand the word critic in a somewhat larger sense. If he gave his idea of an educated man he should say that he was not a man that knew everything, but a man whose faculties were so trained and who so kept his mind and his heart open that he was ready to receive knowledge through whatever channel it came. This fact had been realised by the Universities, and consequently it came to be considered that art was of the same importance as literature, and almost of as much as history was. Art, he contended, was of itself a department of history. History, looked at from this point, was no longer a dull subject, but it became a profusely illustrated picture-book. He believed that the record of art was more faithful than the record of history, as the latter found its shape in the printed book, for they must look on it as if the arts of all time had been preparing the illustrations. In order to be educated people we study art, and we study art in order to become critics. The function of criticism was two-fold; it was to discern the direction of fault and the quality of achievement. The true criticism was that which sought for some signs of dignity and effort, but that of the modern critic was that which looked for the dismal and crude parts of the artist's efforts. What was desired was that they should be able to become familiar with the conditions of the time in which the artist lived, so as to enable them, as it were, to place their minds inside his mind, to work behind his hand, and to strive, as he strove, to achieve the desire of his heart, and follow him through every difficulty and triumph of his craft. To learn to appreciate effort required at least a cultured mind. There was some cultivation of mind that did not belong to the ordinary

erson, especially those who visited the English icture galleries and walked through the miles f galleries on the Continent. The gallery ystem was prejudicial to the artist himself ad his integrity, and was the subject of small onversation to the public at large. Now, what as the primary sense of pleasure in art? he pleasure in art was based simply and solely n recognition. The business of an educated an was to expand the area of recognition, and o to train his mind that he might be able to ecognise the resemblance in any form over the idest area. They must cultivate this pleasure o recognise any noble effort, and not only to onsider how far that effort was dignified, but ow far it had been successful. After pointing ut the distinction between criticism and con-ossieurship, he went on to say that he had een frequently asked if he believed in the cience of art. After giving the matter con-deration he had come to the conclusion that ere might be two sciences of art in the odern sense of that word. The first was the ience of æsthetics in the true and proper nse of the word, the science of the law of the nse of perception. If they could find that ertain effects of pleasure arose from certain auses they might get a sense of art production. fter stating several other views on the uestion, the lecturer went on to give defini-ons of art, concluding with that of William orris, "Art is the expression of man's delight labour."

SCHOOLS OF ART.

Hanley.—The annual meeting in connec-on with the Hanley School was held on Thurs-ay in last week, when Viscount Wolseley distri-uted the prizes, and in the course of his ldress observed that, in the case of all great eoples, they were in the highest vigour and osition when their art and literature flourished ost. The true function of art was to elevate ankind. Mr. Cartledge, the head master, in is report, stated that the school continued to aintain a high state of efficiency. The total umber of students during the year was 334, owing a decrease of 18. The average attend-nce had been better than in any previous year. he awards of the Science and Art Department eached the high total of 187, including the art aster's certificate, master in training scholar-ip, gold medal, silver medal, and eight free holarships. The report of the science classes ated that the number of students had been , with a percentage of 42 first-class and 42 cond-class passes.

St. Helens, Lancashire.—The annual dis-ibution of prizes to the successful students of e St. Helens Science and Art Classes took ace in the Town Hall, St. Helens, on Monday. he report of the committee showed that uring the year the number of candidates ex-nined at the St. Helens centre was 366, of hom 256 passed, four in honours and 55 in the dvanced stage, in which ten Queen's prizes ere given; 199 passed in the elementary age, 58 securing first class certificates in that age. The successes this year were not only ore numerous, but they were also higher in ality than those of the previous year. Sixty-x prizes had been awarded by the Central ommittee. The silver medal, awarded by the mmittee to the most successful candidate at e Government examinations had been varded to Henry Bickerstaffe, who had taken st-class certificates in five subjects.

CHIPS.

A new organ, built by Mr. Isaac Abbott, of eds, was dedicated on Michaelmas Day, at St. ichael's Church, Headingley, Leeds.

A fresco, having as its subject the "Crucifixion," s been placed on the wall over the chancel arch St. Michael's and All Angels' Church, Maid-ne. It has been executed by Messrs. Heaton, tler, and Bayne, of Garrick-street, by their new rmanent process.

The parish church of Upper Poppleton having come dilapidated, it is proposed to build a new ne edifice on a fresh site, the present building ing left. Messrs. Fisher and Hepper, of York, e the architects.

Mr. Edwin A. Bernays, M.Inst.C.E., late superin-ding civil engineer at Her Majesty's Dockyard, atham, died on the 27th ult., at Worthing, aged years.

Engineering Notes.

Glenfarg Railway.—The new Cowden-beath and Glenfarg Railway, the contract for which was recently obtained by Messrs. Charles Brand and Son, Buchan-street, Glasgow, is now in process of construction. The object of the railway is to shorten the distance between Edinburgh and the North of Scotland by way of the Forth Bridge, and the new line will be finished simultaneously with the Forth Bridge, in the spring of 1890. The line is divided into two sections. The southern section is three miles in length, and extends from the Cowden-beath Station on the Dunfermline line to Keltie Station, where it joins the Kinross-shire Rail-way. In this section about 300,000 cubic yards will have to be excavated, and several road bridges will be necessary. The second section commences at Mawcarse Station, on the Fife and Kinross line, and extends to the Bridge of Earn, where it joins the North British Railway. This section, which is ten miles long, runs through the wild and picturesque pass of the Ochils known as Glenfarg, and obviates a de-tour by Ladybank and Newburgh. From Maw-carse to Damhead—where the only station on the route is to be erected—the line will rise with a gradient of 1 in 100, and from Damhead to the Bridge of Earn there is a declining gra-dient of 1 in 75. The cuttings in this portion of the line are extremely difficult, and embrace about 800,000 cubic yards, more than half of which is through solid Whinstone rock. There are to be two tunnels of 500 yards each in length, two viaducts, and a number of bridges. The first of the viaducts will pass over the diversion of the Farg water, and will consist of five arches, with a span of about 60ft., and the second is to cross the Roden stream, near Kil-knockiebank, and will also consist of five arches, the span of which will be 40ft. The amount of the contract entered into by Messrs. Brand is slightly over £210,000; but the sum fixed by the North British Railway for the completion of the new scheme, which includes the doubling of the line from Keltie to Maw-carse (the contract for which has not been let yet), is £432,870.

Ribble Dock Works, Preston.—The Pres-ton town council held a meeting on Michaelmas Day to consider the proposal to apply to Par-liament next Session for power to borrow another £510,000, to complete the Ribble works, on which half a million has already been spent, under the direction first of Mr. E. Garlick, and latterly of his former partner and successor, Mr. Sykes. Mr. Walker is the contractor. Alderman Edelston proposed an amendment to defer the application until the opinion of some river engineer was obtained as to the sufficiency of the estimates of Mr. Sykes, the engineer to the scheme. He said he thought at least two million pounds would have to be spent upon the works. After a long debate the motion to seek Parliamentary powers was carried by 37 to 10. In his report read at the meeting, Mr. Sykes said:—"I am substituting sodding for the top portion of the pitching of the south slope of the river diversion, and dispensing with the hard rock on the south slope opposite the proposed shipbuilding yards. I also pro-pose to carry up the pitching on the north slope in front of the shipbuilding yards to about 10ft. high instead of to the top of the slope. These reductions will cause a consider-able saving."

Scarborough, Bridlington, and West Riding Junction Railway.—Operations are about to be commenced for the construction of the first section of the Scarborough, Bridling-ton, and West Riding Junction Railway, between Market Weighton and Driffield. Although only 14 miles in length, the first section will reduce the distance from Leeds to Bridlington from 82 to 63 miles—a saving of 19 miles. The second section of the line, from Driffield to Seamer Junction, will create a direct route from Hull to Scarborough, and will effect a saving of about 11 miles. At present, however, it is only intended to construct the first section. Messrs. John Fraser and Sons, of Leeds, are the engi-neers. Commencing by a junction with the branches of the North-Eastern Railway at Market Weighton, the line will proceed in an almost straight line north-east to Driffield. It presents no great engineering difficulties, and is to be completed within two years from the date of the commencement of the works. There will be four stations—at Londesborough, Mid-dleton-on-the-Wolds, Bainton, and Southburn. The railway company will have no terminal stations to construct; and are not required to provide rolling stock or engines. The capital required for this section of the line is £230,000. The contractor is Mr. Rigby, of London.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Newcastle Society of Antiquaries.—The monthly meeting of this Society was held on Monday night at the Old Castle. The Rev. Dr. J. C. Bruce presided. Mr. T. W. U. Robinson, of Hardwick Hall, exhibited several objects of great antiquarian value, which he himself had brought from Egypt, and which, not wishing to keep, he desired to present to the Society. Mr. Heslop presented a porcelain head, found at Corbridge. Mr. W. L. S. Charlton presented a piece of lead, found at Corbridge, which had been used by the Romans for the purpose of fastening the square stones of the bridge together. The Rev. Canon Franklin exhibited models of the Viking ship from Gokstad, now preserved in the Christiania Museum, and the church at Borgund, Norway. Explaining the models, he said that one of the most striking features of Norwegian life was the almost universal use of wood. Although stone abounded as in few other countries, wood was used as being warmer, cheaper, and more com-fortable. The church of Borgund* belonged to the oldest style of architecture in that country. It was of a dark colour, and a peculiar shape, and stood in the midst of a fair valley. The steeple was surmounted by a cock, and the shingled roofs were surmounted by dragons' heads and crosses. It was surrounded by a low-covered gallery, lit by open windows, and there were three doors for entrance and exit. The interior was small and very dark, lit only by a few small holes in the roof. The interior was covered with curious carvings. The roof was supported by ten wooden pillars. The gallery was occupied by the women, as was still the custom in the East. The old baptismal font was *in situ*. Like the Italian *campanili*, the bell tower was a separate building apart, for calling the worshippers to service. Two of these churches existed in Norway, dating from the same period. Though small and unecclesiastical in appearance, the Borgund church was built on true church lines, and stood east and west. Older than York Minster, it stood unimpaired by the hand of time, and, until a recent period, was the only church for miles round. With reference to the Viking ship, he said, this was found at Gokstad, in the south of Norway, in 1880. The vessel was of oak, and was clinker built, and the seams were caulked with a three-stranded cord made of cattle hair. The vessel was 80ft. long, 16ft. wide at her broadest part, and 4ft. deep from gunwale to keel. She was composed of keel, stem, and sternpost, with framed timbers, beams, and external planking. The framed timbers were lashed to the planking by willows made from the roots of trees. The ship must be deemed the masterpiece of its kind, and could not be surpassed by anything which the shipbuilding craft of the present day could produce. The following papers were also read:—"Note on an Inscribed Roman *Patera* of Bronze from South Shields," by Professor E. Huebner, in a letter to Mr. R. Blair, secretary; "The Gold-smiths' Company of Newcastle," by the Rev. J. R. Boyle; and "On a Roman Inscription at Cliburn," by Professor Huebner.

Mr. R. H. Wyrill, for many years borough surveyor of Swansea, has been promoted to the position of borough engineer, and will have charge of all new works, both as to water supply and sewerage works. Mr. Bell (the estate superin-tendent) has been appointed to carry out the duties of borough surveyor.

New board schools for infants in Roman-terrace, Swinton, Yorks, were reopened on Friday. Mr. A. Whitaker, of Swinton, was the contractor.

* Borgund Church was illustrated by a perspective and plan by Mr. G. Canning Richardson in the BUILDING NEWS for Feb. 9, 1877.

Building Intelligence.

Bristol.—A Workmen's Institute and Public Hall, St. Philip's, Bristol, is now in course of erection for the St. Philip's Coffee House Co. at Bristol. The building is of red brick, with purpose made or cut and rubbed dressings, the bay windows and projecting doorheads being executed in wood. The roof of turret is covered with plain tiles, the other roofs with double Roman tiles. A lift connects the bar with the kitchen on the second floor and the women's room between. This latter room is capable of division into two by a revolving shutter, and will serve as a committee room when the hall is used for public meetings. The hall has an open boarded roof, with wrought and chamfered principals, and provision is made for the future erection of a gallery, with seats for 100 people, the present accommodation being for 400. The rooms will be heated by hot water, and ventilation is provided for by flues in the walls and pneumatic ventilators. The cost of the building will be about £1,600, exclusive of site and fittings. The contractor is Mr. H. J. Rossitter. Messrs. Foster and La Trobe are the architects.

Belgrave, Leicester. — St. Michael's Church, Melton-road, in the suburb of Belgrave, Leicester, was consecrated on Thursday, the 22nd ult. The style is Early English, and the church is chiefly built of brick. As opened, it consists of a nave, 120ft. long by 35ft. wide, without aisles, and 50ft. in height and a chancel, with organ-chamber and vestry to north and south. Eventually transepts and a south morning chapel will be added, and a tower and spire built at the south-west angle of site. The west front is flanked by angle turrets, having spirelets and projecting buttresses, between which are three two-light windows, with a projecting gallery and pierced stone parapet over them. The church is seated for 600 persons. The floors in the passages are laid with durable tiles, in simple patterns, and in the choir and sacrarium the work is of richest design in Maw's encaustic tiles. On the fronts of the steps to the altar there are inscriptions. In the nave there are floors of solid wood blocks, upon which stand chairs. A font of stone and marble stands in a small baptistery in the centre of the west end. The work has been carried out by Mr. G. Hewitt, builder, Humberstone-gate, Leicester, and the duties of honorary clerk of works were undertaken by Mr. A. T. Draper, diocesan surveyor. The stone and wood carving is by Mr. Silvanus Wilmot, of Stoughton-street, Leicester. The architect is Mr. G. Vialls, A.R.I.B.A., of London and Ealing.

Birmingham.—By the erection of a new wing at the corner of Bull-street and Dalton-street, Mr. A. R. Dean has just completed a block of buildings with a frontage to Corporation-street, not long since erected, as a furniture and carpet depôt. The addition, which has been erected from the designs of Mr. J. Jenkins by Mr. J. Bowen, is in the same style as the original building, and has a turreted corner in Dalton-street corresponding with the one in Corporation-street. In the new section of the building a restaurant occupies three rooms. The basement will be used as a grill room, the ground floor as a dining room, and the room over it as a billiard room. The kitchen will be at the top of the building. Behind the restaurant in Dalton-street is an inclosed room for loading delivery waggons, and one for receiving goods. Above these, and approached from the street by an inclined plane, is a lofty stable with stalls for seven horses, a harness room, and corn room. This part of the building is fireproof, being constructed of brickwork and concrete. On the second-floor level new showrooms run over the restaurant premises, and over these are additional rooms for the manufacturing and finishing departments. The entire block of building has a frontage to Corporation-street of 136ft., to Bull-street of 70ft., and to Dalton-street of 140ft. Its height from basement to roof is 80ft.

Blackheath.—A new church for the English Presbyterian Congregation was opened on Wednesday, the 5th inst., at Vanbrugh Park, Blackheath. The building consists of a nave, transepts, lecture hall, classrooms, &c. The exterior is of Kentish rag and Bath stone, and the whole of the roof, pews, pulpit, reredos, &c., of selected pitch pine, and the outer doors of teak. The tower and spire at the angle of the building towards Mycenæ and Vanbrugh Park-roads is over 100ft. high. The site, an admirable one, was presented by Mr. Young, a member of the congregation. Mr. Thomas Arnold, M.R.I.B.A., of 10, Basinghall-street, E.C., was the architect, Mr. Jas. Morter, of Stratford, the contractor.

Blackburn.—A new Congregational chapel at Cherry Tree, near Blackburn, was opened on Oct. 2. The building is in the Decorated Gothic style of the early part of the 13th century, and is internally 50ft. long, 26ft. wide, 15ft. high to the square, and 32ft. to the apex of the roof. It is stone built with Yorkshire parpoints and red Runcorn stone dressings. The interior of the building is lined with bricks. The roof is formed with hammer-beam principals, is open to the apex, and has a boarded ceiling with ornamental embattled frieze, the whole being of pitch-pine and varnished. The windows are of lead, glazed with cathedral-tinted glass, and have iron ventilating casements; the glazing of each window is of a different pattern, specially designed by the architect for this building. The building has been carried out from the designs and under the personal supervision of Mr. James Bertwistle, F.S.I., M.S.A., architect, Blackburn. The names of the contractors, who are all of Blackburn, are as follows:—Mason, Mr. John Fecitt; bricksetter, Messrs. Charnley Bros.; joiners, Mr. Dugdale's carpenters, under the direction of Mr. David Critchley; slaters, Messrs. John Dyson and Son; gas pendants, ornamental brass railing, brass pulpit desk, locks and hinges, Messrs. Jones and Willis, Birmingham and London.

City.—The new City of London Court, which is about to be erected on land adjoining the Guildhall, near the Library, will take the form of a long line of buildings designed in a Late form of Gothic architecture, with cusp-headed windows richly moulded, having mullions and transomes. The style will harmonise with Sir Horace Jones's new wing to the municipal buildings. Mr. Murray, of the Guildhall, is the architect, and Mr. J. Mortar, of Forest-lane and Stratford, is the successful contractor for the work. The cost to the Corporation will be nearly £14,000. The offices are so contrived that when the lease of the property to the rear of the site falls in the courts will be extended, and with this idea in view the present buildings are to be constructed. The architect has promised us a drawing which will enable us to illustrate his work. The foundation stone will probably be laid some time next month.

Holme.—St. Mary's Church, Holme-next-Sea, was reopened on the 25th ult. The old-fashioned pews, which were painted in various colours, have been removed and new open benches substituted. Two plain but effectively designed prayer desks have been placed in the chancel, and a stone pulpit. There are also several minor alterations and additions, but further restoration is contemplated. The works have been carried out by Mr. Southgate, of Hunstanton (at a remarkably low figure), under the direction of Mr. Wm. Adams, architect, Lynn.

Manchester.—The headquarters for the 2nd Manchester Volunteers, situate on Ardwick-green, were opened by the Duke of Cambridge on Friday. The drill-hall is situated at the rear, and is lighted from the roof. It is approached from Ardwick-green through an archway 12ft. in width, and also through an ordinary doorway from the side passage. The front portion of the building, which serves as a screen to the drill-hall, contains on the ground floor men's room, sergeants' room, bar, main entrance, staff-sergeant's office, the staircase leading to the upper rooms, and the armoury. The commanding officer's room, adjutant's room, officers' room, committee-room, clothing store, and lavatory are on the first floor, and over them are the shooting-gallery, band-room, and a store-room in connection with it. The staff-sergeant's residential quarters are situate in the upper part of a tower. The drill-hall is paved with wooden blocks, and the other floors are formed of concrete on iron joists. The front of the building is faced with Yorkshire parpoints, and has freestone dressings. The style is Gothic, beginning with Norman boldly treated as a groundwork, and finishing with castellated parapets. There are open fireplaces in all the rooms in addition to a system of warming by hot water. Mr. Lawrence Booth, F.R.I.B.A., of Manchester, designed the building and superintended its erection; and Messrs. Robert Neill and Sons, of Manchester, were the contractors for the principal works.

Shrewsbury.—Holy Trinity Church, erected fifty years since at a cost of £2,000 for the accommodation of the residents in the suburbs of Belle Vue and Coleham, was reopened on Friday after reconstruction from plans by Messrs. Lloyd Oswell and Pountney Smith. The old church consisted of a nave of brick, 60ft. by 46ft., with a flat plaster ceiling, 24ft. high. At the west end was a small tower, with a staircase leading to a large gallery, and at the east end was a very small apse. A chancel, with aisles, was built in 1860, from plans by the late Mr. Pountney Smith, and this is the only portion of the old church now standing. The new nave is 87ft. long by 25ft. wide, and has north and south aisles 14ft. 6in. wide, with arcades of five spans and clerestory windows above. The roofs to the aisles are open framed; that to the nave being boarded to a waggon-head shape. The roofs are all of red deal, covered with Sedan green slates. The whole of the work has been carried out in brick, being faced, both inside and out, with Ruabon red pressed brick, relieved with dressings and bands of Grinshill stone. The arches of arcades are formed with an outer ring of brick and an inner ring of stone, the columns being Forest of Dean blue stone, with caps and bases of Grinshill stone. It is proposed hereafter to build a tower of brick and stone. The nave and aisles are seated with low-framed benches of pitch-pine, the choir-stalls are of oak, the flooring under the seats is laid with wood-blocks, and the passages and porches have been laid with plain red tiles in herring-bone pattern, and the encaustic paving of the chancel by Messrs. Minton, Hollins, and Co., of Stoke-on-Trent. A baptistery is formed by a semi-circular projection from the west wall of the nave. A general scheme of subjects for filling the windows of the church with painted glass has been prepared by Messrs. Heaton, Butler, and Bayne. Two of the windows in the aisle have already been filled in by them, and also the five lights in baptistery. The church will accommodate 822 people, being an increase of 340 sittings. The work has been executed by Mr. Richard Price, of Coleham. Mr. H. L. Whittingham was the clerk of works.

Sunderland.—The foundation-stone of the new municipal buildings was laid on Michaelmas Day. The style will be Italian Renaissance. The central feature will be the clock tower in Fawcett-street, over the main entrance. On the ground floor rooms have been provided for the engineer, accountant, and medical officer, and rate offices, the latter approached from Athenæum-street. On the first floor there will be a reception-room, art gallery, town clerk's offices, mayor's chamber, committee rooms, and council chamber. The upper floor will be devoted to a sanitary museum, school of art, and residence for caretakers. In the basement of the building provision has been made for polling booths during elections. Both the main fronts will be faced with Prudham stone, and the roofs are to be covered with green Westmoreland slates. There were 23 sets of plans sent to the Building Committee of the Corporation, and the design of Mr. Brightwen Binyon, of Ipswich, was selected by the referee, Mr. Alfred Waterhouse, of London. The total cost of the new building will amount to over £25,000. Messrs. E. H. and G. Allison, of Sunderland, are the contractors.

Westbury-sub-Mendip. — The restoration of the parish church, from plans by Mr. W. V. Gough, of Bristol, was reopened on Friday. The works now completed include the rebuilding of the north wall and tower, a new vestry and organ chamber, and new roof of oak to the chancel and deal to the nave and aisles. A few fragments only of the original roofs were discovered, the ancient chancel roof having entirely disappeared. These remains have, how-

ever, been copied in the new work. The interior has been cleared of the old seats, gallery, and a vestry which blocked up the side chapel, and new oak seats provided throughout the church. The windows have been reglazed with leaded glass, the eastern chancel window being filled with stained glass representing the Resurrection and Ascension. The floor space occupied by seats is laid with wood blocks, elsewhere with encaustic tiles. An anonymous donor has presented a reredos of Bath stone and marble. It is composed of five divisions, having in the centre a representation of the Agnus Dei, and on each side two panels with gilded backgrounds, containing carvings of the passion flower, lily, vine, and wheat. It has been executed by Mr. H. T. Margetson, of London, from the architect's design. The contract has been carried out by Messrs. W. H. Cowlin and Son. The lectern and other metal work was supplied by Messrs. J. W. Singer and Son, of Frome.

Worcester Cathedral.—After a course of restoration and repair, the ancient refectory of the monks, used in modern times as the King's school, was reopened on Monday. The repairs disclosed some interesting features in the old building which had been hidden for centuries behind plaster and colour-wash. The building was erected in 1372, is of red sandstone, 120ft. in length by 64ft. in breadth, and stands against the south cloister of the cathedral. It was found during the repairs that a window at each end—east and west—had been blocked up with brick and plaster. The west window (of which only the main framework existed) has been restored, with its tracery; as also has the east window, which much resembles one at Bolton Abbey. Beneath this window is a curious quatrefoil panel in the wall, which was discovered some years since; it had been obliterated by plaster, and is much defaced. The old timber roof is now hidden from sight by a groined timber ceiling, which greatly reduces the height of the room, pronounced one of the best in the kingdom for sound. Where the stones of the wall have decayed new work has been inserted. This is especially noticed in the fine Norman archway at the east end, giving entrance to the cloister, which has been in this way partially restored, and has at present a very patchy appearance. The cost has been £5,000, borne by the Ecclesiastical Commissioners, from plans by their architect, Mr. Ewan Christian, of Whitehall.

CHIPS.

A new organ, built by Messrs. Casson and Miller, of Perth, was opened on Friday in Penicuik parish church. It has a canopied front of pitch pine, with panels of oak and teak. Messrs. J. Ewart and Sons, of Penicuik, carried out the structural alterations to the church.

A reredos in Beer stone, and of 15th-century character, has been placed in Sompting Church, Sussex. Mr. R. S. Hyde, of Worthing, was the architect, and Mr. Harry Hems, of Exeter, the sculptor.

Memorial stones of a new Wesleyan chapel at Norton Down, near Midsomer Norton, were laid on Friday. Mr. Orlando Baker, M.S.A., Regent-street, New Swindon, is the architect, and Mr. W. A. Catley, of Midsomer Norton, the builder. The chapel is Gothic in style, built of local stone, and will seat 200 persons.

A new organ, built by Mr. J. J. Binns, of Bramley, near Leeds, was opened last week at Queen's-road Wesleyan Chapel, Hull.

In celebration of the centenary of the Masonic Girls' School, the governors are about to erect another wing to the institution at Battersea-rise at a cost of £30,000. The new buildings are to accommodate 75 children.

Mr. Frank Bagshaw, late of Nottingham, has been appointed assistant surveyor to the Corporation of Harrogate.

Messrs. Arthur Lee and Bros. have just completed a flight of marble steps, which have been placed in St. Mary's Church, Tyndall's Park, Bristol. The steps are wrought out of St. Silvester, a Portuguese marble. The prevailing columns are pink and white; the pink is of a coral tint, and the white is of semi-transparent appearance, the whole of the surface being interlaced with dark red and brown veins.

The new sewerage works at Henley-on-Thames, constructed on the Shone hydro-pneumatic system, will be publicly opened on Thursday in next week.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

Correspondence.

DRAIN TRAPS.

To the Editor of the Building News.

Sir,—The accompanying drawings of drain trap may be of interest to some of your readers.

SECTION.

PLAN.

The "black" section shows the trap with 6in. inlet and outlet. The depth of water in centre is 6¼in., and the passage below tongue 2½in. deep, and in the tail end of trap is an oblong inspection opening, as shown by plan and section.

Three traps of this description have been in use upwards of eighteen years on the drainage system of a dwelling house, and, although the passage below tongue is only 2½in. deep, the traps were always cleaned with the ordinary flushing allowance from w.c.'s and waste pipes. Unfortunately, the traps were not ventilated as shown on the section, but covered over with a stone.—I am, &c., A Clerk of Works.

LODGE FOR THE KING OF THE BELGIANS.

Sir,—*Re* this week's "Wayside Notes." The lodge that the King of the Belgians is about to build is a counterpart of the one at the entrance of Radnor Park, Folkestone, designed by Mr. Conquest, the Folkestone Borough Engineer, and built by Mr. Holdom.

The King saw the building in passing (it stands close to Radnor Park Station, S.E.R.), and wrote to ask the Mayor of Folkestone if he could forward plans and particulars, which was done by Mr. Conquest.

The materials were as far as possible local, and local materials are now being shipped by the Belgian Consul at Dover for the King.—I am, &c., One who Knows.

CHIPS.

During the past year an entire reconstruction has been in progress at the Calton Prison, Edinburgh, and except perhaps in one particular—the gate leading to the governor's house—the reconstruction has involved a distinct gain to the picturesque appearance of the castellated pile which figures so prominently on the south side of the Calton Hill. The work has cost the Government about £40,000, and is carried out in an ornate phase of the Scottish Baronial style, in harmony with the adjacent buildings.

The Corporation of Huddersfield have decided to adopt "Eclipse" glazing for their new wholesale markets, and the order has been placed with the patentees, Messrs. Mellowes and Darby, Church-street, Sheffield.

By the great fire which occurred in Stafford Market-place on Saturday, resulting in damage to the extent of £15,000, the finest old building in the town, and the chief characteristic of the market square, was destroyed. This was Elizabethan House, a splendid specimen of half-timbered work, three stories in height. It was erected about 1560, and was regarded as one of the finest examples of its class in Staffordshire.

The town Council of Hamilton have decided to seek Parliamentary powers to carry out a scheme of increased water supply from the Cadzow Burn, prepared by Mr. Gale, C.E. The estimated cost is £15,000.

A new national theatre is being built in Brussels. When completed it will be the largest and finest theatre in the country, and is to be named the Flemish Theatre. Considerable attention has been paid to the ventilation, Messrs. Robert Boyle and Sons' (of London) system being adopted; the extraction of the hot, vitiated air being effected by the latest improved air-pump ventilator.

A free public lecture, entitled "A Brief Retrospective Glance at the History of Artificial Heating," will be given by Mr. W. G. McMillan, at King's College, London, at 7 p.m. on Monday evening next, as an introduction to a course of lectures on "Fuels: their Use and Economy," to be delivered on Monday evenings, from 7 to 8 p.m.

A new church of St. Anne's, Cardiff, was opened on Wednesday by the Bishop of Llandaff. It is situated in Snipe-street, Roath, and has been built from a design by Mr. J. A. Reeve, architect, of London. It is in the Early English style.

A requisition has been made to the council of the Working Men's College, Great Ormond-street, Bloomsbury, numerously signed by clergymen of all denominations in South London, asking them to establish a branch of the college on the Surrey side of the Thames. A public meeting will be held a fortnight hence to give opportunity for ventilating the subject.

Plans and estimates for a permanent infectious diseases hospital in Hornsey were submitted at a meeting of the Hornsey Local Board last night, by Mr. T de Courcy Meade, the board's surveyor. A resolution was carried to the effect that the estimate to erect a permanent hospital in the best possible manner at a total cost of £3,240 (exclusive of the cost of site) be adopted, and the work carried out with the utmost despatch.

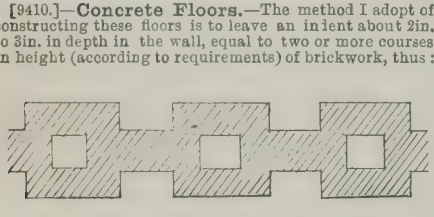
Intercommunication.

QUESTIONS.

[9418.]—**Ventilating Small Room.**—Will any of your practical correspondents kindly give me an opinion respecting the best mode of ventilating a rather small sitting-room, and oblige ?—J. MARSHALL.

[9419.]—**Waterworks.**—I should be glad if any reader experienced in waterworks will kindly give a sketch and explanation of an arrangement for ascertaining the height of water in a service reservoir visible from the outside of reservoir, and at a distance of about thirty yards? Also, I should like to know if, by only partially opening the sluice-valves on a water-main, the full pressure of the water is exerted on the pipes ?—CLARENCE.

[9420.]—**Church Seating.**—Could any of the readers of the "B. N." kindly let me know of any work on church seating ?—CHURCH.



[9421.]—**Proposed Public Buildings at Christiania.**—Could any one oblige me by information as to where one could obtain the particulars of proposed public buildings at Christiania ?—R. BLACKWELL.

[9422.]—**Measuring.**—I have some houses to measure up the whole of the trades which are completed, and I wish to know the proper course to follow in doing so. I am told by one surveyor to commence at the top of the building, and by another I am told to start at the bottom —*i.e.*, the foundations. Also, how to proceed during the erection of a building.—YOUNG SURVEYOR.

REPLIES.

[9381.]—**Extras.**—"Young Surveyor's" question is hardly explicit enough. He does not say whether there was a clause in the agreement binding the builder to complete by a certain date, subject to extras. In such a case the builder will be excused only in case the employer knew at the time of ordering extras that they were not consistent with the original terms, or that it was impossible to complete the work under the first contract until the extras were done. "Thornhill v. Neats," and "Legge v. Hancock" are cases in point. If an express agreement were entered into to the effect that extras were not to interfere with the time of completion, it can be enforced, even if the time given is unreasonable.—G. H. G.

[9410.]—**Concrete Floors.**—The method I adopt of constructing these floors is to leave an indent about 2in. to 3in. in depth in the wall, equal to two or more courses in height (according to requirements) of brickwork, thus :

the indent being represented by the portion hatched; this is better than oversailing. The best shape for the slab is a flat segment arch about 3in. thick at crown, and 10in. to 11in thick at walls (this latter, of course subject to width of span). If formed of good materials this may (when well set) be cut through the entire length, dividing it in two halves, and it will then carry any reasonable weight that can be placed upon it. The width stated is not excessive for this mode of construction.—JAMES THORNELOE.

[9412.]—**Eyesight.**—In reply to "Vedra," will he take the trouble to wash his eyes? When a pupil I suffered severely from prolonged work by gaslight, and found complete relief by regularly washing my eyes every morning in plain cold water. It will be a very unpleasant sensation, and somewhat painful the first time, much less the second, and none at all the third or fourth. For nearly forty years this has maintained my sight sharp and clear, though I have at last to use glasses. Put your face into the water and open your eyelids fully, look well round the basin, and blink freely so that the eyeball is truly washed.—E. C. P.

[9414.]—**Bird's-eye Perspective.**—The only difference in this kind of perspective is that the horizontal line, and therefore the point of sight and points of distances are raised considerably above the objects, so that if "Topsman" is "at home" with other perspectives, there is no difficulty to him. Consult Nicholson's "Principles of Perspective."—G. H. G.

[9415.]—**Mun. and San. Engineers' Exam.**—"Æolus" should read "A Practical Guide for Sanitary Inspectors," by F. R. Wilson, published by Knight and Co., price 4s. 6d.—MEM. ASSOC. SAN. ENGINEERS.

[9415.]—**Municipal and Sanitary Engineer's Exam.**—"Æolus" had better get Boulnois's "Mun. and San. Engineer's Handbook," and follow the course of studies given. After studying Latham and other works on Sewerage, the "Suggestions on Main Sewerage and Drainage," by Rawlinson, he had better study the provisions of the Public Health Act.—G. H. G.

A pastoral staff, for the Bishop of New Westminster, British Columbia, has been executed according to ancient examples of the 14th century. It consists of a gilt metal crook surmounting an ebony rod, which is divided into three portions by metal rings, and terminated by a metal tip or point. The length of the staff is about 6ft. The crook is foliated with the leaves and berries of the "Fruitful Vine." There is a chased knob under the "volute," which is set with "bossed" amethysts. The work is inclosed in a polished oak case, lined with violet velvet, and the whole was designed and hand-wrought by Messrs. Cox, Sons, Buckley, and Co., of London and New York.

LEGAL INTELLIGENCE.

IN RE CHARLES CHURCHILL.—The receiving order in this case was made on the 1st ult., the debtor being described as of Cross-street, Finsbury, importer of American machinery, trading as Charles Churchill and Co., and accounts have now been filed showing assets, £3,972 3s. 4d., and liabilities £15,213 16s. 10d., being a deficiency of £11,241 12s. 9d. The debtor, an importer of American tools and machinery, took over the business in 1880 on the death of his father, with whom he had previously been in partnership, and he believes that he was then worth between £2,000 and £3,000. He attributes his failure mainly to heavy losses in respect of speculative undertakings outside his business, and to his expenses having been in excess of his profits since December, 1884. A large proportion of the creditors are resident in the United States, the debtor having an office and agent in New York. The first meeting of creditors is fixed for Nov. 1st, and the public examination of debtor for Nov. 3rd.

THOMPSON V. THE MAYOR AND CORPORATION OF STRATFORD-ON-AVON.—This was a motion, heard before Mr. Justice Charles, on Friday, on behalf of Mr. William Thompson, of Evesham-road, Stratford-on-Avon, architect, to restrain the defendants, their servants and workmen, from using a piece of land near his house as a sewage farm, so as to cause a nuisance. Mr. Marten, Q.C., and Mr. Brinton, for the plaintiff, referred to the Public Health Act, 1875, section 27, and the Rivers Pollution Act, 1876, section 3. The defendants had no right to cause a nuisance, and if they used the best practical means to render the sewage harmless the Local Government Board would permit them to discharge the sewage into the river Avon. The plaintiff by his evidence had proved an intolerable nuisance, which the defendants did not deny; they only said that they had very much mitigated the nuisance. Mr. Justice Charles said that he was not satisfied that the plaintiff had made out a case for an injunction; having regard to the balance of convenience, he made no order except that the costs be costs in the action.

SERIOUS CHARGE AGAINST AN ARCHITECT.—Thomas Fleming, architect and surveyor, of Streatham, and formerly of Southsea, where he owned a large amount of house property, was charged at the Portsmouth Police-court on Monday with forging and serving a writ purporting to have been issued from the High Court of Justice. The fictitious writ, which was on an official form, was served upon Mrs. Clarke, of Southsea, and claimed damages from her on the ground of slander and for harbouring Mrs. Fleming, his wife, during the last two years, thereby ruining him. The prisoner, who, when arrested, said he merely intended the document to be shown to Mrs. Clarke, was remanded.

STAINED GLASS.

ST. MICHAEL'S AND ALL ANGELS' CHURCH, BEDFORD PARK, CHISWICK.—Two stained-glass windows have been erected in this church. The subject of one is Our Lord seated on a throne surrounded by the nine orders of angels bearing their respective symbols. In the upper part beneath are (in the six outer lights) the four-and-twenty elders offering crowns, and in the centre light is a cross with the four Evangelistic symbols—viz., SS. Matthew, Mark, Luke, John—the whole idea being to represent Our Lord as described by St. John in the Revelation, surrounded by the heavenly host. The small east window of the south aisle is one of a series designed to show the ministration of angels, and represents the Angel and the Mary's at the tomb on Easter morning. In the lower lights above are angels bearing scrolls. The work has been designed and executed under the personal supervision of Mr. Daniel Bell by Mr. R. Davison. Mr. Maurice B. Adams, F.R.I.B.A., is the architect.

The Ipswich School Board had under consideration last week the appointment of an architect for proposed new schools for 250 girls and 250 infants, as an addition to existing boys' school in Bramford-road. A proposal to institute a competition was defeated, and eventually Mr. E. Fearnley Bisshopp, of Ipswich, was elected by seven votes to three over the other local architect named, Mr. Bisshopp having designed for the board the Rose Hill Schools, which were reported by the building committee to have given more satisfaction than any other schools erected for the board.

The Bishop of Ripon consecrated on St. Michaelmas Day the church of St. Mary, Ingleton, which has been practically rebuilt at a cost of £3,200, from the designs of Messrs. Sherlock, Wood, and Keep, architects, Liverpool.

Monday next, the 10th inst., has been appointed for the reception of works of art intended for the autumn exhibition of the 19th Century Art Society, at the Conduit-street Galleries.

Our Office Table.

WE regret to announce the death of Mr. James Stanning Edmeston, A.R.I.B.A., of 42, Old Broad-street, E.C., and district surveyor of Charlton, which took place at his residence, 5, Lansdown-road, Blackheath, on Wednesday. The late Mr. Edmeston was a pupil of the late Arthur Ashpitel, V.P.R.I.B.A. (to whom his father was formerly managing clerk), and was afterwards with the late Sir Gilbert Scott, R.A., for three years, at the time when the Midland Terminus and Hotel (St. Pancras) designs and those for the Law Courts competition were in hand. In conjunction with his father, Mr. James Edmeston, F.R.I.B.A., Mr. J. S. Edmeston has since carried out many important works of a commercial character, and was the architect to the London and South Western Banking Co., for whom he had just completed new branches at Wimbledon, Bow, Hackney, &c. He also designed the very important head office, having a frontage in Fenchurch and Gracechurch-streets. Eleven years ago the late Mr. Edmeston, jun., joined the Royal Institute of British Architects as an Associate, being one of the few candidates who prepared for and passed the former voluntary examination, in which he came out in the highest or proficiency class. In January last he was elected district surveyor for Charlton, Lee, and Kidbrooke in succession to the late Mr. James Collis. Mr. Edmeston, who had been in failing health for some months, died from enlargement of the spleen, the end being hastened by a bronchial attack. He was about 40 years of age.

A CORRESPONDENT of the *Times*, signing himself "Fever Stricken," has appealed to that journal to protect the public against unqualified persons acting as architects, adding :—"Surely it is time that architects themselves should protect their own interests by agitating for Government interposition, that a system of compulsory examinations may be established, as in law, medicine, and other professions, to prevent incompetent persons from bringing discredit on a calling which ought to stand in the highest public estimation. When really effective checks have been enforced, we shall hear no more of terrible tragedies like that at Exeter, and we simple-minded and trustful members of the community, who take houses in London or elsewhere, will not have to suffer from outbreaks of fever caused by the architect's utter ignorance of the most elementary laws of sanitation." To this Mr. H. R. Gough, F.R.I.B.A., Chairman of the Architects' Registration Act Committee, has replied, pointing out that strenuous efforts are being made by the architectural profession to obtain an Act of Parliament for the registration of all at present in practice, and the compulsory examination of all hereafter desirous of entering its ranks. Mr. Gough fully admits the serious charge, that very many so-called architects are utterly ignorant of the most elementary laws of sanitation, and this being so, he holds that "it is of the utmost importance that, for the protection of the public and for the honour of a noble profession, the same safeguards should be provided to prevent incompetent persons from practising as the Legislature has deemed necessary for law and medicine. With such purpose in view a Bill has been drafted, and will be presented to Parliament next Session."

THE Corporation of Birmingham, like the local authorities in most other large provincial towns, have experienced of late years increasing difficulties and inconvenience from the state of their building by-laws, some of which are obsolete, many ill-defined, and others, from frequent alterations, had become self-contradictory. Additional powers having been obtained by the Corporation under a Consolidation Act, a committee has been at work framing a fresh code, and this was submitted to the town council on Tuesday. It differs considerably from the model by-laws of the Local Government Board, and contains, among other features, clauses relating to the details of the plans of houses to be erected in new streets, the entrances to courts, the covering of unwholesome sites with concrete, regulations as to the dimensions of staircases in houses, the thickness of walls in chimneys,

and the walls of ovens and furnaces, and the prohibition of the use of rooms over privies. The draft rules were submitted by the committee to the local Architectural and Master Builders' Associations, but neither body suggested any alterations, and the town council on Tuesday after some discussion adopted them without change.

Among the City Companies who realise their responsibilities and are making an endeavour to advance the interests of their craft is that of the Carpenters'. Their splendid new hall in London Wall has, for the past two or three years, been utilised for courses of free lectures on matters connected with the building trades by competent authorities, and they have recently offered a home to the Clerks of Works Association. Their latest movement is in the right direction — namely, the formation of the nucleus of a library of works dealing with the carpentering and joinery trades. The new library, which was opened on Monday, has two branches—lending and reference—and it will be available for the livery of the guild and for all those who have entered to pass the examination of the company and who have paid the fee of 5s. It will also be opened, on the payment of 5s., to any other person provided with an introduction from some liveryman of the company, from a member of the Royal Institute of British Architects, the Society of Architects, or the Architectural Association, or from some well-known employer connected with the building trade. Should the library prove successful, many other books will be added, so as to make it one representative of the building trades.

The movement for the registration of plumbers is rapidly making headway in all parts of Great Britain, but there is manifested a growing indisposition in great provincial centres to amalgamate with the London City Company of Plumbers. This was clearly shown at a meeting of the craft held in Edinburgh on Friday, when it was, after some discussion, unanimously decided to form an association for Edinburgh and Leith, for the registration of plumbers. Mr. Ogilvie, Principal of the Heriot-Watt College, intimated that the governors of that institution have under consideration a scheme for supplying the apparatus and technical knowledge of the various crafts. Mr. Thomas Proctor, President of the Edinburgh Master Plumbers' Association, having strongly supported the movement for registration, the following were appointed as a committee to take the necessary steps for the formation of an association:—Bailie Russell (convener), Councillor Miller, Mr. Thomas Proctor, Mr. Walter Brodie, Mr. Stewart, Mr. Allan Carter, and Mr. Hippolyte Blanc, architect, with power to add to their number.

Mr. S. Clapp, clerk of works to the new Victoria Courts, Corporation-street, Birmingham, died very suddenly at his residence, No. 3, Golden Villa, Rookery-road, Handsworth, on Saturday morning, from an attack of erysipelas. He was formerly in the employ of Messrs. Martin and Chamberlain, of Birmingham, and many important buildings in that town have been erected under his supervision. Amongst them are the Chief Fire Station, Upper Priory; Moseley-street Police Station, School of Art, Monument-road Baths, Staffordshire Bank, Messrs. Southall and Barclay's, and the residence of the Right Hon. Joseph Chamberlain. He was a prominent provincial officer of the Masonic Order and other friendly societies. At Tuesday's meeting of the Birmingham Town Council the Mayor, referring to Mr. Clapp's death, said he had performed his duties to the satisfaction of the committee, and had worked easily with the contractor.

By direction of the Kent Archæological Society, excavations are now being made in the neighbourhood of the ruins of Richborough Castle, with a view to discover whether any foundations of buildings can be detected outside the walls of the castrum, where the growing corn exhibits traces of roads or streets at right angles. These streets have been laid bare, and found to be composed of pebble roads, and the adjoining ground has been trenched. Only slight traces of wall foundations have been met with, but everywhere there are traces of fire and destruction of Roman buildings. Nothing of value or importance has been met with, except two legible brass coins, belonging to the latest periods of Roman rule in Britain. Many fragments of pottery of all descriptions have been met with, and quantities of burnt wheat, some of which appeared stored in Roman amphoræ. The work is being carried on under the direction of Mr. G. Dowker, F.S.A.

The twenty-third annual report of the Pearl Assurance Company states that, while giving every attention to the extension of the company's business, the directors have devoted considerable attention to its consolidation, with the result that over £28,000 has been added to the assurance fund during the year, as compared with £14,318 7s. 7d. added the previous year. Three hundred and seventy-one thousand nine hundred and forty-five policies were issued during the past 12 months, representing a new annual premium income of £142,808 17s. 6d. The total income for the year amounted to £218,848 3s., and exceeded that of the previous year by £18,862 17s. 7½d. The assurance fund, with capital paid up, now amounts to £152,470 3s. 3d., of which £28,241 12s. 9d. has been added during the present year, being nearly double the amount (£14,318 7s. 7d.), added to the fund in the previous year. The directors recommend that a dividend of 10 per cent. be paid in two half-yearly instalments.

Messrs. Maw and Co., the well-known firm of artistic tile makers, of Benthall Works, Jackfield, near Ironbridge, have reprinted from the *Journal of Decorative Art* an illustrated description of their works and productions. Sketches are given of the various processes of manufacturing encaustic tiles, and also examples of figure panels, tiled hearth slabs, and chimney-pieces at present on view at the Jubilee Exhibition at Manchester.

The works in connection with the new *cloaca* in the Via del Colosseo, Rome, have brought to light two large fragments of a marble frieze, which must have belonged to some temple or similar public building. They are about 3ft. 6in. in height. One piece, about 4ft. long by 7in. thick, represents a winged Diana. The goddess, of whom the face and one foot are wanting, is in hunting attire, wearing a short chiton and chlamys. The figure resembles in pose the well-known Diana at Versailles. Close by is another female figure wrapped in a mantle, with the right hand resting on the hip. She wears a Spartan tunic, gathered at the bosom and confined by a girdle. The right arm is ornamented with a bracelet, and the feet are sandalled. Separated from this figure by an oak tree, there is a male figure, of which only the right side is preserved, his hand grasping a hammer, at his feet an anvil and smith's tongs. It may represent Vulcan. The other fragment is not nearly so well preserved. It represents portions of two female figures, and possibly of Furies. Roman archæologists incline to the opinion that the whole frieze represented the Battle of the Giants.

MEETINGS FOR THE ENSUING WEEK.

Monday.—King's College, London. Public introductory lecture, "A Retrospective Glance at the History of Artificial Heating," by W. G. Macmillan. 7 p.m.

CHIPS.

Kingskerswell parish church was reopened on Sunday, after restoration from plans by Messrs. Rowell and Son, of Newton Abbot, carried out by Mr. Seeley, of Newton Abbot. The old floor, being in a bad condition, has been removed, and a new one laid down; the aisles have been laid throughout with red and black tiles, and seats of varnished pitchpine substituted for the old-fashioned high pews. Unhappily the work of restoration has not swept away the hideous gallery which hides the west window—the finest in the church, and the pulpit is conspicuous by its absence. A new bell has, however, been added to the peal, and another is promised.

The negotiations between the agents of the corporation of Edinburgh and Leith and of the Edinburgh Gas Company for the completion of the final agreement to give effect to, and carry out, the provisional agreement signed at London on 1st April last, have been brought to a satisfactory termination, and all questions between the corporation and the gas company finally adjusted.

An exhibition of paintings and sculptures by living artists is to be opened at Derby.

WATER SUPPLY AND SANITARY MATTERS.

Market Weighton.—The system of drainage and sewage works which Messrs. Turner and Sangwin, contractors, of Hull, are constructing at Market Weighton, from plans prepared by Mr. Bohn, C.E., Hull, are in progress, and on Friday the ceremony of laying the "memorial stone" of the buildings required at the sewage farm was performed by Mrs. Bohn. The works consist of nearly two miles of pipe sewers, with manholes and ventilating shafts; also about one mile and a quarter of under-drains at the sewage farm, which is on the intermittent downward filtration system. Of this work 960 yards of 18in. pipe sewers have already been laid, and the manholes and ventilating shafts constructed.

Stroud, Gloucester.—The works of the Stroud Water Company, commenced in May, are being rapidly pushed forward, and on Saturday the directors visited the works. Under the Stroud Water Act they have power to supply water in nineteen parishes in the old borough of Stroud. The Stroud Local Board area is now supplied from the board's reservoirs, and the consent of the board will have to be obtained before the company can supply within that area. One of the places to which the company's powers extend is eight miles from the site of the reservoirs. Messrs. C. Minns, of London, and V. A. Lawson, of Stroud, are the engineers. Mr. Dierden, the contractor, has sublet portions of the contract to Messrs. Chew and Sons, of Stroud. The company recently opposed, at an inquiry before a Local Government Board inspector, an application by the Rural Sanitary Authority to borrow £1,000 towards the cost of providing Painswick (one of the places to which the powers of the company extend) with a supply of water from the hills near that place. The company are constructing a reservoir at Chalford, and another on the high level of Minchinhampton Common, which will command the higher parts of the district. The source from which the water is obtained is the Midford Sands. By sinking a well at Chalford to the depth of 75ft. a plentiful supply has been tapped, which flows into the well, at the rate of 28,000 to 30,000gals. per hour. It is proposed to sink the well 20ft. further. Some miles of 10-in. mains have been laid, and the work is now going on in Stroud streets. The contracts for two pairs of engines and three boilers has been taken by Messrs. Holborow, of Duddridge, Stroud, at £4,750, and one boiler of 18 tons has been delivered. The building of the engine and boiler houses, stores, &c., is to be commenced shortly.

The first section of an esplanade constructed by the local board of Lynmouth was opened last week. It has a footpath of 12ft., and a roadway of 30ft., and runs from the Rhine Tower under the hills towards Riddy Ball. The work has been carried out by Messrs. Jones Brothers, at a cost of £1,200, who intend now to erect a lift from near the esplanade to Lynton.

Stained-glass windows have been put into the west end of Bath Abbey during the past week.

The partnership heretofore subsisting between Tunley and Co., of Clement's-lane, Lombard-street, architects and surveyors, has been dissolved.

The Swinton and Pendlebury local board has lately appointed Mr. R. Vawser, C.E., of Cooper-street, Manchester, to report upon a sewerage scheme for a portion of their district, which has a population of over 20,000 inhabitants, and an area of 2,200 acres.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, post free.—LESSER FRIEDLANDER, Tobacconists' Complete Furnisher, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 60 years.

Holloway's Pills.—The stomach and its troubles cause more discomfort and bring more unhappiness than is commonly supposed. These Pills have long been the popular remedy for a weak stomach, for a disordered liver, or a very enfeebled digestion, which yield without difficulty to their regulating, purifying, and tonic qualities.—[Advt.]

DOULTING FREESTONE.

THE CHELYNCH STONE.—This Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

HAM HILL STONE.

Greater facilities have been provided for working these Quarries and the Stone can be supplied in large quantities at short notice. Prices and every information given on application to

CHARLES TRASK and SONS,
NORTON-SUB-HAMDON, near ILMINSTER, SOMERSET.
London Agent:—
E. A. WILLIAMS, 16, Craven-street, Strand.

HYATT'S LENS and "SEMI-PRISM" LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

NORTH'S IRON BUILDINGS AND ROOFING.

Surplus Estates and Railway orders, all sizes. SALE or HIRE, from Railway Works. Some 1s. Sheets.
IRON CISTERNS, all sizes. Lists free.
LONDON ROAD, SOUTHWARK.
WORKS and STORES, MORDEN, SURREY.

BATH STONE.

PICTOR'S MONKS' PARK. CORSHAM DOWN.
BOX GROUND. FARLEIGH DOWN.
COMBE DOWN. STOKE GROUND.
WINSLEY GROUND. WESTWOOD.
PICTOR and SONS, BOX, WILTS.

BEST BATH STONE.

FARLEIGH DOWN, CORSHAM DOWN, BOX GROUND, COMBE DOWN, WESTWOOD GROUND. STOKE GROUND.
RANDELL, SAUNDERS, & CO., LD., CORSHAM, WILTS.

WM. OLIVER & SONS,

MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BETHNAL GREEN.—For alterations and additions to 354, Bethnal Green-road, for Mr. G. Medway. Messrs. Burr and Medway, 65, Chancery-lane, W.C., architects:—

Thomerson and Son	£87	10	0
Hood	83	8	9
Higgs	75	17	0
Lark and Son, Fore-street, City* ...	70	0	0

* Accepted.

BEXHILL, SUSSEX.—For finishing two houses in the Western-road. Mr. J. B. Wall, A.R.I.B.A., of Walbrook, London, and Bexhill, architect:—

King, J.	£520	0	0
Cole, J.	487	0	0
Sands, W.	480	0	0
Murrell Bros., Bexhill...	425	0	0

BIRMINGHAM.—For supplying the wrought-iron casements for the new Victoria Law Courts, Corporation-street, Birmingham. Messrs. A. Webb and E. I. Bell, 19, Queen Anne's-gate, Westminster, architects:—

Hope, H., 55, Lionel-street, Birmingham (accepted)	£663	0	0

BRISTOL.—For completing party-wall at Temple Backs, Bristol, for the Bristol School Board. Messrs. J. W. Trew and Sons, 22, Broad-street, Bristol, architects:—
Veals, W., Bristol (accepted).

BRISTOL.—For the extension at Bristol Post Office:—

Davis, D., Cardiff	£15,540	0	0
Wilkins, J., and Son	14,990	0	0
Wilkins, R., and Son	14,940	0	0
Krauss, A.	14,849	0	0
Davis, J. E.	14,743	0	0
Cowlin and Son	14,368	0	0

Rest of Bristol.

CHAGFORD.—For the erection of a rectory house and stable buildings, at Changford, Devon, for the Rev. G. H. Ley. Messrs. J. W. Rowell and Son, Newton Abbot, architects:—

Lamacraft, Dawlish...	£3,598	0	0
Reed, J., Plymouth	3,289	0	0
Matthews, F., Babbacombe ...	2,650	0	0
Aggett and Underhill, Chagford ...	2,200	8	4
Stone, W., Chagford...	2,182	0	0
Brimblecombe and Ellis, Chagford*	2,024	15	0

*Accepted.

CHEADLE.—For constructing a line of railway from Cheadle to Cresswell, for the Cheadle Mineral and Land Co. Mr. J. Forsyth, C.E., Stoke-on-Trent, engineer:—
Baker, C., and Sons, Bradford (accepted).

COLCHESTER.—For the alterations and additions to No. 54, Priory-street, for Mrs. E. White. Mr. J. W. Start, Cups Chambers, Colchester, architect and surveyor:—

Dupont	£193	0	0
Shead	184	0	0
Chambers	168	15	0
Ambrose (accepted)	142	0	0

CRIPPLEGATE, E.C.—For repairing the chiming apparatus and bells at St. Giles's Church, Cripplegate, for the vestry:—
Moore, J., and Son, Clerkenwell-close (accepted) £76

DEWSBURY.—For Queen Victoria Jubilee Board Schools, for 900 scholars, for the Dewsbury School Board Mr. J. Lane Fox, Central Buildings, Dewsbury, architect and surveyor. Quantities by the architect:—
Mason, joiner and ironwork:—
Chadwick, E., and Sons, Dewsbury.
Slater:—
Thompson, W. R., Dewsbury.
Plumber:—
Newsome, F., Dewsbury.
Plasterer:—
Binns, J., Dewsbury.

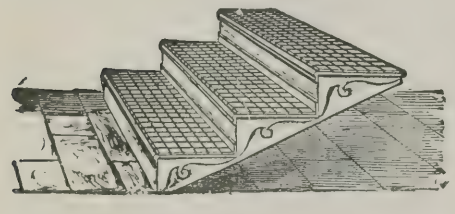
FAREHAM, HANTS.—For the erection of new whiting works, cottages, stabling, chimney shaft, and other works (exclusive of large iron roof), for Mr. H. Rogers. Mr. F. Bath, F.R.I.B.A., F.S.I., Crown Chambers, Salisbury, architect. Quantities supplied:—

Gammon, J. and A., Petersfield ...	£2,736	0	0
Young, W. J. and C. S., Salisbury	2,579	0	0
Stallard, G., Havant	2,440	0	0
Kite, H. J., Salisbury	2,414	10	6
Blackman, G. H., Fareham... ...	2,278	12	0
Plummer, J., Fareham	2,274	7	3
Light, W. R. and Co., Portsmouth	2,250	0	0
Corke, J. H., Southsea	2,030	0	0
Mitchell, C., Downton†	1,972	19	5
Ingram, H., and Son, Woking* ...	1,960	16	0½

† Accepted subject to deduction for gravel and cement.
* Withdrawn.

For large iron roof to above:—
Lysaght, J., Ltd., Bristol (accepted).

GIPSY HILL, S.E.—For decorative works to General Brownlow's house, 87, Gipsy Hill. Mr. J. Wall, A.R.I.B.A., 32, Walbrook, London, E.C., architect:—



Stacey Bros.	£187	0	0
Wilkes, P.	135	0	0
Phippen, W.	132	7	0
Leng, J. D., Deptford	130	0	0

GLASTONBURY.—For constructing a sewer in Land Mead, for the town council:—

Higgins (accepted)	£67	10	0

HAWKSLEY'S PATENT TREADS.

Proprietor & Manufacturer: J. WESTWOOD, Jun.

NAPIER YARD, MILLWALL, E.

Telegraphic Address—"Westwood," London. Telephone No. 5065.

Recommended for durability, simplicity, firm footing, elasticity, and are perfectly noiseless; they excel lead, oak, teak, or stone; applicable to wood and iron staircases, new and worn-down stone stairs, spiral and other staircases, footpath flaps to cellars, covers for drains and coal-cellars, flooring for public buildings and aisles of churches, &c., &c.—The best and most durable Tread or Step yet invented.

AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1710.

FRIDAY, OCTOBER 14, 1887.

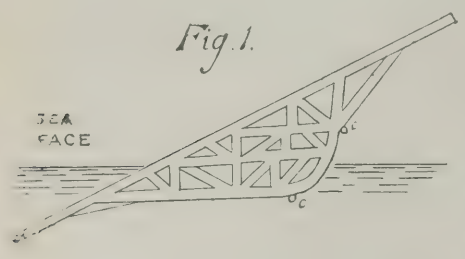
EXTRAS IN BUILDING CONTRACTS.

THE unfortunate and unhappy incidents to all building operations known as "extras" arise chiefly: first, from those who build not knowing their own minds; and, secondly, from ill-digested and imperfectly-prepared contract drawings and specifications. Perhaps it would be fair to the architect to say that hardly ten out of a hundred employers know what they really want or are able to comprehend plans and other technical representations of buildings. Suppose, for instance, a client instructs his architect to prepare a plan of a residence to have a certain accommodation, the architect perchance may design a house that will give every satisfaction on paper; but as soon as the walls of the building show above the ground, disappointment is expressed — a fancied lengthening of one room, a bay window, or some other alteration is required. As the second floor is reached, the demand for some rearrangement or additional bedroom is required, all of which might have been accomplished in an hour on paper; but the alteration of which in brick and labour is a serious item. It is not a reflection on the intelligence or education of the employer to state that he does not understand plans, though he often has the unfairness to assert that the architect ought to have explained to him, and that he was to blame for not doing so. Everyone, however indifferent he may be as to domestic house planning, has an idea of what is convenient, or must have seen a room that pleases him in its proportions and arrangement; the employer might have told his architect that he wanted a room like it, and it would have been easy to have obtained what he wanted. But not so. The client has the plan submitted to him, and as it looks well on paper and has the architect's recommendation, he is satisfied. What is more natural? The client depends on his architect's ability, but so does the latter depend on his client's comprehension. Unless the architect makes his client understand by pointing out every room, and going over together with him *seriatim* every feature—fireplaces, doors, windows, down to the fastenings and furniture of the doors—it is impossible to obtain a set of plans or a specification that shall be perfectly satisfactory. We think the employer is justified in requiring more detailed explanations than he often gets. Models of buildings are not often made, and even they would not convey an idea of the internal effect and fittings. Between the vague apprehension of his requirements and the misapprehension of the architect "extras" are sure to arise.

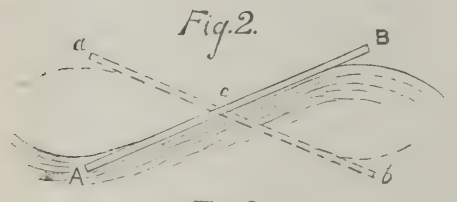
But there is another source to which we must allude—the imperfection of the drawings and specifications, for which the architect is, of course, solely responsible. They are hastily prepared from the barest instructions without a knowledge of the requirements of the employer, who is only asked to pass the plans. At this stage questions of a vexatious kind are usually "snubbed" or unheeded. The employer often asks if this or some other point can be altered, and the architect retorts that it cannot without incurring expense. Hurried preparation is one of the most prolific sources of extras. The plans and sections are still in pencil to a small scale, or only roughly drawn to a larger scale, and before they are inked in they are handed over to the quantity surveyor, who, perhaps, to save trouble attends at the architect's office. In this unfinished state of the drawings and without a specification, which somehow or other is generally the last thing finished, he commences to take out the quantities of the building. Only the most experienced hand can follow under these circumstances, or provide for omissions and imperfect data. We know that the surveyor has to grope his way in the dark very often, not knowing how the architect intends to have a roof constructed or some other detail finished. How can he do otherwise without details of these parts drawn to a large scale? General drawings to an eighth or a quarter of an inch scale cannot possibly exhibit the intentions of the architect with respect to the "labour" on a roof principal of a decorative character. How is it possible to tell dimensions of newels and balusters to a staircase of an elaborate kind? Or a detailed drawing of a cornice or some detail of masonry may exhibit work that has entirely escaped the quantity surveyor's eye in the unfinished pencil drawing from which he has taken his quantities, and yet these little extra details may make all the difference possible between the crude and unfinished work of a builder and that of the architect. It is true the surveyor often "lumps" and makes allowances to meet omissions, and the builder does the same in pricing; but it is convenient to disregard these and to take notice only of discrepancies found to exist between the drawings or any excess of labour. An extra may often mean an omission on the part of the quantity surveyor, but the client looks at both an extra and an omission as one and the same thing; they are practically "extras" to him. Another and larger source of errors is due to the uncertainty of the owner's mind. Some men are fond of making variations or suggesting what they think are improvements, but of course they do so with their eyes open, knowing the consequences of their want of decision, or, if they do not, the architect is to blame for not making them understand that alterations or additions are extras, and have to be paid for.

From the frequent difficulties into which the architect falls, and the questions which we receive from time to time appertaining to extras, it is quite clear that there is a great deal of misapprehension. We shall not refer to the ordinary construction put on the subject, nor the legal decisions that have become established facts, and with which most of our readers are acquainted; but we may draw attention to one particular aspect of the question, or its bearing upon completion, which is rather troublesome. We will suppose a builder contracts to carry out a work by a certain time under the usual penalty. During its progress the owner requires the builder to make some alteration or deviation from the plans, the consequence of which is the builder is delayed in completing the work by the time stated in the agreement. The question arises, Can the penalty for non-completion be enforced, or does the extra work ordered by the owner invalidate the agreement? The answer to this question will depend entirely on the circumstances of the case. If the contractor has pledged himself, whatever additions or extras are ordered, to finish by a certain day, he is bound to the letter of the contract, however unreasonable such a condition may be. This position is entered into by many builders without knowing the consequences. The law, however, as Mr. Justice Hannen said, will not help a man if he enters into a contract to perform an impossibility subject to a penalty. There are, however, few contracts drawn up in this one-sided manner. Generally there is a clause in the contract by which the builder agrees to complete by a specified date, or in default thereof to pay a penalty for every day that exceeds the time. Should the employer order extra work to be done, causing a delay, the law has ruled that such order does not put an end to the original stipulation, but that it entitles the builder to an allowance of so much time as may be required to complete the extra work.

It often happens, however, that the extra work entails the non-completion of the original contract work, and a complication arises as to the responsibility of the builder under the agreement. The law is not very clear on this case, though we may gather the spirit of it from the decision given in the case of "Thornhill v. Neate." To understand it we must refer to the facts. A builder agreed to build six houses for the defendant under a penalty of £1 for each house for every week the work should remain incomplete. The houses were not completed, and possession was withheld for twelve weeks after the day stipulated. The builder replied that it was agreed that he should perform other work upon the houses, and that such additional work was to be done within a reasonable time. He further contended that the work under the second agreement was so mixed up with the original work, being part and parcel thereof, that it was impossible to complete the original contract until the work under the second was completed. It was decided that the second agreement operated as a waiver of the stipulation as to time in the first agreement. From this case it will be seen there was a second agreement made between the parties, by which a reasonable time was allowed for doing the additional work, and that the original work could not be completed before the additions. The works under the two were mixed up together, so that it was impossible to complete the first before the second. We therefore infer from these decisions that if an order for extra work at all interferes with the contractor's performance of his contract the law will give him more time It is a question, however, whether a Court would look at the matter in this way should the extra works be performed without a second agreement being entered into allowing a reasonable time. Contractors must, therefore, not trust too much to the decision when there is no second agreement to operate as waiver of the stipulation as to time. The mutual agreement in the above case was a consent that the works should be postponed until the lapse of a reasonable time.

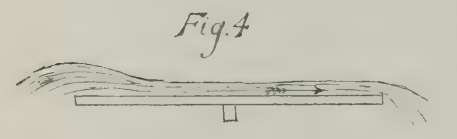


Builders are sometimes remiss in obtaining written orders for additions. A verbal order is given to do an "extra" either by the employer or his architect; the work is carried out, and the builder trusts to the architect, or rather to his honesty. The building is completed, and the order is forgotten or denied; the accounts are sent in for adjustment, but only those items are allowed which are confirmed by the written orders which the builder can produce. More necessary still is it to clearly understand the obligation under the clause as to completion within a given date, and to obtain remission of it when an "extra" is ordered, bearing in mind the ordinary contract provision does not discharge the builder's obligation to complete by a certain day under a penalty, but will enforce it in respect of the work under the original agreement. An order for additional work may not interfere with completing the original contract, but it may practically prevent the finishing of some decoration or room, in which case the contractor has a good plea for asking an extension of time; such, for instance, as the putting up of an additional cupboard or the decoration of a room. Generally there is not much difficulty in obtaining an extension of time under these circumstances, though it is safe to make it one of the conditions of doing extra work.



WORKS IN WATER.—XXXIV.

FLOATING BREAKWATERS.



(*Continued from p.* 313.)

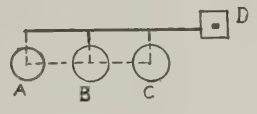
THE floating breakwater of Captain Sleigh is, in form, a sloping beach, the inclination offered to the waves being two horizontal to one vertical, or thereabouts, on being first struck. To support this floating platform, which is 50ft. or 60ft. in length in the direction of the waves, or say crosswise of the structure, a watertight caisson is constructed,

of which Fig. 1 represents a cross section. This, and the platform representing the beach, are made in lengths or sections of 60ft. or thereabouts, having their centre of motion in the main shaft, which runs through the length of the structure, and as many of these sections are jointed together as are required for different situations. The bottom is flat, and in smooth water is horizontal. This might be disputed; but we will confine our remarks to the manner in which it is represented by the inventor.

The elements of construction might be thus stated: If a very long plank or platform, A B in Fig. 2, float upon waves of water—leaving out of consideration for the moment the effect of wind—each part of it would oscillate vertically, the end A being at one period in the trough, and at half of the next period on the crest *a*, while the other end would be at the same period and half-period in the positions B and *b* respectively, and the centre *c* would rise and fall vertically, supposing the plank or platform to be rigid throughout; but if one end, A, were held down so that it could not rise above the mean level, the water above it, forming the crest of the wave, would travel onwards and up the slope, as shown in Fig. 3, being prevented from sinking into its accustomed hollow at the next half-period by the interposition of the platform, which it would then begin to sink by its weight, until both assumed a nearly horizontal position, as shown in Fig. 4, and the accumulation of water would shoot along the platform in a thin sheet with a velocity due to the height of the crest of the wave above it, and the vertical movement which it would have had in the absence of the platform would be converted into a horizontal one, which, taking place at or not much above the mean level, would not create further waves of any considerable height.

If one end of such a plank or platform were strongly buoyed up by a floating caisson while the other were held down, the force due to the height of the crest of the wave arriving at its edge would be expended in driving the water up the slope with such violence as to break part of it into spray on or before its arrival at the top of the slope; but before this effect could take place the inclination of the platform would become much reduced by the weight of the water upon it acting beyond the centre of motion, and it would assume a more horizontal position, pressing the caisson into the water, the floating power of which would again bring up the platform to its inclined position in time to receive the next wave, and so on. Captain Sleigh described his invention as a method of forming sheltered harbours by the employment of buoyant sea barriers, which are also useful in the formation of breakwaters and the protection of pier heads, embankments, &c.

We have just shown what the action would be, but Captain Sleigh claimed that the platform would be always maintained in a sloping or oblique position, that it would form a sea and wind barrier for sheltering ships and other vessels, and also pier heads, bridges, and other structures requiring such shelter from the ordinary destructive effects of heavy seas and gales of wind. The caisson was to be made, preferably, of ribs of timber, strongly planked on the outside and made watertight and buoyant; but it might be constructed of iron plates if desired. The back part of the caisson was to be rounded, the bottom flat, whilst the upper surface or back was to rise at an acute angle, forming an inclined plane extending longitudinally the whole length of the structure. The lower end of the platform would be immersed in the water. These floating breakwaters might be made of any dimensions, and in order to form a sea and wind barrier or harbour of refuge, a suitable number might be moored end to end, either in a straight or curved line, connected together by universal ball and socket joints or links and toggle joints, placed at the ends of the main beam, "by which they would be allowed to roll on their centres of gravity, or yield temporarily in any other way to the violence of the winds and waves." They were to be moored to the bottom of the sea by chains or cables attached to rings, *c* in the figure, at one end, and at the other to anchors fixed in the ground. In place of the peculiarly-shaped caisson or floating vessel above described, the sloping platform might be attached to a framework supported by a number of hollow and watertight wood or iron vessels, or the inclined platform might be employed even without any floating support, by connecting it at one edge by means of chains or cables to the bottom of the sea in such manner that the other edge may rise from the water in an inclined direction. A Select Committee was formed in 1860 to inquire how far it was practicable to afford better shelter to shipping upon the coast by the adoption of some plan for the construction of breakwaters and harbours less costly and better adapted for certain localities than the system of solid masonry, and before this committee Captain Sleigh replied to the question whether or not there was a doubt of the power of resistance of his floating breakwater to the force of the waves and the wind, tending to drive it from its moorings, that it had been ascertained by calculation that it was impossible to drive a structure of that shape from its moorings, in consequence of its presenting so very modified a resistance to the waves and the wind, being at an angle of 12° only from the horizon; and to a further question whether there was no danger of the cable or moorings being corroded, and so, in course of time, becoming rotten and giving way, Captain Sleigh replied that cables remained in use for forty years; that in Dublin Bay and elsewhere it was found that not a sixteenth part of the iron had been corroded after forty years; and as to the action of the sea and the friction of the cables upon a rocky bottom wearing them through before it could be known, he replied that that might be so eventually if they were not examined, but they could be examined daily if desired, and that, at any rate, they could be examined as frequently and effectively as any fixed work. The chain attached to the anchor was an endless chain, or, as sailors call it, a messenger, which permits of being hauled round, and every link examined; and as to the ring of the anchor, round which the chain passes, a diver could go down, or any sailor would jump overboard and dive down in nine fathoms water for half a crown, and see whether it was perfectly right or not.



In questions of this sort lightships are often referred to, and it was suggested to Captain Sleigh that these have frequently broken away from their moorings during heavy storms; to which he replied that they had been badly moored. The form of a light-vessel was one of the most powerful agents in dragging an anchor up: there were two violent actions in a wave, the vertical or lifting power, proportionate to the buoyancy and extent of the structure placed on it, and the horizontal force of the crest of the wave, and the shape of a light-vessel was the best form of lever for weighing an anchor. In weighing an anchor in a launch by the stern, the stern is hove down nearly to the water's edge, and then the men rush forward to the bow to exercise that leverage which a light-vessel and every other vessel exercises at anchor. The leverage is similar in the two cases; the fulcrum is near the resistance; the lever is of the first order; and that is the form of leverage in operation in all cases in which the undulation passes underneath a structure. A ship's anchor sometimes holds so firmly that it has to be abandoned. With a range of 50 or 60 fathoms of cable in 10 fathoms of water, if the ship be made fast by the stern, and the anchor be attempted to be weighed, it is not in the power of any ship's company to bring it up: the capstan and bows of the ship would be torn out before the anchor would come home. But as to the strain upon an anchor, it depends greatly on the length of the cable. It is very small with a sufficiently long cable. With 100 fathoms of chain cable in 15 fathoms depth of water the chain would seldom be raised from the ground anywhere near the anchor, and therefore there would be but little strain upon it. On the question of mooring, Captain Claxton's opinion was that whatever might be the force of the waves, no matter how high, the cables by which the sloping breakwater was moored would be very little strained. The mooring chains would be fastened to either anchors or screw moorings, according to the nature of the ground and depth of water, and there would be to each length or section of a line of breakwater four cables on the sea face, each 80 fathoms in length, a cable at each end, and four inside on the shore face; so that for each section there would be ten attachments to the ground through the means of long cables, which would put very little strain upon the anchors or screw moorings. Considerable stress is laid upon this point, because it had been frequently said that any floating breakwater would be driven from its moorings. It seems, however, to be a question only of the strength of the cable itself, and not of the mooring to which it is attached; and as to the strength of any cable of given dimensions it is very well understood, the testing being a daily practice in

the dockyards. On the question of breaking adrift, nothing could be more emphatic than the statement of Captain Claxton—that "it will not break adrift; it shall not break adrift; it cannot break adrift; that is my answer. I am prepared to say that such chains and moorings can be found and laid down that it shall not be possible for a floating thing like Captain Sleigh's to be broken adrift." Another question arose: What was to become of a vessel if it were to run upon this sloping beach-like platform in a gale of wind? And Captain Claxton's answer to that was that the vessel would slide up the incline and depress it, but would not break it to pieces; the breakwater might be damaged by such an occurrence, but the vessel would be safe; it would go over it. On the general question of the height of the waves on some parts of the coast, Captain Claxton may be said to be an authority, for he was engaged in determining that question in conjunction with Mr. Brunel when he designed the *Great Eastern* steamship. The heaviest seas are upon the western coast of Ireland; the force of the sea depends upon the length of the fetch, which is greater there than anywhere else, and on that coast there may be seas 25ft. high; but in the North Sea Captain Claxton was quite sure there was never anything more than 14ft., for in deciding the height of the side of the *Great Eastern* he passed part of a winter in measuring the height of waves in the North Sea. He went in a steamer on purpose for Mr. Brunel, and made a great many measurements in gales of wind, and the average came out at about 14ft. A modification of the form of cross section of Sleigh's breakwater seems to have been made, whereby the height above water was reduced and the depth of immersion increased to 12ft., which was done with the view to prevent the undulation of water passing beneath the caisson.

IMPROVEMENTS IN CEMENT BURNING.

THE profitable production of Portland cement at the present time depends to a very great extent upon the economy practised in the use of fuel, and the more or less perfect method in which the waste heat of the kiln is employed in drying the compound of lime and clay used in the preparation of the cement. Most of the recent improvements in cement-making have been based upon an appreciation of these facts; thus the semi-dry process of Goreham aimed at avoiding the excessive use of water, and reduced the amount of liquid to be evaporated to a minimum. Again, the chamber-kilns of Johnson provided a ready mode of utilising the surplus heat in the burning for the desiccation of a fresh charge of the slurry; and the so-called dry-process has enabled the manufacturer to produce a mixture of lime and clay with the smallest possible amount of moisture. The dry-process, which has been used for many years abroad with the most complete success, has at present found but few exponents in this country. There can be no doubt that by this means a far more uniform and perfect admixture of the ingredients is secured than by any of the old-fashioned methods, and we look forward to the time when English cement-makers will abandon the antiquated and expensive system of the production of a wet slip in favour of the more rational and cheaper dry-process. The improvements in modern grinding machinery, and the invention of powerful plant adapted to the production of pressed bricks from a slightly moistened dust of lime and clay, enable the cement manufacturer to work from the mill to the kiln in one continuous process, as bricks can be made dry enough to be stacked at once in the hot-air chambers, or even, as Mr. Charles Spackman, of the Barrow Portland Cement Works, has just demonstrated, in the kiln itself. The improvements in the plan of burning patented by Mr. Spackman are, we believe, destined to effect a revolution in cement manufacture; and, as we have from time to time drawn attention in these columns to all matters of interest relating to Portland cement, we have taken some pains to acquaint ourselves with the details of the invention, for which letters patent were granted in February, 1886—No. 2,659.

The kilns employed are those of the ordinary type, and are of the usual intermittent form—*i.e.*, they are charged, burnt off, and allowed to cool. One great advantage, indeed, of the new plan is that the structural alterations needed to convert a set of existing kilns so as to enable them to be worked on this system are relatively small. The kilns are each provided at the top with hinged dampers or covers, preferably of cast iron, which may be raised or lowered at will by levers, or chains, or other suitable arrangement. The novel features are the provision of external wrought-iron flues in the nature of those attached to blast-furnaces, by means of which, aided by a forced draught, the waste heat, and even the products of combustion, may be extracted and discharged at will from or into any one of a series of kilns. We will explain the arrangement by means of a small diagram:—

Here A, B, and C are kilns which are connected by two series of flues, the one above the level of the charge, or, say, along the foot of the domes, or conical chimneys, the other below the ground, or connected with the spaces beneath the bars; the whole system of flues is worked from a fan, or blowing-engine, at D. In order to render each kiln capable of being worked independently, the space below the kiln is provided with iron shutters, or movable screens, and the flues are each furnished with stop-valves, which can readily be opened or closed. By means of this system of flues the waste heat or gases from A may be extracted and passed into B or C, or a current of cold air may be drawn through any kiln of the series and heated by contact with the charge of burnt cement, and subsequently passed into another kiln filled with unburnt materials. Let us examine how the system of kilns would be worked. We will suppose that kiln B is loaded with wet material—*i.e.*, the compressed bricks made on the semi-dry process (containing from 25 to 30 per cent. of moisture). The charge in kiln A has been burnt off in the ordinary way by means of interstratified fuel, and will consist of a mass of hot cement-clinker, the upper portion of which will be in a state of glowing redness. At about this stage of the calcination the metallic covers at the top of the dome of each kiln will be closed, the loading holes carefully stopped, and the drawing holes closed by means of the screens or shutters. The branch pipes connected with the tops of each kiln are then opened by means of the valves, and the exhauster at D, or whatever apparatus may be employed for producing a forced draught, is set in motion. The effect of this is to draw a current of air through the heated clinker in A, which air speedily acquires a high temperature, and passes along the iron flue, and enters kiln B above the level of the charge, penetrates downwards through B, and finds an exit at the outlet flue beneath the draw-hole, passing back to the blower or fan at D. The operation is continued until the contents of B are dry, by which time the clinker in A will be found to have been cooled down sufficiently to be drawn. The charge in B may then be lighted, and when B is burnt off the hot clinker may be used to dry a fresh charge in C, or in A, for the flues may be worked in either direction. It will be evident from this brief description that Mr. Spackman's invention is an exceedingly simple one; but to anyone who is practically conversant with the manufacture of Portland cement it will at once be apparent that an immense economy is obtained, first, in using the hot clinker for the drying of a fresh charge; secondly, in rapidly cooling-off a kiln; and, thirdly, in the avoidance of repeated handling of the green charge. At the very lowest possible estimate the saving secured amounts to one shilling per ton of finished cement in the cost of the manufacture. In many works the reduction in the cost would be fully double this sum, and, moreover, the wear and tear of kilns is decreased. Another great saving is in the area of land needed for the factory, while the whole process is rendered more manageable and compact by the adoption of this invention. In the works of Messrs. Ellis at Barrow-on-Soar, where Mr. Spackman's plan is in use, the cement is produced from a mixture of lias limestone (the well-known "Barrow lias") and shale from the same pits. A very uniform and high-class cement, with a tensile strength of from 500 to 600lb. per square inch in seven days is obtained by means of this process.

THE SOCIETY OF ARCHITECTS AT YORK.

WE conclude to-day our report of the visit of the Society of Architects to York, which aroused considerable interest in the city, and other towns in the county. On Thursday, the members visited Ripon Minster and Fountains Abbey, returning to York for an evening meeting at the Church Institute. Mr. A. Pollard, President of the York Architectural Association, occupied the chair, and a paper was read by Mr. Edgar Farman, of London, hon. secretary of the Society, entitled

THE REMUNERATION OF ARCHITECTS.

In his introductory remarks, Mr. Farman pointed out that in former days, and probably in the earliest times, the payment of architects was by time—so much money for so many days, weeks, or years spent on a given work. Such a system could not long survive the severance of the duties of the designer from those of the personal superintendent and chief constructor, when the architect was no longer on the building, but confined himself to his office; becoming, in fact, the architect of the present day, and delegating to others many of the duties which in earlier days would have fallen upon him. The change, probably, led to the adoption of the present system—viz., payment by a percentage upon the value of the work executed. We do not know the exact date when it first came into use. Under large corporations the salary system still lingers. The Government, the larger ancient companies, and some town councils all employ salaried architects; but whenever they require really good work they appeal to the general practitioner, by competition or otherwise. What salaried official in these days, for instance, would have given us the Houses of Parliament, the Law Courts, or the Manchester Town-hall? The architects for these and all similar successful buildings have been paid by commission—paid for their production, and not for the time spent thereon. Whatever may be said against the payment of architects by percentage, it is evident that under this system the vast majority of the better works of the present day have been carried out. The system, in fact, has proved successful; its simplicity commends itself to all parties, especially at a time when payment by commission is one of the principal articles of belief of every business man. For some time past, however, dissatisfaction, more or less pronounced, has been expressed against this percentage system. Mr. Farman continued: There is a class of architects who object altogether to the now customary practice of adopting

the scale of charges based on the percentage system issued by the Royal Institute of British Architects in 1872. Let us therefore consider the architect's position at the present day, the system of payment under which he works, and the effect of the same. Although the Institute schedule has been usually followed, it must not be thought that it will be admissible as evidence in a Court of Law. Because the members of a profession band themselves together, and make a set of charges which they agree to follow, this will be of no avail against a stranger if such charges are excessive. Under special circumstances only would the schedule of the Institute be admissible as evidence, such as in the case of an agreement between an architect and his client that the schedule should be evidence or an agreement that the fees shall be according to the schedule. Except as aforesaid, a jury will always be directed to find what is just and due to an architect for the work he has done, and not what is due to him under the scale issued by the Institute, or any other society. Of course reasonableness can be pleaded by a plaintiff in support of his fees, and he may obtain the testimony of architects of standing to give evidence as to the fairness of the scale issued by the Institute; but such would only be by way of personal evidence of what is reasonable. It would be quite open of course for a defendant to put in other witnesses to give evidence in an opposite direction, and put in a scale issued by some other society in support of their views. In the result we have it that no scale issued without the authority of an Act of Parliament will be of any use in a Court of Justice, for no scale issued by any society will be recognised as evidence of proper charges. The Bill that has been drafted by the Architects and Engineers' Registration Act Committee for the purpose of State regulation of the profession provides for the subject of remuneration, and adopts the schedule of the Institute *in toto*. When this Bill becomes law, besides the many other benefits that the profession and the public will derive therefrom, there will be brought into existence a recognised schedule of fees capable of being admitted as evidence, and upheld by the law of this kingdom. An architect's services are therein considered as equivalent to 5 per cent. on the outlay. The question as to whether a professional man ought to be paid by commission has been much disputed, but it is very difficult to find any better mode. Various methods have been suggested, one of which was discussed in the professional journals, in which a gentleman proposed that a calculation should be based upon the size of a building or upon the area of ground covered. This method appears to me to be absolutely unworkable, for in many cases a building of huge area devoid of detail would be productive of a better remuneration for the architect than one of smaller area, which perhaps through its nature might incur untold labour. The suggestion of charging a fixed price before starting work has a good many supporters, and, in fact, it seems in many instances to be followed in practice. The arguments of those in favour of such a scheme are—first, that an architect is an artist, and that he should be paid according to his ability and the beauty of his designs; secondly, that by having a fixed standard a first-class man only gets remuneration at the same rate as his office boy would be allowed (supposing he could get any clients to instruct him); thirdly, that a client is much more easily satisfied, and likes to know what he has got to pay before he begins his work. The first argument—viz., that an architect is an artist, and that he ought to be paid as such—is all very well, and no doubt he would be held as such if he confined himself to simply designing; but this is not the case. An architect always undertakes, not only the designing, but also the superintending of the erection of the building; he issues certificates, takes measurements of the work done, and calculates the value of such work—in fact, by a thousand and one acts constitutes himself nothing more or less than the agent of his employers for the special purpose of erecting a building. This being so, the custom has arisen of paying him in the same manner as other agents in business, by a percentage. As to the second argument, I do not think this a very serious contention. There is nothing in the world to prevent a man high up in his profession making what charge he likes. It is no argument to say that because a young man who has just set up is allowed to charge at the rate of 5 per cent., therefore everybody is obliged to do so. There is absolutely no reason why an architect should not charge more than the scale, and there is absolutely no reason why he should not charge less if he is so inclined, except that of keeping up the status of his profession. There is no recognised fixed scale of fees for lawyers, and those gentlemen who have risen high in this profession do not wait for the scale of fees allowed by law to be raised before they ask for better payment. Why should they? The argument that a client likes to know that he will have to pay beforehand is, in my opinion, the only contention in favour of such a scheme; but this appears to me to be a very one-sided arrangement, for to give a figure to cover everything one must include extras and numberless unforeseen occurrences, which may give the architect an enormous amount of trouble, which extra work his employer is sure to expect him to include in the fee fixed at the commencement of his work. It is impossible to foresee events, and an architect, in my opinion, ought not to be bound down at fixed charges, as it places him at great disadvantage in case of extra work. The death of an architect or engineer dissolves his contract with his employer. If he has undertaken to do the work for a certain sum, and dies before its completion, his representatives can recover nothing. But if payment for the work is divisible, then so much as has accrued due at the time of death is recoverable ("Stubbs v. Holyhead Railway Co.," L.R. 2, Ex. 3,113). This point, therefore, should be remembered in undertaking to do work for a fixed sum—viz., never undertake to complete it for a fixed sum, for in such a case you will not be able to recover any fees until you have completed the work, and in the event of your death before completion your labour will be lost, as far as you and your representatives are concerned, for they would not be able to recover a farthing, as your contract would not be complete. In such an arrangement it would always be advisable to arrange that you will do the work for a certain total sum, to be paid in certain proportions as the work progresses, and in the case of stoppage of works through any unforeseen cause such a proportion of your fee calculated according to the work executed. I should, however, advise a distinct sum to be stated for the plans. If by any means an architect's fee is divisible the law will support such, and give relief in the case of his death; so if an architect agrees to undertake the erection of a building at 5 per cent. on the outlay, he will be entitled to 5 per cent. on the amount of work done by him up to the time of his death. Again, suppose an architect agreed to undertake and *complete* a work at 5 per cent. on the outlay, according to the rules laid down in the schedule of the Institute his representative would, in the case of his death, be able to recover any instalment due at his death, although he may not have completed his contract. The reason for this is that the payment for the work is divisible. There is nothing, however, in the world to prevent a man having any arrangement he likes with his clients as to what his charges shall be, but such agreement he will be held to. That an agreement of some sort should be entered into before commencing any work is most desirable, whether it be simply to abide by the schedule issued by the Royal Institute of British Architects, or any other scheme of payment. Bear in mind that if you agree to make drawings on approval you will not be entitled to make any charge for them until they are approved of; so that although you may have made many alternative drawings for a fastidious client for his approval, you will have no remedy against him if you are not able to satisfy him, and he abandons the idea of building. This was decided in the case of "Moffat v. Dickinson," 224 I.C.P., 265. In that case the committee of visitors for erecting a county lunatic asylum authorised their clerk to write to the plaintiff architect, Moffat, and inform him "That they were ready to agree to the sum of £437 10s. to be paid to him for his services in examining the site, preparing the requisite preliminary drawings for the approval of the committee, and all other drawings and documents required (by an Act of Parliament) to be submitted to the Commissioner in Lunacy, and afterwards to the Secretary of State, &c., &c." Mr. Moffat accepted these terms, and sent in a set of drawings in April, 1848. These were not approved, and he sent in a second set in April, 1849. Again he had them returned with a request to make another set. This he did, and sent in a third set in the following June. In August of the same year the committee sat in judgment on the third set of drawings, and came to the conclusion that as they were not such as they could approve of they must reject them altogether and proceed no further with the matter. Mr Moffat was naturally much annoyed at his treatment, and brought an action for the recovery of the fees he claimed for the work he had done; but it was held that he had no remedy, and that when an architect agrees to prepare probationary drawings for approval, and all the working drawings and specifications, he is not entitled to payment until his drawings are approved. There appears to be no provision made in the schedule of the Institute for charges in connection with preliminary sketches, except that the 5 per cent. is to cover them. This latter is all very well so long as the work goes through, but it often happens that no more progress is made except the getting out of the preliminary drawings. There is nothing in the schedule to provide for such an event. I think that some more distinct rule should be laid down on this head for the guidance of practitioners, and more especially to convince their clients that sketch-plans must be paid for. I see no objection myself to basing an architect's remuneration on commission, but that it should be a fixed commission seems to me to be a great mistake. Why should a man be paid at the same rate for putting up a building utterly devoid of detail as he is for erecting such a building as a church, full of intricate and delicate detail? In the first case perhaps half a dozen drawings will be sufficient; in the second half a hundred would probably be insufficient, not to speak of innumerable attendances at meetings of the building committee and such work. Again, with reference to the drawings themselves, the schedule goes on to state that this 5 per cent. commission is to include preliminary sketches, drawings, and specifications sufficient for an estimate and contract; detached drawings and instructions for execution on one set of tracings and duplicate specifications, and so on. Now, architects always regard the drawings as their property, and that they have the right to retain them on completion of the works. Having this in mind, there was inserted into the schedule the following statement: "In respect of the ownership of the drawings and specifications, it has hitherto been the general custom for the architect to be paid for their use only, these documents remaining his property." It is there stated that no decision at law had been come to on the point at the time of compiling the schedule, and consequently it is better to have a distinct understanding beforehand. Now, of course, it is very natural that an architect should object to parting with the plans of a building to the building owner; but unless he has distinctly contracted with his employer not to do so, there is no doubt in my mind that he must do so, no matter how distasteful to him. There has been no case decided on the point that I am aware of. Some time since a case was tried at Westminster, when this point was raised, and it was sought to prove a usage that the property in the plans always remained in the architect. Now, in order to uphold a custom, there are various requisites necessary in law, one of which is that a custom must be reasonable; and as to the reasonableness of such a custom as we are considering, Baron Bramwell, one of our judges, expressed a strong and adverse opinion. Surely he who has paid for the drawings is entitled to them; there is no getting away from this fact. Again, suppose custom is pleaded in support of the architect retaining the plans. Here it is attempted to withhold from the employer the very evidence and records of the construction of his building, the position of the drainage, &c. The law would never sanction such a custom, which, upon the face of it, would be an unreasonable one. There is nothing, however, to prevent an architect from keeping copies of

the drawings he has prepared if he chooses to do so. It has always puzzled me why this point was not settled in the schedule instead of inserting a sort of saving clause, which is of no use, for it makes the very schedule in itself conflicting. In the first place, it specifies that the charge of 5 per cent. commission shall include the drawings which are therein set out, and these attempts to back out on a plea of custom. I call the schedule misleading on this point, as many architects are led to believe that the drawings are not the property of the client, no mention being made of the legal difficulty to be got over in upholding such a custom, or the remarks that have fallen from Baron Bramwell on the subject. As many clients agree with their architects to pay them according to the rules of the Royal Institute of British Architects, it would have been much more advisable, instead of relying on an alleged custom, that in Clause 11, instead of stating so distinctly that 5 per cent. included the drawings, they had stated that such charge included the preparation and use of the drawings for the purpose of the carrying out of the works, and another clause could have easily been inserted to the effect that an employer desiring to have a record of the building could have duplicates supplied to him for his own use on payment of an extra fee. The question, therefore, gentlemen, resolves itself thus: Is the method of basing the remuneration of architects on the percentage system a good one or not, and, if not, what alternate scheme can be suggested? A short discussion followed.

On Friday, the closing day, the members of the Society visited a number of the most important ancient buildings in the city. At St. Mary's Abbey they were received and conducted over the ruins by the Rev. Canon Raine, after which they were shown over the Museum and gardens and the Manor House, and thence they proceeded to the Minster, where Mr. Bradley, the clerk of the works, conducted the visitors over the building. An inspection of the library concluded the visit. In the afternoon the members of the Society visited the Mansion House, where they were received by the Lord Mayor (Sir Joseph Terry), who very kindly conducted the party, numbering about 40, over the building. Before leaving the visitors were entertained by the Lord Mayor.

Mr. Edgar Farman in proposing "The Health of the Lord Mayor," mentioned that the Society annually made visits to centres of interest in the provinces, and had selected York this year because the city abounded in an unusual number of ancient and interesting buildings of Mediæval times; and, secondly, that this year they had the honour of an invitation from the York Architectural Association.

The Lord Mayor said that it had given him very great pleasure to receive the Society on the occasion of their first visit to York. He hoped that the time was not far distant when the Society would again visit York. He himself was a staunch supporter of preserving all monuments of the past. It was through such societies as the Society of Architects that the ancient styles of architecture were perpetuated. He could not, however, but be struck with a comparison of old work with that of modern times. The ancient builders seemed to have built in a much more thorough manner than is now done. He did not say that they had better architects, but presumed that funds were more easily procurable than now. He was sorry that through pressure of business the president of the Society, Mr. J. J. Lish, of Newcastle, had not been able to stay for the latter part of the business.

The Lord Mayor then proposed "The Health of the President of the Society of Architects, coupled with the Health of Mr. W. Hepper, the president of the York Architectural Association."

Mr. Hepper, in returning thanks, said that it had given him and the York Architectural Association great pleasure to receive the Society of Architects in that city. The meetings that had been held would prove of great benefit to the architects in York through the interchange of ideas that had passed in the discussions. The Society of Architects was engaged in a great work in framing a Bill for the protection of the public from badly constructed dwellings. The system of visiting annually their professional brethren in the provinces was one which was greatly appreciated. It tended to promote professional harmony and the status of the profession, showing to the public at large the great interest that architects took in not only their own works, but in the works of the ancient masters of their profession.

The Society then left the Mansion House and proceeded to Heslington Hall, where they were received by Mr. Bateson de Yarburgh, who kindly conducted them over this very interesting Elizabethan building. In the evening the Society again met at the Church Institute, when the chair was taken by Mr. Sidney Marsland, of London, and a paper was read by Mr. Camidge, solicitor, on "Light and Air."

EDUCATION, CULTIVATION, AND EXAMINATION.*

(*Continued from page* 542.)

HAVING now considered general education, cultivation, and examination, I propose to pass to these subjects as they specially affect ourselves as students of architecture; and in approaching this division of the subject, I desire emphatically to point out that every architect ought to be a cultivated as well as an educated man. I shall have to point out later on that not a few of the studies and pursuits which to men in other stations are simply aids to cultivation, form part of the architect's special professional training; but apart from that, if he be not a man of cultivation, he will not do his duty well, and he will not properly occupy the position which a member of so liberal and responsible a profession ought to hold in society. You may perhaps remember that I said early in this lecture that "the object of education is to equip the student for the part he has to play on the stage of the world." If I can sketch for you the part which the architect should be prepared to play you will more readily comprehend the training he requires. Let us examine "the architect's part." There are three directions in which knowledge, skill, and experience are expected of him. (1) As to buildings and structure; (2) as to men and affairs; (3) as to drawings and art. And I propose to take these in their order.

I. An architect ought to be familiar with *buildings and structure*. He ought to know all sorts of buildings, their various purposes, and how those purposes are provided for—all that makes them suitable or unsuitable for use, and for any emergencies for which they ought to be prepared. He ought to know structure also—that is to say, all the materials of which buildings are usually made, their appearance, qualities, defects—the marks of goodness or badness in them, and the modes in which they are wrought, the work they will have to do in the structure, and their fitness for it. He ought to understand the sites and surroundings of buildings—drainage and sanitation, fittings and appliances, and should have mastered the scientific principles upon which such things as heating, ventilation, lightning conductors, and cooking apparatus should be arranged, as well as their practical details. He has to understand the decay and disruption of buildings, and the risks of decay and accident that beset them, and how to guard against such risks. Again, an architect ought to know something about the history of buildings, and the most important structures in the world. He ought to know the artistic principles upon which good buildings have been designed, and the forms, mouldings, enrichments, and features which have been to the great artists in architecture what the colours on his pallette are to the painter. And he ought to know by personal knowledge and experience, by measuring and drawing out in some cases, and by sketching and noting in others, a considerable amount of good architecture and good ornament, some of which ought to be from other countries than our own. And with some of this architecture he ought to be familiarly, nay, intimately, acquainted. Further, he requires to be at home upon buildings in course of construction, to foresee what is likely to be successful or otherwise, whether in arrangement, construction, or design; and to be able to correct defects and prevent mistakes, alike of design and of construction, before it be too late.

II. Again, the architect is required to know *men and affairs* as well as building. You will come to find, as you advance in life, that in every professional calling, as, indeed, in every important position in life, a knowledge of men is the most valuable of all acquisitions. Even the solitary student, or the lonely landscape painter works for others, and if he succeed it is either because his mind is so in harmony with the thoughts of his time that he involuntarily produces what others delight in, or else because his powers of calculation and observation enable him to take the measure, so to speak, of the men of his generation, and cleverly to produce (possibly without sympathy) some work sufficiently in harmony with the time to please them. Far more is it the case with ourselves, whose work is from first to last done in contact with our fellow creatures, that a knowledge of what men like and think and do is essential to success. The inception of any architectural undertaking grows out of the desire of other people to erect a building. The material carrying of it out is done by other hands than the architect's under the control of another head, often fuller of the desire to make money than to make a building; and the whole undertaking is beset by difficulties, emergencies, and varied transactions, in which the architect has to unravel one tangled skein after another with different people. In short, from that early stage in his career, when an architect has to establish his position, make a connection, and inspire confidence sufficient to induce persons to put their work into his hands, to the close of the transaction, when the last instalment of his own fees is paid him, he has need of tact, resource, a command of temper, presence of mind, good common sense, the ability to write a clear letter, and, in short, the qualities natural and acquired which enable a man to get on well with his fellow men. All this must be combined with a knowledge of affairs. All this intercourse with other people rises out of matters that have relation to the erection of buildings, the acquiring of site, or the materials of them, or the uses they are to be put to; or the laws affecting them, or the customs, or the prejudices, or conflicting interests of the folk who have to deal with them. Now, in every one of these things the architect or chief builder, if he is to be chief, must be sufficiently posted up to take the lead. He must be familiar with such of the forms of transacting business, correspondence, accounts, vouchers, &c., as are used in building affairs, and such laws, customs rights, as are incidents of, or affect his work, and, in addition, with an infinite number of things that bear on it only indirectly. Estimates, accounts, the value of the things that are used in making buildings, the value of buildings themselves, and of the land they stand on, road-making, repairs, light and air, the statute and common law as affecting buildings and property—on all these affairs he is expected to be able to give advice—and sound advice. He ought to know something about every use that a building can be put to, and though so much is almost unattainable, yet he ought to be constantly approaching to such a state of universal knowledge of what goes on under all roofs the longer he lives.

III. *Drawings and Art.* — We build our buildings on paper to an extent never hitherto practised, but rendered apparently necessary by the modern contract system; but more than this, we study with the pencil when we examine existing work. The pencil aids to develop and fix our ideas when we are designing; with the pencil we make our intentions clear to our clients, and at a later period to the surveyors who prepare the estimate, and the artisans who carry out the work. Drawing, then, is a most essential—the most essential of acquisitions for an architect. The best draughtsman may possibly never make an architect, though I do not think such a result need often occur; but no architect can hope to succeed at the present time who does not draw well, and is not familiar with all that ought to be and habitually is done in drawing out architectural designs, plans, and details, from first to last. Familiarity with plans is *not* a substitute for

* By Prof. T. Roger Smith, F.R.I.B.A. A public introductory lecture to the Classes in Architecture at University College, London, delivered on Wednesday night, Oct. 5, 1887.

familiarity with building, but it is an admirable introduction to buildings, and the best possible aid to the mastering of them. The draughtsmanship that is necessary will extend beyond familiarity with plan drawing. A good draughtsman must have so far mastered the use of his instruments as to be able to *think* through his bow pencil or his straight-edge, and he must be able to draw all the ornament in his buildings, including representations of the human figure, so that his drawings shall be serviceable guides to the workmen. He ought to have mastered perspective, and to be at home to some extent in colour. Finally, in the use of these means he should have the feeling and inspiration of the artist, and he should have sympathy with and a knowledge of other walks of art as well as his own. Art, which I have named last, on the principle on which the most famous performer is placed at the foot of a play-bill ("*and* Adelina Patti," for example) is that which determines the level at which our architect shall work. If he can be the artist in feeling and training, and in what he designs, his work may be noble architecture, and certainly will be good. Being an artist, be it remembered, relates to everything that develops a sense of beauty in form, line, and colour, and in all the allied arts as well as in our own. I need hardly point out that this considerable range of knowledge and experience will take years to acquire—in fact, it is the work of a lifetime; but what we are concerned with is that approach to it which justifies a beginning. This ideal portrait is not often, however—even if time enough be taken—carried out symmetrically and completely. Opportunity enables a man to accumulate experience, knowledge, and skill in one direction. The lack of opportunity, or of will, or of taste, cramps him in another, and so it comes to pass that most men are better in one walk of their profession than in another—fortunate if they are able to find that class of work for which they are most fit. In passing I ought to point out that more than one of the matters that figured in our enumeration of the cultivated man's acquisitions or methods are almost essential to the architect. This is especially the case with his drawing and his cultivation of the fine arts. He almost alone of all professional men should, as a matter of course, include foreign travel as a part of his training. He also, in common with all professional men, should cultivate his mind and powers by Bacon's method of reading, writing, and social intercourse. In short, he should be a cultivated man. I now turn to the standard which has been set up by the Royal Institute of British Architects as marking what they consider should be the attainments of a young architect before he is admitted as an Associate of that body. This standard we find set forth in the programme of the examination and in the specimen examination papers published, and though my statement is in less detail than the series of subjects of examination, you will find that those subjects group themselves under my broader headings perfectly well. My first heading is "Buildings." To the subjects which I embraced under this head the programme allots 400 out of the total of 700 marks, divided as under:—History of architecture, 100; mouldings, features, and ornaments, 100; sanitary science, strength of materials, shoring, 100; materials and construction, 100. You see that the largest demands—even when a deduction, which I shall come to directly, has been allowed—are made under this head. This is partly on account of the fundamental importance of a knowledge of buildings, and partly because fair opportunities for acquiring that knowledge are open to you in your student days. My second head was Men and Affairs. This comprises two heads in the examination programme, between which 100 marks are allotted. They are—Specifications and estimating, 75; professional practice, 25. The first of these two subjects most students can easily acquire, and skill in it can be readily tested by examination; but much of the knowledge comprised under the head of professional practice cannot be acquired till later in life, so but few marks are allotted to the subject; moreover, the skill, tact, self-possession and judgment needed for the transaction of business are not matters in which a candidate can be directly examined; though, as far as they come out in his *vivâ voce* examination, they will be sure to have a share in determining the result. My third head, Drawing and Art, is directly represented by one heading only, Plan, Section, and Elevation, to which 200 marks are allotted. Of course a proportion, which the programme does not disclose, of the marks allotted to the first group of subjects will be given to the sketches with which the answers are to be illustrated, and as far as they go, these marks would increase the proportion devoted to drawing and art at the expense of those devoted to knowledge of buildings; but it is not likely that this could ever take place to so great an extent as to equalise the two. This examination grows, as you know, out of the voluntary examination, which acted as a pioneeer to prepare the way. I had the honour of having some share in preparing the preliminaries of that examination, and am, alas! the only survivor of the five who acted as examiners and moderators on the first occasion, the others being Scott, Digby Wyatt, Ashpitel, and John Papworth. Some of those who organised and subsequently recast the scheme still remain, among them, I am happy to say, my immediate predecessor in this chair, Professor Hayter Lewis, to whose initiation as honorary secretary to the Institute, more than to the action of any other person, we owe it that to-day we have an entrance examination for Associates of the Institute. The advantages which it was considered that students would obtain were, first, that the programme would make it clear what direction in the opinion of persons qualified to judge an architect's studies and his preparation for the serious work of his profession, ought to take; and, secondly, that the examination itself would establish a standard of attainment which it is not unreasonable to expect that every student with the usual means of study at command shall reach before he looks upon himself as qualified to practise. The Institute by adopting this examination as the door through which every Associate must enter, has in one sense doubled the value of it, for it has added a double stimulus to work. Passing has always been a distinction; but now failure to pass entails a very serious professional disability. Of all things I should deprecate—and I think in this I should speak the feelings of the examiners and council generally—I should deprecate this examination being looked upon, or coming at any future day to be looked upon, as an arbitrary test. It is intended to be, and I think is so worked by the board who undertake it, as really to be a test of qualification. That is to say, a man is not held fit to be admitted to the Institute because he has passed the examinations, but because he has fitted himself to perform the duties of an architect, and the examiners will direct their questions so as to satisfy themselves of this fact only. Whenever, or if ever, the examination fails to keep up its character in this respect, if it admits what are called catch-questions, and sinks to the level, for example, of the Civil Service examinations, where a man is passed as a consequence of his having temporarily worked up certain subjects, it will fail of its real object. Consider, then, that your duty really is to prepare yourselves for practice, and that this examination is an incident in such preparation. And do not consider that you are to prepare yourselves for examination, and that if you can worry through you are sure to be right as far as fitness for your professional life goes.

(*To be continued.*)

THE ARCHITECTURAL ASSOCIATION CONVERSAZIONE.

THE new session of the Architectural Association was inaugurated on Friday night by a *conversazione* given by the President and Committee at the Westminster Town Hall. There was a large attendance of members and their lady friends, and the proceedings passed off pleasantly and successfully. Concerts given in the Council Chamber, and in which Miss Emily Lawson, Miss Amy Hickling, Miss Isabel Tomalin, and Messrs. D'Arcy Ferris, Malcolm Lawson, and Herbert Thorndike were the vocalists, and the string band of the 2nd Life Guards, conducted by Herr Carli Zoeller, which performed in the large hall, were the chief attractions of the evening; the precedent set in 1885 of abolishing the presidential address and prize distribution being followed, as last year. The President, Mr. John Slater, B.A., F.R.I.B.A., received his guests in the large hall, and during the evening read out the following list of awards of prizes for work executed by the members last session:—

Architectural Association Medal.—G. G. Woodward.
Architectural Union Company's Prize (for Measured Drawings).—1st, Arthur Webb; 2nd, H. P. Burke Downing.
Architectural Association Travelling Studentship.—A. H. Hart.
Aldwinckle Travelling Studentship.—W. Medlycott Duke.
Ernest Turner Prize.—H. C. A. Colvill.
Thomas Blashill Prize.—H. E. Mallet.
Lectures on History.—1st, not awarded; 2nd, F. L. Jones; 3rd, V. L. Jones.
Lectures on Construction.—1st, H. S. Wood; 2nd, H. G. Lidstone; 3rd, H. V. Lanchester; hon. mention, A. B. Yeates, H. Ermrich, and H. E. Mathews.
Class of Colour Decoration.—Prize, W. Deaves; hon. mention, H. V. Lanchester.
Class of Design.—1st, E. E. Bateman; 2nd, H. R. Applebee; 3rd, E. W. Monro.
Elementary Class of Design.—Section I.: 1st, R. D. Warry; 2nd, A. W. Jarvis; 3rd, H. Woodington; hon. mention, A. B. Yeates. Ditto., Section II.: 1st, A. W. Cleaver; 2nd, J. Ellwood; hon. mention, D. J. Blow and R. A. J. Bignell.
Advanced Class of Construction.—Prize, T. G. Aggitter.
Class of Construction.—1st, W. D. Gravell; 2nd, F. R. Oglesby.
Elementary Class of Construction.—1st, H. Ermrich; 2nd, A. W. Jarvis and L. V. Hunt, aeq.
Quantity Class.—1st, W. J. Bamber; 2nd, not awarded.

The loan exhibits of drawings and trade displays were more restricted in number than in most former years, but were of good quality. In the centre of the assembly hall was a Jubilee bust of the Queen, an excellent likeness, modelled by Conrad Dursler, executed by the Coalbrookdale Company, who also showed some gate panels designed by the late Bruce J. Talbert, a set of three panels representing the Village Blacksmith, works designed and modelled by the late Alfred Stevens, copies of the Warwick Vase in cast-iron, electro-bronzed, and other works. Messrs. Holland and Sons, of Mount-street, Grosvenor-square, exhibited also in the centre of the rooms, among other exhibits, a well-executed but somewhat heavy mahogany mantelpiece, of Jacobean character, intended for a house at Double Bay, Australia, and executed from designs by Mr. M. B. Adams; it formed the chief subject of an illustration of the entrance hall of the house in our issue of the 8th July last. Messrs. William Walker and Sons, of Bunhill-row, E.C., exhibited one of the Bloomsbury Economiser grates, constructed on the lines suggested by Dr. T. Pridgin Teale—an inexpensive form of fireplace readily adapted to the ordinary surroundings, and very saving of fuel. Messrs. Jeffrey and Co., of Islington, had hung examples of their wall papers, admirable in treatment, and specially designed. Messrs. George Jackson and Sons showed friezes and ceilings executed in their fibrous plaster, and near by were numerous cartoons for stained-glass windows, designed and executed by Messrs. Campbell, Smith, and Co., of Newman-street, W. In the gallery upstairs, which owing to the planning of the town-hall can only be reached by going through the open court at the rear, unprotected even by a verandah, were exhibits of firegrates, paperhangings and tapestries, and Mexican onyx.

The suite of first-floor rooms at the rear of the gallery were devoted to the display of drawings and designs. In the large end room and the next apartment were the premiated works executed in the several classes. Mr. Woodward's design for an entrance to a college quadrangle, to which the Association medal was awarded, was Tudor in style, and of the type familiar at Oxford and Cambridge. The measured drawings sent in in competition for the Architectural Union Company's prizes to which first place was awarded were a carefully executed set representing Buildwas Abbey, Salop, by Mr. Arthur Webb, and Mr. Burke Downing, who was placed second, was almost equal in merit in his illustrations of Lostwithiel Church. Another good set of drawings had been made of St. Mary Overie Church. Mr. A. H. Hart had deservedly gained the A.A. Travelling Studentship with a number of sketches of churches and other buildings in Bruges, Lierre, Aerschot, Malines, and other Belgian towns. The Aldwinckle Travelling Studentship was awarded to Mr. W. M. Duke, for drawings of Henry VII.'s Chapel, Westminster, and the doorway of Salisbury chapter-house. The premiated work in the Colour Decoration Class, by Mr. W. Deaves, representing the

internal treatment of a chancel, evinced a well-thought and harmonious scheme, and in neatness and in finish of execution was far in advance of the run of work executed in this class. A falling of in number of competitors is to be noted. The work to be done in the Elementary Class of Design was, as the President remarked, unusually good, especially in Section I., and it is satisfactory to hear that the attendance was the largest ever known in any class of the Association. In another room were hung numerous water-colour sketches at Mont St. Michel, Dol, Coutances, and other districts of Brittany by Mr. F. A. Masey (some of which are reproduced by us this week), Mr. W. H. Raffles' views in Norfolk, and other water-colour drawings, from Dinant and Aldeburgh, by Mr. Francis Miller; and a third room was devoted to architectural photographs, including Mr. J. L. Robinson's illustrations of the A.A. recent excursion in the neighbourhood of Bath; Messrs. Bedford Lemere and Co.'s examples of halls, and of the carvings in the Royal Architectural Museum; Mr. S. H. R. Salmon's views of Old London; and those of the Tinworth panels, shown by Messrs. Doulton and Co.

NOTES IN NORMANDY AND BRITTANY.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

LAST Easter the writer and some friends enjoyed two or three weeks' ramble in the above provinces, and were agreeably surprised to find even in the best known places much that was interesting and not hackneyed—if one took the trouble to look for it. This fact and the feeling that those who do not know the ground we covered may benefit somewhat by our experience must be our apology for perpetrating these notes.

Our programme upon setting out was Jersey, St. Malo, Dinan, Dol, Mont S. Michel, Coutances, Caen, Bayeux, Liseux, and Havre; but lack of time compelled us to finish our trip at Coutances, as will be seen. We found, however, in the first-named half-dozen places plenty to occupy our minds and pencils during the three weeks we were away.

To commence, we found little at Jersey save Orginel Castle at Gorrey, near St. Heliers. This is a fine ruin upon a rocky promontory, where the natural shape of the mount has been turned to such good account that it is hard to tell in places where the natural masonry ends and the artificial commences. It is well clothed with green, and offers a host of subjects for watercolour. (A full description of the castle may be found in Murray.)

From Jersey to St. Malo is a pleasant steamer trip of about two and a half hours. St. Malo is picturesquely situated, but there is little to note, so we crossed at once to Dinard, on the opposite side of the river's mouth, whence one can reach Dinan (eleven miles distant) either by diligence or by a steamer, which, during the summer months, ascends the river to that place.

The town is romantically situated on the right bank of a wooded gorge, and we found there enough to occupy us for several days. The church of S. Sauveur has a fine slated spire, and the Romanesque west front is interesting. It is of granite, worked in a wonderfully free manner, and has weathered beautifully in shades of pink and buff. There are two or three other slate spires in the town, all of which are graceful in form and charming in colour. That called the "Carrefour d'Horloge" is particularly fine. There are also plenty of quaint old houses on pillars, two or three of which I have sketched. The (?) 13th-century bridge crossing the river still remains. The entrance to the college is effective though Late, and if one takes the trouble to go inside there is a painted arched arcade, and a picturesque tower in the inner courtyard. In the Rue de Jerzual, which is a narrow, sleepy old street winding down from the crown of the hill to the riverside, many of the old industries, such as weaving, spinning, metal-working, &c., may be seen still carried on in a very quaint and ancient manner. Some of the original shop fronts remain, and several of the interiors reward exploration. The chimney-piece in my sketch was in the upper room of one of these. I have also noted the method of lighting in some of the streets, which, though primitive, seemed effectual, and was certainly picturesque. At the vilage of Lehon, about a mile off, were until lately the ruins of a fine 13th-century church, the doorway of which was illustrated in the A.A. Sketchbook a short time since. This church is now, unhappily, being restored, and all traces of its age are fast disappearing under the mason's chisel. The village church has a pretty flêche, and there are one or two old houses. A little further on is St. Esprit, where there is a curious Gothic crucifix granite, which I have noted. At Lamballe, 15 miles distant by rail, is an interesting church, with a wonderful porch, also illustrated some time back in the Sketchbook, and several charming old houses.

From Dinan to Dol is a railway journey of about 15 miles, occupying about 2½ hours. We found Dol a dull little town of 4,000 inhabitants, and with such a mournful and decayed appearance that, in spite of its architectural attractions, we were not sorry to leave it. It possesses a half-ruined cathedral, one or two desecrated Flamboyant churches, and a market-place surrounded by houses of almost every period from the 13th century downwards. A great many of these are carried on curiously-carved granite pillars, which apparently originally belonged to some earlier building. These pillars are to be found in many parts of the town, often beneath 15th and 16th century houses, and apparently belong to the 12th century or earlier. Those supporting the fine old house called the "Archbishop's Palace" I have sketched in detail. The "butchers'" and "haberdashers'" shops which I have also noted may serve as types of the sort of building in which Dol abounds. There is a small chateau of a common type, a few miles distant, of which the detached tower in the sketch is the best part remaining. From Dol to Pontorson is ten miles by rail, whence one takes diligence to Mont S. Michel.*

As we approached the mount from the shore its appearance in the twilight was most impressive, standing out in solitary grandeur against the evening sky. The tide being out, we had soon passed beneath its ancient gateways, and were bumping and rattling along the uneven street that led to our hotel. The street in this tiny "town" is singular in its character. It commences from the beach about 12ft. wide, but after a few twists combined with a sharp ascent it quickly contracts into steep flights of steps, each steeper and narrower than the last, until, after many turnings, it lands you at the splendid gateway so well known to most of us. My sketch is taken from the lower part of the street, just within the second gateway. It is needless to give here a detailed description of this delightful place with its almost perfect Mediæval walls and bastions, its curious and interesting houses, and, above all, the magnificent pile that crowns the whole. The exquisite colours of the granite, of which the principal buildings are composed, offer a strong temptation to throw away the pencil for the brush. The visitor is strongly advised to purchase Mr. ——'s famous book, which treats exhaustively of the place, and a small edition of which can be there purchased for a few francs. The two caps sketched occur in some vaults beneath the earlier buildings on the S. side. In each case the light is let through narrow openings in the vaulting, so that it falls upon the cap, leaving the remainder of the chamber in comparative darkness, and producing a brilliant effect of light and shade. The little church is curiously adapted to meet the necessity for economising space which here exists. One of the "streets" is carried by a vaulted passage beneath its chancel, further space being gained by the corbelling out of the east wall. A similar device is shown in the next sketch, together with a window seat in the castle, the well-house on the beach, and a corner of the "Merveille." The chimney-piece is one of two in the famous Salle de Chevaliers. For permission to sketch, a polite application to the "Gardien" produced the desired effect. After a week's stay here, we left with many regrets, and took train to Coutances, distant about 40 miles.

Coutances is finely situated on the brow of a well-wooded hill, and its cathedral and churches form a splendid group on approaching it from the railway station. We made a successful attempt to reach this place on Easter Day, and were well rewarded for our trouble, as the old town looked its best on this important occasion. Those who cared for character or colour studies here enjoyed a double treat. Inside the cathedral we looked upon an ever-changing crowd of picturesque peasant worshippers, and a gorgeous show of priestly splendour; while outside the Easter fair, in the marketplace, produced a bewildering impression, in which huge coloured umbrellas, snowy and many-shaped caps, fine bronzed faces, blouses of every hue, wooden shoes, and ceaseless chatter all played their respective parts. The noble grey towers of the cathedral made a splendid background to the scene, and the sun shone in full brilliance over the whole. The cathedral is of course the great attraction, with its unique lantern and western spires. A good view of these last is obtained in the street whence my sketch is taken. Lower down this street is the fine church of St. Pierre (M.H.), of which an able drawing by Mr. M. B. Adams lately appeared in the BUILDING NEWS. This church suffers somewhat from the proximity of its still finer neighbour, and by itself would be quite sufficient to make a town's reputation. It is principally of the 15th century; the tower and lantern are in their way superb, the source of the latter's inspiration being evident. There are also several other churches of lesser note. Of Domestic work, Coutances at first sight discloses but little, a careful search, however, revealing several interesting remains. The old houses are generally of stone, and are built around a courtyard, in one corner of which is situated a conical roofed stair turret. One of the finest of these I have sketched. In a street nearly facing the west-end of the church of St. Pierre are the two old houses with corbelled bays, and nearly opposite them that with the angle staircase turret. About two miles from the town is the small chateau of Gratôt, which is a very perfect ruin, and is not mentioned in Murray. The outer walls are nearly complete, there is a fine moat still filled with water, and gateways, residence, &c. Lack of time prevented my sketching it, and necessitated the abrupt finish of my tour, and therefore my notes, at this point.

FRANCIS MASEY.

* Illustrations and plans of the Abbey and Mount, by the late Viollet le-Duc, appeared in the BUILDING NEWS for July 14 and Aug. 4, 1871, and a sketch of the staircase to the churchyard, a general view, and plan of Mount, by Mr. E J. JACKSON, in our issue of July 25, 1884.

CHIPS.

On Friday the workmen employed on the Jubilee tower and spire at Stockbridge Church, Hants, sat down to supper at the Vine Hotel. Mr. Ernest Ware, clerk of the works, presided, supported by Mr. H. Rann, foreman. The company drank to the healths of Messrs. Colson and Sons, architects, Winchester; Messrs. J. Crook and Sons, contractors, Northam, Southampton; Mr. E. Ware, and Mr. H. Rann.

Mr. Arnold Taylor, one of the inspectors under the Local Government Board, held an inquiry at the Guildhall, Canterbury, on Friday, for the purpose of inquiring into the application of the Canterbury town council for permission to raise a loan of £5,500 for purposes of street widening at High-street, construction of a new road from Pound-lane to North-lane, and for works of flood prevention. The city surveyor (Mr. Baker), Mr. Jennings (the author of the plans for the proposed improvements), and others gave evidence in support of the proposals.

The following were the winners of the various scholarships and studentships competed for at the City and Guilds of London Institute on Thursday the 6th inst.:—Holl Scholarship: P. R. Jones, Middle Class School, Cowper-street, E.C. Saddlers' Company's Studentships: W. E. Allen, United Westminster Schools, previously educated at St. Thomas, Charterhouse School. Mitchell Scholarships: T. W. M. Bull, F. Gaywood, F. H. Hummel, J. J. Nisbet, all of the Middle Class School, Cowper-street.

Aston Chapel, near Oswestry, was reopened on Tuesday week, after restoration, at a cost of £1,400, borne by Col. R. T. Lloyd. Mr. A. E. Street, M.A., of London, was the architect, and Mr. Yates, of Shifnal, the builder. The roof was formerly slated, and plastered internally, but is now boarded, and covered with red tiles, supplied by Mr. J. C. Edwards, of Ruabon. This work was carried out by the men employed on the estate, under the direction of Mr. Higley, the bailiff.

A new Liberal Club in Buchanan-street, Glasgow, was opened on the 5th inst. Mr. Alexander Skirving, of that city, was the architect; and Messrs. A. and R. Anderson the builders.

SKETCHES IN NORMANDY AND BRITTANY.—BEDFORD TOWN AND COUNTY CLUB.—PORTLAND MANSION WEST KENSINGTON.—BYRKLEY LODGE, STAFFORDSHIRE.—MISSION ROOM AT MAIDSTONE.—CHURCH OF ST. JOHN, MIDDLESBROUGH.—THE GRANGETOWN HOTEL.

OUR LITHOGRAPHIC ILLUSTRATIONS.

SKETCHES IN NORMANDY AND BRITTANY.

For description, see p. 575.

BEDFORD TOWN AND COUNTY CLUB.

The committee for the above building some four years back advertised for architects' names willing to compete for the erection of their new premises on the bank of the Ouse, and out of upwards of 200 applications, 13 gentlemen were selected, out of whose plans those we illustrate this day were chosen. A special feature required was that ample balcony accommodation should be provided, so that regattas, &c., on the river might be viewed by the members, the site being particularly well placed for this purpose. Another difficulty in the arrangement was that no windows should overlook the Duke of Bedford's grounds to the right of site. The materials are red bricks, with Bath stone dressings, which have a very good effect, as combined with the half-timbered work in upper stages. Considerable difficulty was experienced with the foundations, they having to be taken down in concrete from 20ft. to 25ft. deep along the whole front of the building, and for a considerable distance back, the solid ground shelving towards the river, believed to be the site of the old castle moat, but more probably the former bed of the river, on which the ground had been made up. Notwithstanding the extra expense the building was finished complete for rather less than £4,000.

PORTLAND MANSION, WEST KENSINGTON, W.

This block of residential chambers has lately been erected at Portland-place, West Kensington. It contains eight suites of apartments, each consisting of four rooms, with bathroom and w.c., and has been designed to meet an increasing demand for small, self-contained residences. Each suite has a separate large coal-cellar in the basement, and a double lift for provisions is constructed from the basement to the third floor, while tradesmen communicate with the flats through speaking tubes from the basement. Lindsay's fireproof flooring has been used throughout the building, the lifts and electric-bells are by Messrs. Adams and Sons, of the Haymarket, and the wrought-iron work is by Messrs. Singer and Sons, of Frome. Although the whole building only occupies the space of two small houses, at least four times the number of people who occupied the old houses can be, and are, comfortably housed at a cheaper rate in a soundly-built and well-drained building, which in these utilitarian times is a powerful argument in favour of the foreign system of flats, and against our insular prejudice for jerry-built and uncomfortably-planned houses. Co-operation is the secret of efficiency. The front is faced with red bricks and gauged brick arches, and Doulting stone bands and voussoirs, and the roof is tiled. The building has been well built by Messrs. Stimpson and Co., Mr. Hawkins being clerk of the works, and the architects Messrs. Lewen-Sharp and Arpen, of 3, Duke-street, Adelphi, W.C. The total cost was £5,500.

BYRKLEY LODGE, STAFFORDSHIRE.

This house, now in course of building, is for Mr. Hamar Bass, M.P., on an estate in Staffordshire. The walls are of brick with stone dressings, and the roofs are covered with slates. The plans show the extent of the mansion; but we have received no descriptive particulars from the architect, Mr. R. W. Edis, F.S.A. Our illustration is from a drawing which was hung in this year's Royal Academy Exhibition.

NEW MISSION ROOM, ST. PAUL'S, MAIDSTONE.

In this wooden structure a not unsuccessful attempt has been made to compete with the galvanised iron usually employed for similar buildings, while superior artistic effect may with good reason be claimed for it. The building will accommodate 330, and the cost, exclusive of class room, was £620, the amount per sitting being thus under £2. The material employed for the framing, which shows both externally and internally, is fir, unwrought and dressed with creosote, the tenons and mortices being saturated, the panels are of plaster on laths nailed to fillets, the external work being in selenitic cement, which is of a warm tint. The roof is of green slate "ladies" size on 1¼in. boarding covered with waterproof paper, and carried by purlins about 5ft. apart. Mr. Hubert Bensted, of Maidstone, was the architect.

CHURCH OF ST. JOHN, SOUTH BANK, MIDDLESBROUGH-ON-TEES.

The design illustrated is the selected one for the above by a professional assessor out of six sets of plans sent in competition. The accommodation provided is for 650 adults. The cost is £4,000, exclusive of tower. Mr. J. Mitchell Bottomley, of Middlesbrough-on-Tees, is the architect.

GRANGETOWN HOTEL, NEAR MIDDLESBROUGH.

The village of Grangetown consists of upwards of 800 houses, occupied exclusively by the workmen engaged in the extensive iron-works of Messrs. Bolckow, Vaughan, and Co., together with the shops and other buildings necessary for such a community. The hotel, of which an illustration is given, is the only place in which any intoxicant is allowed to be sold. It has been built for Mr. James Eadie, of the Cross-street Brewery, Burton-on-Trent, from designs of Mr. J. Mitchell Bottomley, of Middlesbrough-on-Tees. The original building was erected by Mr. James Maddocks, of Burton-on-Trent, and subsequent alterations and enlargements by Mr. Thomas Dickinson, of Saltburn-by-the-Sea. The total cost, exclusive of site, has been about £5,500.

A "children's window" was unveiled at St. Matthew's Church, Walsall, last week. The window, which has been executed by Messrs. Burlison and Grylls, London, shows in the three lower lights representations of the "Presentation in the Temple," "Christ in the Temple," and "Childhood in the Carpenter's Shop at Nazareth," and the upper part is filled with presentments of the saints of children—SS. Katherine, Nicholas, John the Baptist, Christopher, and Agnes—and the patron saint of the church (St. Matthew).

Some unpleasant information as to the condition of their town hall was imparted to the Rochdale town council at their last meeting. The building has recently been surveyed, and found to require re-roofing almost at once. In other directions extensive repairs are needed; and Alderman Schofield told the council that it might be necessary almost to rebuild the hall, which was only completed sixteen years ago at a cost of over £150,000. Alderman Barron openly blamed the contractors for this unsatisfactory state of things, and said one contractor avowed that he "scamped" his work at every opportunity.

The Tunbridge Wells local board have accepted from their chairman a gift of four acres of land at the northern end of the town for a recreation ground. It will be laid out and fenced in, in accordance with plans prepared by Mr. R. Marnock, at a cost, including lodges, of £2,500.

CORPUS CHRISTI CHURCH, BRIXTON.

This fine church, of which we give a drawing to-day, has been erected on the right-hand side of Brixton-rise, nearly opposite Raleigh House. It is of red brick and stone, and the only portion now complete is the chancel, which cost £5,365. Internally, the height is about 62ft. to the crown of the vault. The ceiling is of vaulted construction, with ribs, and has a very fine effect. The Architectural Association (with the kind permission of Mr. Bentley, the architect), visited the church on March 5th last, and in our issue of March 11th we gave a plan of the church. Messrs. Lawrence and Son, of City-road, are the builders.

WANDSWORTH MANOR HOUSE.

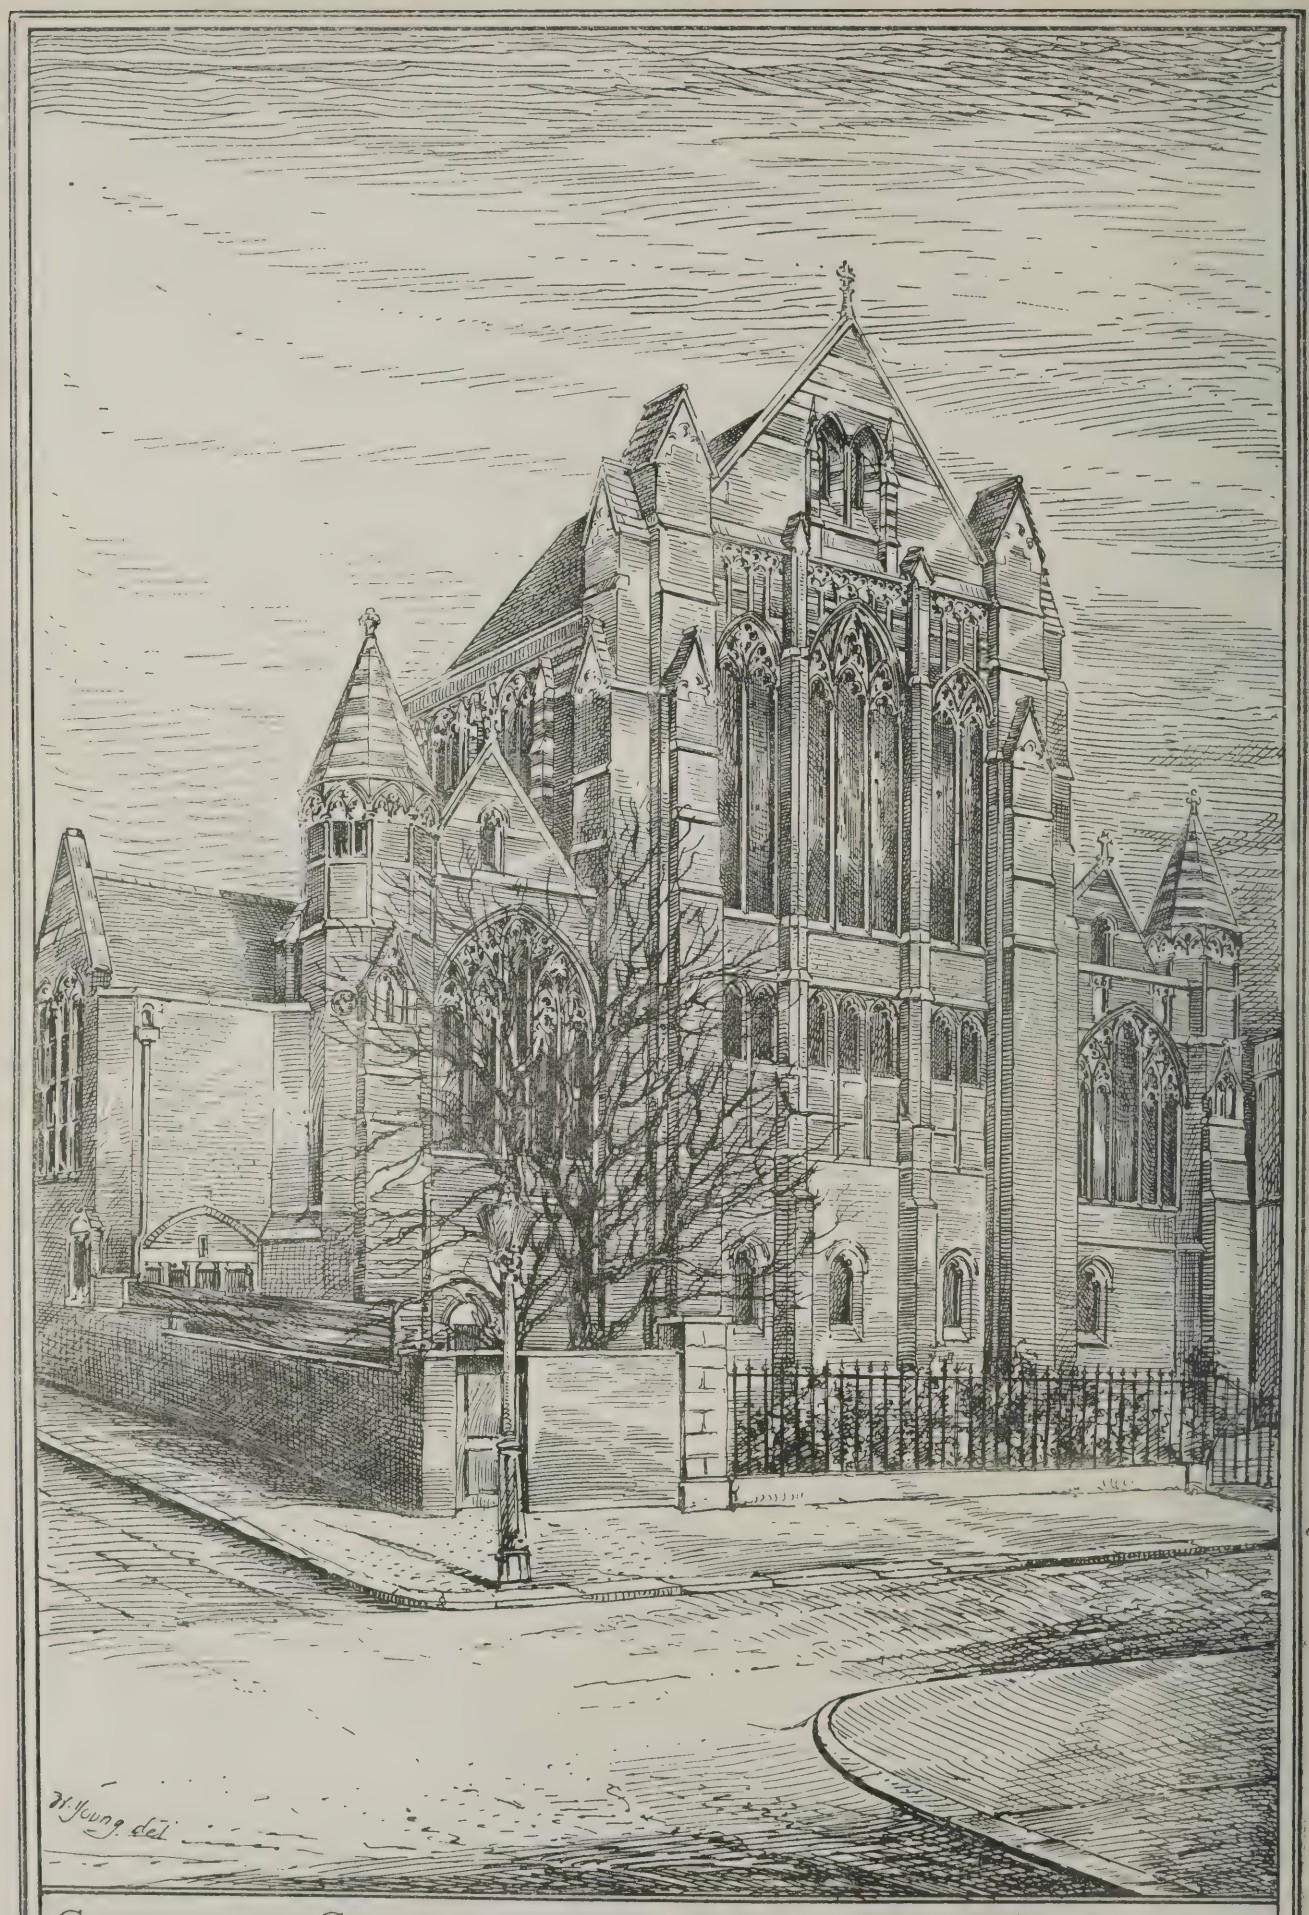
We illustrate to-day a view taken from the garden of the above famous house which is threatened with demolition. The estate on which the Manor House stands is rapidly being developed from a speculating builder's point of view. The house was designed by Sir Christopher Wren, and was presented by Charles II. to his niece, Princess Anne of York, on her marriage with Prince George of Denmark. Beneath the centre gable are still the Royal Arms, and the staircase and hall (of which we hope to give a sketch in a future number) are of oak, and beautifully carved and panelled; Sir James Thornhill has painted many of the panels. The house is at present used as a young ladies' seminary. It is in very good condition, hardly any decay showing itself. The iron staircase to the garden is a good piece of work, and the door leading from the hall has much good detail. The screen across the hall is divided into three bays by Corinthian columns, and above this is some very rich carving in the style of Grinling Gibbons. On the first floor in one of the panels is a portrait of Anne Hyde. We believe some meetings have already been held to prevent this interesting old building from being pulled down, and endeavours are also being made to buy it for conversion into a club. There are about three acres of ground attached, and some fine old trees thereon, and we hope the promoters of this scheme may be successful, as it would be a great pity for such an historical old place to disappear.

CHIPS.

The local board of Southend-on-Sea have elected as town surveyor, Mr. Peter Dodd, for the past six years assistant surveyor to the Tunbridge Wells local board, and previously assistant borough surveyor of Blackpool.

Mr. A. S. Murray, LL.D., keeper of the Greek and Roman antiquities in the British Museum, will commence on the 21st, in Edinburgh, a course of Rhind lectures on Greek archæology.

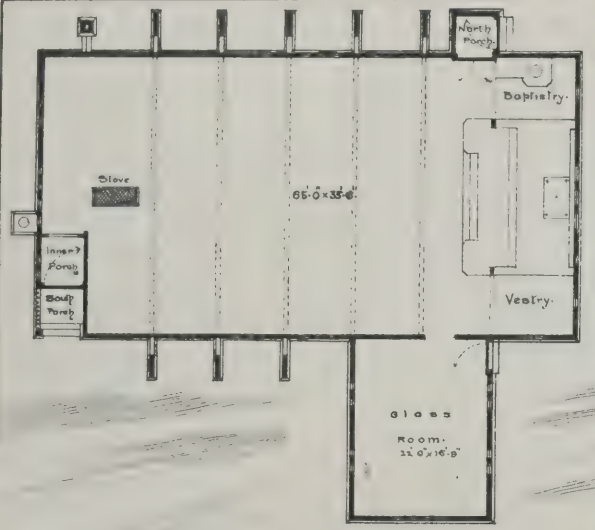
A loan exhibition of works by Suffolk artists is now on view at the Ipswich Fine Art Gallery, and is regarded as the best local exhibition of pictures yet brought together in the Eastern Counties. Seventeen works have been lent by the Queen, and the collection includes examples of Constable and Gainsborough.



Mr. D. Cowan, manager of the Carron Iron Company, has been appointed a justice of the peace for the county of Stirling.

Ten acres of land have been acquired at Erith as a site for a factory for the manufacture of Nordenfelt guns and ammunition. The site is situate between the Erith Recreation-ground and the line of the South-Eastern Railway, the latter having a branch into the Royal Arsenal, where a large Nordenfelt shop has been recently erected. The new factory will be contiguous to, but outside the boundaries of, the Royal Arsenal.

The Dick's Royal Veterinary College, Edinburgh, was reopened by the Lord Provost of that city on the 5th inst., after having been reconstructed from plans by Mr. Morham, at a cost of £5,000.



The massive terracotta ornament, representing Milo the Cretan, which has for many years hung over the entrance to the Queen's Hotel in St. Martin's-le-Grand, has been presented by the Postmaster-General to the Library Committee of the City Corporation.

The ornithological collection and library, formerly belonging to the late Marquis of Tweeddale, has been presented by Captain Wardlaw Ramsey, with additions of his own, to the Natural History Museum at South Kensington. The value of the collection is estimated at about £15,000.

WANDSWORTH MANOR HOUSE.—Sir Christopher Wren, *Architect.*

UNIVERSITY OF ILLINOIS

WAYSIDE NOTES.

THERE is nothing new on earth, it is said, and when I read the opening remarks of Professor Roger Smith on "Education, Cultivation, and Examination" I feel somewhat inclined to believe that the saying is indeed a truism, and that it is only in men's own imaginations that new facts and fresh discoveries are made. The Professor referred to some words of the recently appointed President of the Architectural Association, of this import:—"A most important discovery has been made within this last few years, that one necessity for an architect is a thorough education, and the results of this discovery must have very far-reaching effects on the profession." A very new discovery, indeed, and one made in very recent years, truly!

Was there not, at one time of the world's history, a certain architect of Italy—one Marcus Vitruvius Pollio—who left for our edification a lengthy treatise on building matters, which he, with exemplary modesty, designated *De Architectura?* And is there not therein contained a few rather enlarged notions as to the proper qualifications for the young architect? Where, then, is the newness of the discovery, seeing that the said Vitruvius is supposed to have been born about 76 or 80 B.C.?

Later in the Professor's discourse I read that it is preferable for the young architect to travel for six months consecutively than to roam afield six different times for one month each. The Professor said that he had not then time to explain the why and wherefore of this remarkable dictum. This is certainly a great pity, as the notion is so opposed to that of many architects of the present day that it would have been only just to have given us the reason. If Professor Roger Smith would kindly explain, many of us might be put right.

One would have thought that the notion of a "grand tour" was exploded long ago. To send a young student away for years at the expiration of his articles would often be ruination to him. He would be simply fit for nothing at all. He can get quite rusty enough and unpractical enough without his being sent away for years to get out of his business habits, and, moreover, to become *blasé* of all architecture and sketching, and wholly incapable of sitting still for two minutes together in an office. Far better for the young architect to run away for a *few* weeks at a time, when his occupation allows of him doing so. He will infallibly learn more, and would not get out of every valuable business habit.

Much indignation has been expressed at the proposed action of the authorities in regard to the old Millbank Prison and the consequent contemplated alterations in the arrangements at Wormwood Scrubs. As far as I understand, the later place—formerly used only for convicts—is to be in future employed as a common gaol; and the inhabitants of the district are naturally much perturbed at the idea. Meantime, it is rumoured, the forbidding mass of brickwork on the river at Millbank is to be pulled down to make way for artisans' dwellings.

It certainly cannot be very delightful for the residents in the north-west of London to have to look forward to a time when bands of short-term gaol-birds will be daily let loose in their neighbourhood. Neither, however, I should imagine, it is very pleasant for the miserable wretches themselves, who, from the confinement of dismal cells, are thrown upon an unforgiving world, to so often but find themselves once more compelled to thieve and steal to satisfy their cravings for food.

On Saturday night last, at an indignation meeting at Shepherd's-bush, a resolution was passed condemning the scheme. And it must be confessed it does seem unnecessary, and there is no doubt the proposed alterations at Wormwood Scrubs Prison would somewhat injure the immediate district. One would think there would be plenty of gaol accommodation elsewhere, even if Millbank were destroyed.

On the same day as the worthy folk of Shepherd's-bush vented their indignation in the St. Luke's Schools, the managers of the Metropolitan Asylums District held a meeting at the offices of the Metropolitan Board of Works, under the presidency of Sir E. H. Galsworthy. As may be supposed, the discussion was all anent the "epidemic" of scarlet fever. During the meeting Captain Wiltshire expressed a hope that the Board would obtain power to enforce the compulsory removal of infected children where the parents demurred to their treatment in a hospital.

"*Run 'em in*," in fact, would appear to be the motto of the asylum people; and whilst officials are ferreting about for cases, there is no doubt they will turn out a goodly number of fever-stricken individuals. This is all very right and proper, only, under such circumstances, is it fair to the public to talk about an epidemic, and thus raise undue alarm? By all means let as many fever cases as possible be ferreted for and "run in," but do not let us talk about "epidemics."

The Metropolitan Board of Works has been distinguishing itself, says the *Times*. So it has.

I tender my best thanks, and those of the readers of the "B.N.," to "One Who Knows" for his timely information about the house of Kent that so fascinated the King of the Belgians. His Majesty seems to have conceived a strong affection for modern English Domestic architecture what with this, and the reports as to his doings at Eastbourne.

I hear that the Architectural Association Conversazione was a great success: good company, good music, and liberal refreshments in fine rooms. "Circumstances over which I had no," or little, "control" prevented my attendance, so cannot enlarge upon the theme.

Fine weather appears, after all, to have favoured the Society of Architects at York. It is pleasant to follow the excursionists, in one's imagination, on the enjoyable visits. Mr. Hugh Roumieu Gough's paper should help on the Registration movement. I regret to see that the committee lack funds. Now is the time for the advocates of the scheme to show that they are in earnest.

Feeling very interested in the Celtic remains at Carnac, in Brittany, I consulted Fergusson, and find that in his "Rude Stone Monuments" there are some eleven pages of letterpress and illustrations devoted to Carnac. These curious remains are thus described:—"In a zone about twenty miles in extent, stretching from Erdeven on the north-west to Tumiac in a south-easterly direction, and nowhere more than five miles in width, there is to be found the most remarkable group of megalithic remains, not only in France, but perhaps the whole world. Not only are examples of every class of monument we have been describing, except circles, to be found there; but they are larger and finer examples than are generally to be met with elsewhere. Another point of interest also is that within the zone are found, if I am not mistaken, both a cemetery and a battle-field."

Mr. Fergusson, in considering the question of the possible age of these stones, brings forward an argument to show that they are, at any rate, later than Cæsar's time, which, if not conclusive, is, at any rate, curious and interesting. He says that "when Cæsar and his army witnessed the fight between his galleys and the fleet of the Morbihan, he must have stood, if he occupied the best position, on Mont St. Michel (a tumulus near Carnac), if it then existed, and amongst the stone avenues of Carnac." From this fact Mr. Fergusson draws the conclusion that they could not have existed at the time of battle, as, he says, Cæsar would certainly not have omitted to heighten the effect of his description of the fight by describing the appearance of the vast white monoliths surrounding him in all their solitary grandeur.

GOTH.

The City Corporation negatived, at their last meeting, a proposal made by Messrs. H. Clarke and H. H. Bridgman, F.R.I.B.A., that they should appropriate funds for the establishment of an art gallery and school of design.

THE LONDON COLLEGE OF ARCHITECTURE.

THIS college, which has just been established at 46, Great Ormond-street, for the purpose of affording to students of architecture and surveying the advantage of thorough practical, scientific, and artistic education in all the branches of the profession, seems to us likely to supply a great want if properly conducted. As the directors point out, the functions of the modern architect now require technical instruction—which has no place in the ordinary office routine—and an artistic education, which cannot be acquired in the ordinarily recognised schools of applied science. The London College of Architecture is to be devoted to securing the combination of these necessary elements. It is especially the endeavour of the directorate to systematically prepare the students for all subjects required in the compulsory examination for membership of the Royal Institute of British Architects; for district and municipal surveyorships; the architectural Governmental appointments; and for actual practice, or subordinate positions in the offices of other architects.

The curriculum provides lectures and individual instruction in the scientific section on mathematics and mechanics, plane and descriptive geometry, stereotomy, &c., surveying and levelling, chemistry (the chemistry of building materials, &c.), geology and physiography, physics, and building construction. In the artistic section the subjects taken will be the history of architecture, drawing, architectural styles, forms, and details, designing architecture, colour decoration and decorative art generally, and the study of ancient buildings.

General professional practice will embrace the principles and practice of building contracts, and the settlement of building accounts; specifications, and the drawing up of general reports; quantities and estimates; light and air, compensation, dilapidation, arbitration, and valuation; sanitation, including drainage, warming, and ventilation; the Metropolitan Building Act, and the duties of building surveyors under local authorities; dangerous structures.

Students whose time is partially occupied can attend any of the special day or evening classes they choose, either for general study or for preparation for the different architectural and surveying examinations.

Periodical visits will be made under the guidance of the principals to well-known examples of ancient and modern art. The College being in close proximity to the British Museum, the students will be enabled thereby to avail themselves of the valuable library and collection of examples of ancient art.

The terms seem reasonable; the directors, Messrs. A. Hessell Tiltman and W. Henry Wood, are both gentlemen well known in the profession, and we hope their scheme may find due encouragement as long as it is likely to improve young architects, and consequently the status of their vocation.

VERESTCHAGIN'S PICTURES AT THE GROSVENOR GALLERY.

AN exhibition of studies and pictures, chiefly of Palestine, of India, and of scenes in the Russo-Turkish War, painted by Vassili Verestchagin, a Russian painter, who has been himself a great traveller, is now on view at the Grosvenor Gallery. Those who expect to find a collection of paintings, such as the visitor to the Grosvenor Gallery is accustomed to see, will be disappointed. They must not look for the manifestations of Academical culture or of that kind of impressionism which we have been wont to see at Sir Coutts Lindsay's Gallery. Verestchagin is essentially a hard-working painter of the realistic and sterner side of nature; his great merit is his individuality. When he paints a face he gives us exactly what he sees—nothing more. The strong lineaments of character are shown in all his portraits of Arabs, Rabbis, and Greeks, as in that of a Jewish Rabbi from the western provinces of Russia, and in the series of Russian types in the smaller gallery. When he paints a battlefield he does not throw a veil of smoke over the combatants nor group his masses for effect, but he details with almost photographic minuteness the agonies of the

wounded and the dying. He tells the whole truth of the "bloody sport of Kings." We, however, turn first with more interest to some congenial subjects in the large gallery, among which we must notice "The Gate of Allah-Uddin in Ancient Delhi," a red sandstone gateway with a group of court attendants; also a large view of "The Window of Akbar's Monument," a remarkable and delicate piece of white marble tracery; some striking evening views of the Taj, a monument well known as an erection by the Great Mogul Shah Jihan, over the grave of his favourite wife. It is entirely of white marble, enriched with inlays of lapis lazuli, malachite, cornelian, and other precious stones. The dazzling whiteness and splendour of its architecture is contrasted by the dark cypress and other foliage. In one view the dome is reflected in the still water of the river; in the other, the artist has shown the view of the Taj from the garden. The "House of Raja Berbue, near Agra," and the "Chief Mosque in Futtehpore Sikri" (56) are elaborate studies of the delicately-carved architecture of India. With their shortcomings as works of the painter, we must allow that the artist has given us impressions fairly accurate in the details of these wonderfully-wrought examples of architecture.

M. Verestchagin is even stronger in his battlefields. The pictures illustrating the Russo-Turkish war are powerful as technical representations. He followed the armies to the field, and as a soldier-artist has rendered what he saw. The artist, it appears, was wounded in the war; but has, nevertheless, shown great perseverance, and one must credit him with indomitable energy, at least. The principal scenes he has depicted are "Skobelef at Shipka" (75) in the small room. Skobelef is galloping down the line of his soldiers, thanking them for the victory. M. Verestchagin has painted with realistic power and a wonderful technique the snow-clad scene with the heaps of dead before the Turkish forts. No. 79, "Before the Attack," is another touching incident of the storming of Plevna—the troops lying down waiting the order for the assault, a more solidly-painted work. The Turkish Hospital at Plevna, a dark interior, with the ghastly forms of still breathing and wounded men (83), is painful in its reality. "After the Battle" (81), "Alexander II. before Plevna," and the figure-studies and incidents, are interesting records of a miserable war. Sometimes there is a likeness to the work of Meissonier; occasionally we see Courbet; but on the whole, Verestchagin's work is eminently characteristic of the painter himself.

FOUNDATIONS.

THE first lecture of the session at the City of London College in Civil Engineering was given by Mr. Henry Adams, M.Inst.C.E., on Wednesday last, upon the subject of foundations. He said that when it was necessary to spread the pressure at the base of a wall, in order that some less resisting material below might support the weight of the superstructure, it would at first sight appear that, by using the bricks as all headers, footing courses with projections of 4½in. might be adopted; but these would be apt to break off, a brick being most easily broken across its middle, and it was found that not more than a 2¼in. projection of each course beyond the one above it could be adopted as practically safe, and at the same time convenient. This gives an angle of 53° 3′ from the horizontal for the line of transmission of the pressure, and shows that the ordinary allowance of 60° in calculations leaves a slight additional margin of safety. Concrete has less "bond" than brickwork, and hence in lime concrete the projection beyond the base of the footings should not exceed ⅔ of the depths in running lengths; but in a square bed, as at the base of a factory chimney, additional support is derived from the corners, and the projection may be made equal to the depth; less than this is liable to have a hole punched through it by the brickwork. In cement concrete the mass may be looked upon as homogeneous, and the projection made equal to the depth for running lengths, or 1⅓ times the depth for square beds. The least depth of foundations below the surface should be 3ft. in sand and 4ft. in clay, to avoid the effects of frost. The following list was given showing the maximum safe loads per square foot in foundations under ordinary circumstances — viz., stock brickwork in mortar, 6 tons; cement concrete, 6 tons; hard gravel and deep solid clay, 5 tons; lias lime concrete, 4 tons; stone lime concrete, 3 tons; good gravel soil, 3 tons; ordinary solid earth, 1½ ton; bad ground, ¾ ton.

The subject for next week is "The Use of Piling in Foundations."

THE BIRMINGHAM BY-LAWS.

AS we hinted last week, the Town Council of Birmingham have adopted the new code of by-laws with respect to new streets, courts, and buildings, upon which they have been for some time engaged. For a considerable time past Birmingham has suffered from imperfect building legislation. Many of the old by-laws were badly framed; others were not clear; and the rest were obsolete or contradictory. Such a state of confusion could no longer be endured, and we must congratulate the authorities on having accomplished so necessary and urgent a measure of reform. When the Consolidation Act was framed, powers were given to make new by-laws in substitution of the old ones, and these refer to courts, unhealthy sites, dangerous staircases, chimney-stacks, the thickness of the walls of ovens and furnaces, and the prohibition of the use of rooms over privies. We have always urged the desirability of provincial towns framing their by-laws to meet local peculiarities and conditions, and the public works committee intrusted with the preparation of the code have found it necessary to frame the new by-laws independently of the Model By-laws of the Local Government Board. That authority, after a little consideration, agreed to most of the clauses. The new code has also been discussed by the Birmingham Architectural Association and the Master Builders' Association, who were consulted, so that it may be said to embody the requirements of all concerned.

As we have received a draft copy of these by-laws, it may be of interest to refer to some of the clauses, pointing out a few of the special features. The first of importance relates to foundations. By-law 5 says: "A person who shall erect a new building shall not construct any foundation of such building upon any site which shall have been filled up with any offensive or unwholesome waste or refuse, or with any material impregnated with fæcal matter, &c., &c." This clause in the main reads the same as that in the Model By-laws, though it is amplified in one or two points. The words, "any offensive or unwholesome waste or refuse" are an addition, making it more general in its application. In the report of the committee's discussion on these by-laws, one member asked whether this meant that the whole piece of ground should be excavated, or that only the refuse should be properly removed from such site, and Mr. Parker said that it was only the foundation which was affected by the by-law. If by the word "foundation" he meant only the trenches for the footings, it would be optional for any one merely to remove the injurious soil from the trenches, and to allow the site below the living rooms to remain hotbeds of disease, covered only by a layer of concrete. We presume this construction can never be intended, and if not, the clause is by no means clear. The building sites in Birmingham have all been at one time or another covered by refuse or fæcal soil. On this ground it is more necessary that a comprehensive and stringent by-law be passed, for as Alderman Avery pointed out, there have been numerous cases of disease having broken out in houses which were found to be entirely attributable to the unwholesome condition of the soil. There is a qualifying condition in the next by-law which destroys its power for good. The Model By-law is to the effect that every site is to be covered with concrete or asphalted; but the new by-law reads "in every case in which the dampness of the soil of the ground or the ground surface shall render this precaution necessary." This qualification is, to our mind, weakening, and renders it possible to evade the true intention of the framers. How is the "dampness of the soil" to be judged? It may look dry on the surface, but be sodden beyond. When is the precaution to be deemed necessary? As it stands, the clause courts difference of opinion, and seems to have been framed to meet the old order of things. A layer of concrete, or of asphalte, seems to be imperatively required, when we consider that only foundations of new buildings are to be excavated. We fail to see under the provisions for external walls any reference to hollow or half-timber walls, though in Birmingham there is less need for them. The by-laws as to cross walls and the materials to be used are taken from the model code. Clause 9 restricts all projections, even those intended for the purpose of architectural ornament, to 12in. By-laws 10, 11, 12, 13 agree with Nos. 14 to 17 in the model set, referring to the bonding of return walls, footings, and damp-courses. The rules as to heights and lengths of walls, and of thickness of walls with respect to domestic buildings conform with those of the Model By-laws; but the rules for buildings of a public or warehouse class show some deviation with regard to the lengths of walls of buildings of 40ft. high, 50ft. and 60ft. We may quote the rule for thicknesses up to 40ft. "If the wall does not exceed 30ft. in length, it shall be 13½in. thick at its base. If the wall exceeds 30ft., but does not exceed 60ft. in length, it shall be 18in. thick at the base. If the wall exceeds 60ft. in length, it shall be 22in. thick at its base." In the Model By-laws the limits of length are 35ft. to 45ft. The same increase in the limits of length is made with respect to walls up to 50ft. high and 60ft. In the latter case, the 45ft. length of the model rules is reduced to 35ft. for 22in. walls. Referring to the construction of staircases, by-law 32 prescribes that the stairs in every new domestic building shall "have a tread of not less than 8in. in width, and with a rise of not more than 8½in. for each step. The width of the tread in winding staircases shall be measured in the centre of the tread, and every person shall construct such stairs with a proper banister handrail or balustrade of a height of not less than 2ft. 6in. measured perpendicularly at right angles from each step." This clause is not introduced in the Model By-laws; its omission is a defect in most by-laws, therefore the Birmingham authority have done right in inserting a clause on staircase construction, as numerous fatal accidents occur from want of properly planned staircases. We fail to see the clause as to open spaces at the rear of new buildings, provided for in the Model By-laws—which is a very necessary rule in the building by-laws of all great towns. Time does not allow us to compare other clauses with those of the Local Government Board. On the whole, we think the new by-laws are pretty complete, with the exception of those points to which we have alluded.

THE ARCHITECTURAL ASSOCIATION BROWN BOOK.

THE tendency of reports and kalendars of societies and public bodies is to increase in bulk year by year, and that of the Architectural Association, familiarly known as the "Brown Book," is no exception to the rule, for this year it shows a further enlargement, and now numbers 168 pages. The committee's annual report is, as usual, of a highly satisfactory character, and in their opening sentence they express their pleasure in recording the continuation of the Association's career of usefulness and prosperity. During the past year the machinery of the Association has, it is stated, been actively maintained in full working order, and has been extended in several directions. The gradual increase in the number of members, and the large attendance at the ordinary meetings, has forced the Committee to consider the necessity of providing better accommodation, and they announce that, by the courtesy of the Council of the Royal Institute of British Architects, the ordinary meetings will, during the ensuing session, be held in the meeting room of the Institute. The classes have been well maintained in numbers and work, with the exception of that for the study of colour decoration. A new feature in the curriculum has been the series of lectures on "Graphical Statics," by Mr. Frederic Quick, which have been well attended. This course of lectures will be continued during the coming session. By the liberality of Mr. T. W. Aldwinckle and Mr. T. Blashill additional Travelling Studentships have been offered for competition; and

through the kindness of Mr. Arthur Cates, an annual prize has been instituted to be awarded to that member who, in his preparation for the examination in architecture of the R.I.B.A., has made the best use of the classes of the association. Papers were read during the session by Messrs. Aston Webb, J. D. Sedding, T. Pridgin Teale, M.A., F.R.C.S., H. Longden, T. M. Rickman, F.S.A., Professor Corfield, M.A., M.D., Walter Crane, A. Baker, H. Lovegrove, G. Aitchison, A.R.A., J. L. Robinson, R.H.A., and R. W. Paul, and were all reported in our columns. The following buildings and works were inspected during the usual fortnightly visits on Saturday afternoons:—Church of the Sacred Heart, Wimbledon; New Sion College; St. George's Schools, Westminster Bridge-road; Church of St. Mary, Clapham-common; Church of Corpus Christi, Brixton-rise; the National Gallery; Houses of Parliament Drainage Works; Lambeth Palace; Dent and Hellyer's Works; Church of St. Bartholomew the Great, Smithfield; National Liberal Club; St. Thomas's Seminary, Hammersmith, and Chiswick Church. "Vacation Visits" were paid to "Woolpits" Mansion, Banstead Park, Cambridge, Sutton-place and Loseley Park, Churches at Streatham, "Ascott" and Leighton Buzzard, Minley Manor, "Bramshill," and House in Cadogan-square. An excursion to Italy was made at Eastertide by a small party of the members, and the annual summer excursion was held in August, the city of Bath being the centre from which trips were made. The following are among the honours taken by members during the past session:—At the Royal Institute of British Architects, the Owen Jones Travelling Studentship was taken by S. Vacher; Pugin Travelling Studentship, T. Maclaren; Medals of Merit, A. B. Mitchell and E. H. Selby; Certificate of Honour, R. W. Paul. Tite Prize: Certificate of Honour, W. Stirling; Soane Medallion and £50, F. E. Masey; and Certificate of Honour, A. Sykes; Essay—Silver Medal and £26 5s., R. E. Smith. Twelve members passed the Institute Examination in Architecture, and four passed the Statutory Examination for District Surveyors. At the Royal Academy, Silver Medal for Measured Drawings, G. T. McCombie; and at University College, London, Donaldson Silver Medal (Construction), second prize, R. S. Maynard. The list of members shows a slight increase, being 993, against 972 last year; but in 1885 the numbers were 1,013, and in 1884, 995. With the exception of the two last named years, the present is the highest total of membership recorded during forty-five years of existence.

CHIPS.

Charles Lailey, district surveyor to the Acton Local Board, appeared at the Hammersmith Police Court, on Saturday, to answer a summons for maliciously damaging the greenhouse of Mr. John Hibbert. It appeared that he had pulled down the greenhouse by orders of the local board, and it was stated that they had a right to demolish a building not erected in conformity with the by-laws. Mr. Paget said it was a most high-handed act, and said he would not decide as to its legality. He refused to allow costs, the summons, on his advice, being withdrawn.

The Walsall town council have appointed Mr. C. L. Marston as assistant to the borough surveyor, at a salary of £150 a year.

The local board of Sandown, Isle of Wight, are about to build themselves offices from plans by the architect and surveyor, Mr. J. Newman. Mr. J. Ball is the builder, and the cost will be about £600.

The infirmary at Northampton is being enlarged from plans by Mr. W. Hall, of that town, at a cost of £3,700. Mr. H. Martin is the builder.

The Corps of Royal Engineers have decided to erect a monument to General Gordon in front of the Royal Engineers' Institute at Chatham.

The partnership heretofore subsisting between Messrs. Best and Commin, of Exeter, architects, surveyors, and auctioneers, is announced to have been dissolved.

At the inquest held on Tuesday on the youths burnt to death by the fire which recently occurred on lath and timber-built premises situate in the narrowest part of the Strand. The jury returned a verdict expressing their opinion that there was not sufficient evidence to show how the fire was caused, and adding a rider suggesting that legislation should be brought into operation providing for periodical inspections of buildings not protected with party walls.

Building Intelligence.

Bournemouth.—On St. Michael's Day, after service at St. Michael's Church, Bournemouth, the clergy and choir went in procession to the new Mission Hall, where prayers were said and the building declared open by the vicar, the Rev. F. E. Toyne. A large number of the congregation came from the church, and the workmen who had been employed on the building attended. The architect is Mr. Reginald Pinder, F.R.I.B.A., M.S.A., and the builders are Messrs. W. E. Jones and Son. The cost is about £600.

Bristol.—The Castle Green Board Schools were opened on Monday. The School Board advertised for designs in the spring of 1885 for a school capable of accommodating 1,050 children in three departments, the site being that of the ancient castle at the end of Castle Green. Out of upwards of forty plans, those of Mr. Stuart Colman, of London and Bristol, were selected, and these were subsequently altered to give an increased accommodation, 1,230 children being provided for. A principle new to the West of England was adopted by the architect in his design, the school being made to consist of a large central hall, surrounded by classrooms shut off from it by movable glass partitions. These divisions can be removed, and the whole space thrown into that of the large hall. A large swimming-bath forms an important part of the school, and will doubtless be much used and appreciated by the scholars. The style is a free treatment of Queen Anne; the building is of brick, with buff terra-cotta dressings. A residence, containing a cookery classroom, has been erected on one side of the school, and forms a prominent feature in the front elevation. The general contractor was Mr. A. J. Beaven, of Bedminster.

Bradford.—A new school which has been built by the Bradford School Board in Drummond-road, Manningham, was opened by Viscount Cranbrook, Lord President of the Council, on Monday. The site of the new building embraces an area of 12,635 square yards. The school is formed on the class-room principle, and includes two main buildings, one for the mixed and the other for the infant department. The former consists of a large room, 96ft. by 50ft. and 30ft. high, with eleven class-rooms, accommodating from 56 to 90 children each. The infants' department has also a main room, 52ft. by 35ft., surrounded by five classrooms. The total accommodation provided is for 1,169 children. Mr. E. Peterson, Thornton-road, Bradford, designed the building, which is in the Domestic Gothic style. The contracts were let for £11,406, and the land was purchased for £5,946, the total cost of the school, including furnishing, amounting to about £19,000. The cost per scholar was £9 5s. 4½d.

Exeter.—The corner stone of the Cathedral cloisters and library will be laid on Wednesday next, with public ceremony. The cloisters and library will be a restoration of the ancient buildings. During the excavations the whole of the ancient foundations have been found, together with a very large quantity of moulded and sculptured stonework. Careful drawings of these remains have been made, and the design of the new work is taken from these fragments. The sections of the work now in progress, and which are rapidly advancing, are the south-east angle bay, with two bays of the east cloister and two bays of the south cloister; the staircase to the library over the eastern cloisters and the lavatories; also the library over the five bays of the cloisters now being built. There will be arcaded and vaulted cloisters on all four sides of the quadrangle, which will extend from the tower over the south transept to the west front of nave, and will have a cross in the centre of the garth. The whole of the work is in selected oolitic stone, from the quarries at Doulting, near Shepton Mallet. The whole building will be fireproof. The floors of the library will be executed in solid oak parquetry, bedded on the stone groining of the cloisters below; the roofs of library and staircase of solid oak, with trussed rafters and beams, carved and elaborately moulded. The architect is Mr. J. L. Pearson, R.A., and the outside roof will be covered with heavy cast lead. The whole of the works are being executed by Messrs. Luscombe and Son, of Exeter. Since the commencement of the works at the cloisters, Mr. Pearson has intrusted to Messrs. Luscombe and Son the making and sculpturing of the Bishop's Throne; the frontal chest for Truro Cathedral, and sculptured oak stalls for Shrewsbury Abbey; the building and sculpturing the new University Library at Cambridge, and the erection of a house at Spurfield, Exminster.

The Imperial Institute.—The Building Committee having made a selection from a list of 46 applicants to tender for the first portion of the foundation contract, received offers from the following firms: J. and J. Greenwood, Brass and Son, Thompson (Peterborough), Lovatt (Wolverhampton), Dover Bros., Lucas Bros., Macey and Son, Barnsley (Birmingham), Kirk and Randall, Munday and Sons, Higgs and Hill, Trollope and Sons, and Mowlem and Co. The tender of Messrs. Mowlem, Burt, and Co. being the lowest, and their schedule of prices comparing favourably with those of other firms, their tender has been accepted by the committee, and the work will commence very shortly. Mr. G. Wallis, who was formerly chief clerk of the works in the construction of the Royal Courts of Justice, has been appointed clerk of the works for this contract.

Liverpool.—The memorial stone of new engineering laboratories now being added to University College was laid by Earl Derby on Saturday. They are being built at the cost of Sir A. B. Walker, from plans by Mr. A. Waterhouse, R.A., the architect of the college, and consist of a building in terracotta and grey brick fronting Brownlow-hill. The main part of the edifice will have three floors, with a frontage of 60ft. Between this front and an adjacent lying-in hospital will be a wood-working shop which will contain 30 or 40 benches and 20 lathes, together with a circular saw, a "universal joiner," and other tools. This shop will be a one-floor structure, with a frontage of 110ft. and 20ft. in width. There will be also an annexe on the side of the main building, comprising the boiler-house, a smith's shop, and a small foundry. In the main building there will be on the ground floor the main laboratory, testing-house, and machine shop, which will be all in one, and have a clear height of 22ft. In this there will be a large testing machine, a triple-expansion marine engine of at least 100H.P., besides numerous testing machines. On the first floor there will be a museum for engineering models and specimens, a lecture hall to seat 120 to 140 students, lavatories, the professor's and his assistants' room, a room for the preparation of apparatus, and a smaller lecture room. There is to be a mezzanine floor between this and the top floor for the preparation and storing of diagrams. On the top floor is a drawing hall, 60ft. by 50ft., classrooms, and students' rooms. Finally, there will be a photographic room for the reproduction of engineering drawings, and atank to give a head of water for hydraulic experiments in the laboratory below, and an anemometer turret for experiments on the pressure of wind The cost of the buildings will be about £35,000.

Paisley.—A new Congregational church, erected from designs by Mr. J. B. Wilson, A.R.I.B.A., Glasgow, has just been opened at Paisley. The church is in Early Gothic style, and has a tower and spire of 100ft. high. Sittings have been provided for about 500 people, and there are also a hall seating 200, classroom, vestry, ladies' room, &c. The total cost is under £3,000. The church was illustrated in the Building News of September 10th, 1886.

Pearston, Cape Colony.—The new Dutch Reformed Church at Pearston, between Somerset East and Graaff Reinet, was opened on July 30th. The building has been 23 years in the course of construction, having been abandoned since 1864, when it had been partially built. Mr. Arthur H. Reid, A.R.I.B.A., of Port Elizabeth, was instructed to make the best he could of the walls. The work has been carried out by Messrs. Thomson, mason, and Isacke, carpenter, of Graaff-Reinet. The old walls were disturbed as little as possible, and, being of brick, are necessarily plastered with

Portland cement outside and lime inside. The floors are of wood, and the roof covered with galvanised corrugated iron, painted outside. The ceiling is of wood, semi-hexagonal in form, following the form of principal roof timbers which are wrought. All outside mouldings and ornaments are in Portland cement, and the inside in plaster of Paris. The outside doors and all windows are of teakwood. The pews, which accommodate 550 persons, are of deal, with panelled backs and ends. The cost has been £5,000.

Sutton, Surrey.—Christ Church has just been opened at Sutton. The church is designed in the Early 13th-century style, and when complete will accommodate 1,000 worshippers. The work included in the present contract consists of nave 92ft. by 30ft., and 48ft. in height from the floor to the semicircular barrel-vaulted ceiling; north and south aisles of the same length as nave, 15ft. wide and 14ft. in height; chancel with apsidal east end 40ft. by 28ft., and ceiled at a height of 40ft.; clergy vestry, choir vestry, organ chamber, furnace room, and lavatories. Accommodation will thus be afforded for 900 persons, inclusive of choir. The tower and spire, which will be 160ft. in height, the northern baptistery, south chapel, and south porch are intended to be dealt with in a future contract. Local stock bricks are used for walls, faced internally and externally with local red bricks, Bath stone for columns, caps, and bases of interior and for external weatherings, and Broseley pressed roofing tiles for roof coverings. Internally the floors will be paved with wood blocks, with the exception of the space within the Communion rails, where Broseley pressed tiles will be used. The warming is to be effected by means of hot water on the low-pressure system, and ventilation is provided for by controllable air inlets through the hot-water pipes and in the sills of windows, and exhaust ventilation through the ceilings. The seating, choir stalls, and most of the furniture and fittings are included in the present contract, amounting to £6,788, which is being carried out by Messrs. T. Gregory and Co., from the designs of Messrs. J. T. Newman and William Jacques, of 2, Fen-court, E.C., and Sutton.

COMPETITIONS.

Gloucester Baths.—In the competition for a group of swimming, private, and Turkish baths, instituted by the corporation, 60 sets of designs have been sent in, and were opened and examined before a committee on Monday. Premiums of £50 and £25 were offered, the two premiated designs to become the property of the corporation. The following are the mottoes of the designs:—"Glo'ster," "£5,680" (in two circles), "Maltese Cross," "Plan," "Aqua," "Experience" (in circle), "Echo," "Lavo," "Sanitas," "1887," "Sagittarius," "Try Again," "Severn," "Leander," "Aquarius," "Sanitas," "Jordan," "Jubilee," "Verdoyant," "Experientia," "Health," "Lucia," "Perseverance, Red Crescent, 1887," "Fontes Sanitatis," "Glevum," "New Moon" (device), "Patientia Vincit," "Axiom," "Dum Spiro Spero," "Dignum Est," "Aqua Pura," "Practical Experience," "Veni, Vidi, Vici," "A Native's Notion," "Aqua," "Be-clever," "Health," "Truth," "Scale," "Economy," "Utility," "Latin Cross" (device), "Bon," "Polo" (in circle), "Forward G.," "Dum Spiro Spero," "Au Bon Droit," "Unitas," "£6,000," "Corridors," "Fides Invicta Triumphat," "Faith," "Neptune," "In Great Haste," "± Experience, 1887 ±," "Lavo," "Alga," "No," and "Spica." Two other plans were received too late. We understand that the committee have rejected forty of the plans, reserving the other twenty for further consideration.

Swinton.—The design of Mr. F. H. Oldham, F.R.I.B.A., of 23, John Dalton-street, Manchester, has been selected in open competition for the intended public baths for Swinton and Pendlebury Local Board district.

Major-General C. Phipps Carey held an inquiry at Redcar on the 6th inst., in response to an application from the local board to borrow £1,500 for laying out pleasure gardens. Mr. James Howcroft, their surveyor, presented the plans which he had prepared, and explained the mode of carrying out the proposed work.

Engineering Notes.

Association of Municipal and Sanitary Engineers.—This Association, which has now a membership of about 350, held its fourth examination for certificates in the Town Hall, Manchester, on Friday and Saturday, when ten candidates entered. The Examiners were Mr. Cordon, M.I.C.E., Leicester borough engineer, president of the Association, who examined in sanitary science; Mr. Laws, M.I.C.E., Newcastle-on-Tyne city engineer, who examined in building construction; Mr. Ellice Clark, M.I.C.E., London, county surveyor, Sussex (West), who examined in engineering as applied to municipal work; and Mr. H. P. Boulnois, M.I.C.E., borough engineer, Portsmouth, who examined in public health law. Mr. T. Cole, Westminster, the secretary of the Association, was also present at the examination. These examinations are held twice a year, the first always taking place in London in April, and the second, which is fixed for October, it is intended to hold in different centres in the country to meet the convenience of local candidates.

Lynmouth. — The favourite little North Devon seaside resort, Lynmouth, was, on the 27th ult., the scene of a very interesting ceremony—viz., the opening of the first section of an esplanade, which is a portion of an important scheme for the improvement of this resort. The scheme is the construction of an extensive promenade running from the old tower on the quay to Riddiball, a point on the other side of the bay, and from this point it is intended to construct a pier. A lift for conveying people from Lynmouth to Lynton is proposed to be constructed, which will be a counter-balance one worked by water-power. The wall protecting the walk from the sea is 7ft. at the base and 4ft. at the top, and in some places is 27ft. deep, with counter-forts, and is built with local stone. There is a footpath 12ft. wide, and a roadway 30ft. wide. Outside the wall the local board contemplate constructing a bathing place. The contractors are Messrs. Jones Brothers, of Lynton, and the engineers Messrs. Davison and Davison, of Windsor.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Glasgow Architectural Association.—At the last meeting of this body a paper was read by Mr. Henry Baldie on "Scottish Domestic Architecture." He excluded from notice the important and better known examples described and illustrated in various books, confining attention to the more ordinary type of dwelling-house prevalent during the latter part of the 16th and two succeeding centuries. Of these the best existing specimens were, he said, to be met with in Edinburgh, though there were several good examples of the later periods in Stirling, and, scarcer still, in Glasgow. A collection of some of the most characteristic features of Scottish work was shown by drawings—crowsteps, scrolled terminations of gables, dormer windows, plaster ceilings, rain-water pipe heads, and wood wall-linings of rooms. Of each there was a marked variety of treatment in different localities, for Glasgow possessed a form of roof found, he believed, nowhere else; while the old piazzas were noted by visitors as peculiar to that city.

New premises have just been erected on the site of Nos. 104 and 105, Bishopsgate-street Within, for Messrs. Moore and Moore. They are Italian in type, and are faced with red bricks, red Mansfield stone being used for dressings. Messrs. Chatfeild Clarke and Son, of Bishopsgate, were the architects, and Mr. B. Nightingale the builder. The hydraulic lift was constructed by Messrs. Archibald Smith and Stevens. The lighting was by the Wenham Light, and the floors have been laid with terrazzo marble by Messrs. Burke and Co., of Newman-street.

At a meeting of the Royton Local Board the plans prepared by Mr. R. Vawser, C.E., Manchester, for the main drainage of the district and the purification of the sewage thereof, at an estimated cost of about £27,000, were unanimously adopted, and the clerk was directed to submit the same to the Local Government Board for their approval.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

Received.—S. Bros.—C. G.—D. U. H. A.—T. B. L. B.—T. H.—W. R.—S. W. P.—M. and N.—D. L. B.—T. N.—E. and Co.—B. C. G. Co.—S. and P. L. B.—F. E. and Son

Correspondence.

BIRTLEY CHURCH.

To the Editor of the Building News.

Sir,—In last week's "B. N."—"Wayside Notes"—I see that I am requested to give some dimensions of Birtley Church, Northumberland, for the restoration of which I was architect. The inside dimensions of the chancel are 16ft. 3in. by 14ft. 6in., and of the nave 44ft. by 18ft. 3in. The height of the springing of the chancel arch from the present nave aisle floor level is 7ft. 6in., and to the crown of the arch 10ft. 10in.; the width is 6ft. 8in.; the walls are 3ft. 3in. thick. Any further information may be obtained from a work to be published by the vicar, the Rev. G. Rome Hall, F.S.A., upon "Birtley Church and Parish, Northumberland."—I am, &c., Arthur B. Plummer.

46, Cloth Market, Newmarket-on-Tyne,
Oct. 8.

A PROVIDENT FUND FOR ARCHITECTS' ASSISTANTS.

Sir,—It is natural to suppose that architects' assistants occasionally fall ill. They are not, as a rule, rich men, and yet they have no fund at their disposal to tide them over a period of sickness. Why are they so improvident? Surely it would not be a difficult matter to start such a fund. Other men see the necessity of it: Why do they not? At first it would be but a simple affair, yet in time it might become a big undertaking—possibly a home in the country, to which sick assistants could retire to recuperate their health. This is merely a suggestion. Will not one of the organised bodies of the profession

move in the matter? It would be a popular step, and they would earn the gratitude of many a poor assistant.—I am, &c.,

PROVIDENT.

PLAGIARISM.

SIR,—Though rather late in the day, may I be permitted to call your attention to the fact that the paper on "Architectural Draughtsmanship," signed by Mr. Chas. T. Taylor, and published in your issue of the 15th of July, almost entirely consists of extracts from my little book on the same subject, which, you will remember, was reviewed at some length in your columns at the time of publication?—I am, &c., G. W. TUXFORD HALLATT.

15, York Buildings, Adelphi, W.C.

DRAIN TRAPS.

SIR,—I see in your issue for this week, in the Correspondence column, a letter from "Clerk of Works" respecting an accessible drain trap, accompanied by illustration. Your correspondent must be in error as to the time the traps have been in use at the place he refers to, as it was patented by me in 1878, and is manufactured by Ingham and Sons, Wortley, near Leeds. The opening at the bottom of the trap taken vertically is about 4in., and the dip, or water seal, about 2in. The loose lid, or cover, at back of trap is luted with clay, and gives access for cleansing purposes. They are provided with a 6in. vertical opening and socket end for a ventilating pipe, which can be taken to surface of ground or carried up the wall side to any required level.—I am, &c.,

WM. BROWN, Architect.

Clifford-street, York, Oct. 8.

THE WEST OF SCOTLAND SANITARY ASSOCIATION ON HOUSE DRAINAGE.

SIR,—Mr. Paul Rottenburg, of Messrs. Leister, Bock, and Co., Glasgow, has left me to call attention to the following, believing it to be of public interest:—

In 1881 I was engaged by Mr. Rottenburg to improve the drainage of his house, "Holmhurst," in the suburbs of Glasgow. The work was done on the sectional system, a disconnecting trap being placed on the main drain between the house and the sewer, and all the branch pipes—rain, soil, and waste—delivering into said main drain, were again trapped off it and ventilated separately, so that neither sewer nor drain air could get access to or up any of the rain, soil, or waste pipes. To ventilate the drain a special 4in. iron blow-off pipe was put up outside to above roof of the house with a fixed exhaust ventilator on its top, the fresh-air inlet being near the manhole of the main disconnecting trap.

This system has been working well enough since, just as it is doing in hundreds of other gentlemen's houses and mansions throughout the country.

A few weeks ago Mr. Rottenburg got the West of Scotland Sanitary Association to inspect the drainage of his house, and after getting the report he asked me to meet him and the Association's engineer at his office about it. I went and met them, when Mr. Rottenburg read over the report, and asked specially what I had to say in regard to the following words in it:—

"Several desirable improvements might be made on the system, due to the advancement of sanitary knowledge, such as the removal of the traps presently at the base of the soil-pipe and at the servants' closet. It is now generally acknowledged that no traps should intervene between the trap on the main outlet and the soil-piping."

To this I replied to the effect that I considered the proposed alteration would be the exact opposite of an improvement and a pure waste of money. It would be equivalent to taking out the watertight divisions in a ship and asserting it was thereby made safer. And as to the "generally acknowledged" assertion, that, in my opinion, was a falsehood, as both Mr. S. S. Hellyer, of London, and myself practised, and in our textbooks advocated, the use of traps at the foot of soil-pipes where practicable, and many architects carry out first-class drainage work in this style.

The engineer then said—"Surely you will allow that, as the soil-pipe is already dirty, it is the natural ventilator for the drain?"

I could not admit this, more especially not in this case, as the drain had a special blow-off pipe for itself outside of the house, while the soil-pipes here were inside of the house, and each had enough to do with its own smell, &c., without having smells and disease germs from the drain sent up or through them.

The upshot was that Mr. Rottenburg declines to make the suggested alterations until it can be shown that, allowing the air of the drain to go up the soil-pipe inside, his house would be better than making it go up the special pipe outside of it.

He also asks, Who is the highest authority to settle this?

In reply to this, I would observe that the matter is a question of sanitary plumbing, and should be decided by a specialist or specialists. Desirous of educating the public in sanitary plumbing, the National Health Society, London, got up some lectures at the Society of Arts room on the subject some years ago, and the gentleman appointed to give these lectures was Mr. S. S. Hellyer, a practical master plumber in London, and in his lectures and elsewhere he advocates the trapping of soil-pipes at foot to lock off the drain air from them.

The reason for this is to prevent one soil-pipe which may have disease germs in it from contaminating the other soil-pipes, and so that when disease breaks out in a house it can be the more easily isolated. This is all the more necessary now when so many of the water-closets are made wholly of earthenware, and so liable to be broken at any moment and pollute the whole atmosphere of the house with foul air from the main drain if the soil-pipe is not trapped off at its foot.

If those parties who have their water-closet soil-pipes ventilating the drains understood this properly, I believe many of them who can afford it would have them altered as soon as possible. This is a case where prevention is better than cure.

In the article on "Sewerage," in the new edition of the "Encyclopædia Britannica," by Professor Ewing, the author illustrates the water-closet soil-pipe trapped at foot, and says:—"The form of disconnecting trap shown in Fig. 6 is that of Mr. W. P. Buchan, of Glasgow, who has done excellent service to the cause of sanitary reform by practising and advocating the disconnection and ventilation of house drains and soil-pipes."

Now, if the disconnection of the soil-pipe is really excellent sanitary work, the public or, at all events, the members of sanitary associations are entitled to pause before they alter this in the face of such men as Mr. Hellyer and Professor Ewing, merely at the dictum of a young and unknown sanitarian, even although he should hold the post of engineer, or "assistant engineer" to a sanitary association.

One effect of removing the traps from the foot of the soil-pipes would be to enable them to be the more easily tested—viz., by the same application of the smoke test (which test, by the way, now so universal, was not invented by any of these associations or their engineers, but by the writer hereof) which is applied to the drain; but although that may save time and trouble to the "engineer" in testing, it is the opposite of extra safety for the house.

If it be that the fee charged from the members is too small to allow time for properly testing houses fitted with a series of traps, then, in my opinion, it would be more in the public interest to raise the fee rather than condemn first-class work, and put the members to the expense of turning it into second-rate for some sanitary *plumber* to afterwards improve.—I am, &c., W. P. BUCHAN.

21, Renfrew-street, Glasgow, Oct. 10.

The improvement committee of the Newcastle-on-Tyne Corporation having declined to pass a plan by Mr. Stockwell, architect, for the erection of house property in flats on Rye Hill, have received a letter from Messrs. Hodge, Westmacott, and Robsons, solicitors, threatening to apply for a mandamus to compel the corporation to pass the plan. The town clerk has been instructed to make the necessary appearance in defence, so as to test the powers of the corporation in reference to the passing of property plans.

The town council of Dewsbury have raised the salary of Mr. H. Townsend, their gas and water manager, from £250 to £300 per annum.

Intercommunication.

QUESTIONS.

[9423.]—**Expansion of Portland Cement Concrete.**—We have authorities for the expansion of many solids by heat—e.g., Hurst says that ordinary brick makes a linear expansion from 32° to 212° of one part in 1818 and Roman cement of one part in 697. Could any of your readers give me trustworthy data of the expansion of Portland cement concrete due to increase of temperature, giving at the same time the composition of the concrete?—R.

[9424.]—**Gable Ends.**—A. is the owner of a freehold piece of land, and has built some cottages thereon. He has left two gable end walls 9in. thick. He was compelled by the building by-laws to have 9in. walls between the houses, and to leave 9in. gables, as there was no building on that side of the street previous to A.'s. B. has purchased a piece of freehold land adjoining one of A.'s gable ends, and has built some property, but has only put up a 4½in. wall against A.'s 9in. The local authority waive their building by-law when a 9in. wall is up, and another person adjoins by only putting a 4½in., as the thickness of the wall between A. and B.'s property is actually more than required by them. B. has not tied into A.'s wall, and has put his 4½in. wall on his own land, but close up to A.'s wall. By reason of A. having been the first to build, B. saves a 4½in. wall. Can any of your readers say if A. has a claim for compensation against B.? If A.'s wall had not been built, then B. would have had to build a wall 9in. thick to satisfy the local authority. Please quote cases on the point, if any.—ENQUIRER.

[9425.]—**Cement Concrete Footpaths.**—Some footpaths were laid to the following specification:—On a foundation of broken bricks and stones 6in. thick was laid cement concrete 2in. thick, consisting of 2½ parts of crushed bricks to 1 part of Portland cement, except the surface, which consisted of 2 parts of crushed granite to 1 of cement. The surface portion was ¾in. thick, and laid at same time as the lower portion, so that the whole should set solidly together. The cement was used cool. These footpaths have failed owing to the substratum done with crushed bricks having expanded and disintegrated, cracking up the granite surface, which has otherwise remained sound and good. Some blocks made by a neighbouring builder with the same crushed bricks, but different cement, have also failed by bursting and cracking in all directions. All this appears to point to something deleterious existing in the crushed brick. A sample of the latter was washed, and the effluent water roughly analysed and found to contain sulphur, manganese, and cobalt or nickel. Can any correspondent say whether these matters are deleterious, or suggest the cause of what has happened?—CASTRUM.

[9426.]—**Arch in Lincoln Cathedral.**—In Britton's description of this cathedral, he refers to Ware's work on "Vaults and Bridges." On referring to this work of the date 1822, he says: "It is impossible here not to call to recollection of the enlightened antiquary that unknown wonderful arch, above the vaulting and between the towers of Lincoln Cathedral. . . . The horizontal extrados of the arch between the towers of Lincoln Cathedral is 28ft. in length, 11in. thick in the middle, 20in. thick at one extremity, and 28in. at the other. The extrados is about 15in. wide. It resembles a wooden beam rather than a stone arch composed of voussoirs." In Plate 9 of this work he gives a transverse section of the cathedral, showing the groining and roof-timbers, and at top of plate a diagram at larger scale showing the arch. Perhaps some of your numerous readers might give some information about it, or possibly a sketch showing its position above the groining. I visited the cathedral a few years ago, but was not then aware of this arch.—BELFASTIENSIS.

[9427.]—**Cheap Public Baths.**—In your Correspondence Column a few weeks ago I observed an inquiry as to cheap public baths, but so far as I saw, it elicited no reply. I am personally interested in this subject, but have had no experience of this special subject, and shall be glad of any hints, or to be referred to any work on the subject.—ENQUIRER.

[9428.]—**Architect's Sector.**—Would any of the readers of your valued journal enlighten an inquirer as to the use of the lines and figures on an ordinary architect's sector?—DANNIE.

[9429.]—**Building Estates.**—Will any of your readers be kind enough to state what are the usual surveyor's charges for managing building estates—viz., staking out the building plots, making plans for conveyance, making plans for estate, also writing out and computing valuation of the property for the trustees of the estate?—SET SQUARE.

[9430.]—**St. Alban's Abbey—The High Altar Screen.**—In "Notes and Queries" column of the *Herts Advertiser and St. Alban's Times* (Oct. 8th) occurs the following:—"HIGH ALTAR SCREEN IN ST. ALBAN'S CATHEDRAL.—In 'Observations on the Abbey Church of St. Alban,' published by the Society of Antiquaries in 1810, and illustrated by Carter, there occurs a large measured drawing of this screen. It is noticeable, however, that he draws the thirteen niches, immediately over the altar, each one precisely the same size as its fellows; although, as a matter of actual fact, the central one is considerably wider than the other twelve. Nash's drawing of the same screen, published by Nichols, Son, and Bentley, 1815, is still more inaccurate, for he omits the central niche and shows a row of twelve only. But the strangest thing of all is that in the expensive and otherwise exhaustive volume published in 1877, by James Neale, F.S.A., Associate of the Royal Institute of British Architects, and entitled 'The Abbey Church of St. Alban,' the sixty sheets of illustrations do not embrace among them a single reference to this screen. This extraordinary omission has been frequently commented upon, but never explained. Can any reader give a reason for this oversight?—AMPHIBALUS" Does any correct illustration of this screen exist? If so, where can it be found?—SCULPTOR.

[9431.]—**Water Stains in Mezzotints.**—Can any reader inform me how water stains can be removed from old mezzotinto without injury to the prints?—COLLECTOR.

[9432.]—**Black Stains in Varnished Stained Deal.**—I put a dado in deal, stained light, and varnished, in a billiard-room about three years since, and recently some black stains have appeared on the wood. Could any reader explain the cause? It is well ventilated at back.—H. H.

REPLIES.

[9411.]—**Flue Linings or Tubes of Glazed Fireclay.**—As to their liability to crack, I have spoken to a foreman of some experience in building, and he said salt-glazed pipes are given to splitting when used for flue linings, or subjected to much heat or pressure. I have also seen a pipe-maker of long standing, who said that, although the glazing is done at a time when the heat in the kiln is most intense, yet in cooling down the glaze contracted, and would not allow for expansion on the pipes being reheated; but that unglazed tubes were not subject to this defect. I have used glazed socketed fireclay pipes for flue linings for houses during the last ten years without a single complaint, and I have recently had some 12in. ones fixed to a smithy fire, where they are exposed to view for some 15ft. at the lower end, and as yet there is no sign of cracking, although they are subject to sudden heating and cooling.—Tolop.

[9418.]—**Ventilating Small Room.**—J. Marshall should carry a 4in. dia. pipe from ceiling of sitting-room to the roof, and fix thereon a small Boyle's air pump or other ventilator. For admission of air, a vertical tube fixed in a corner of the room is the best and simplest arrangement.—J. C.

[9419.]—**Waterworks.**—I have invented and patented an electro-mechanical apparatus for indicating the rise and fall of water in reservoirs at any distance from the point of observation, and if the inquirer will put himself into communication with me I shall have much pleasure in furnishing him with all the information on the matter, as well as probable cost. In answer to his second inquiry, I may say that the pressure is the same, whether the sluice valves are partially or fully opened.—George Jennings, Palace Wharf, Stangate, S.W.

CHIPS.

The new church, organ chamber, and vestries just added to St. Michael's Church, Stone, were consecrated last week by the Bishop of Lichfield. The additions are the gift of Lady Forrester, in memory of her nephew, Viscount St. Vincent; the style adopted is Late Perpendicular, carried out in Westwood stone. The floor has been laid with tiles by the Campbell Tile Co. The contractor for the general works was Mr. N. Barlow, of Stoke, and the architects were Messrs. R. Scrivener and Sons, of Hanley.

A new reredos has been erected at Binstead church, Hampshire. The work is in Bath stone, and has been erected by Messrs. J. and T. Ellery, of Ryde. A new pavement has also been laid inside the altar rails of the same church.

A new Wesleyan chapel at Hollingbourne, Kent, was formally opened last week. The chapel affords accommodation for 200 persons, and is built of Kentish rag stone, the interior woodwork being of plain deal wood. The total cost was £620, including the site. The architects were Messrs. Ruck, Son, and Smith, and the builder Mr. J. C. West, of Maidstone.

Amongst the recent evidences of the progress and development of Peterborough are the completion of the new church of All Saints', in Park-road, designed by Mr. Temple Moore, of Hampstead, which will be opened on November 1, and a large steel factory erected for the G. N. R. Company at a cost of £4,000. There is also in prospect a G. E. R. station, and the Co-operative Society have decided to expend £7,500 on a new set of buildings in Houghton-street.

Operations will be commenced next week in building the Jubilee Hospital at Gateshead-on-Tyne. The architect is Mr. W. H. Dunn, of Newcastle, and the tender of Messrs. Haswell and Waugh has been accepted at £2,056 for the erection of the building, the site of which is a plot of two acres on Shipcote Farm.

A new Roman Catholic school is being erected in Portugal-street, South Side, Glasgow, in connection with St. John's Chapel. Designed by Messrs. Pugin, London, the building is estimated to cost £4,000, exclusive of furnishings.

The Lord Mayor will formally open the new park at Kilburn, which the Ecclesiastical Commissioners have conveyed to the corporation to be maintained by them in perpetuity, for the use and recreation of the public, on the afternoon of Saturday in next week, the 22nd inst.

New police barracks have just been erected at Andersonstown, near Belfast, for the accommodation of 20 men. Messrs. Young and Mackenzie, of that city, were the architects, and Mr. Keith was the contractor.

At the Middlesex Sessions on Thursday in last week, Jabez Reynolds, master builder, residing in Cambridge-road, Kilburn, who was indicted for a malicious assault on a boy named Moore, was found guilty of a common assault only, and was ordered by Mr. Edlin, the assistant judge, to pay the lad £10 as compensation.

Our Office Table.

Mr. John Robinson Botham, F.R.I.B.A., formerly well known as a Birmingham architect, died on Tuesday, the 4th inst., at Mount Pleasant, Lichfield, in the 76th year of his age. For some years past Mr. Botham had retired from practice, and removed from his residence at Erdington to Lichfield. Mr. Botham will be remembered best as the original designer of the Mason Orphanage at Erdington. He was also the architect of the Presbyterian Church in Broad-street, Birmingham, and was for many years largely engaged in private work in that town. Mr. Botham belonged to the old class of life members of the Royal Institute of British Architects, of which he had been a Fellow for a quarter of a century. He was not, however, in any sense a public man; his life was wholly spent in the practice of his art and in the society of a few friends who knew how to value the sterling qualities of his mind and heart.

The Kyrle Society is promoting a systematic effort to preserve the lanes and field-paths which still exists in the suburbs of London, especially such as form a means of access to commons, village greens, public parks, and other open spaces. The committee point out that the open spaces preserved for London will be shorn of much of their value if they are approached only through miles of close-built streets or dusty roads. While it is admittedly impossible to preserve intact the country in the town, something might be done to maintain green ways from point to point, and, especially, as approaches to the larger open spaces, if public opinion be aroused on the subject and timely steps be taken. There are still pleasant by-ways, partly lane and partly field-path, in the near suburbs; and further afield the number increases indefinitely. The aim of the Kyrle Society is to convert such ways, as opportunity serves, into broad strips of green sward planted with trees and traversed, where necessary, by gravelled paths. Where it is not possible to preserve grass avenues, negotiations with the landowner and builder might, in some cases at least, result in the formation of a boulevard with lines of trees and walking and riding ways, in addition to the carriage road—such avenues as are by no means rare in Paris or Brussels, but which are not at present to be found anywhere in London. In order to give practical form to their suggestions, the committee are sending out a form asking for particulars as to all lanes and field-paths in the Metropolitan suburbs, and asking that all information may be sent to the Hon. Secretary, Mr. F. J. Drysdust, 14, Nottingham-place, W.

Dr. Alfred Carpenter complains that the state of the river Cam within Cambridge grows worse every year, and that it is gradually being more largely used as a common sewer for the borough. He warns the authorities that a catastrophe will be the inevitable consequence unless they do their duty at an early date. As he cannot think that a University which is doing more to promote sanitary science than all the other examining bodies in the United Kingdom put together, by its liberal policy in granting diplomas in public health to all medical practitioners qualified to obtain them, can be blind to the dangers which threaten the frequenters of the banks and surface of the river within the jurisdiction of the Cambridge authorities, Dr. Carpenter concludes, therefore, that there is some local cause for the continuance of the nuisance which the University is unable to remove, and that the impediment to the purification of the Cam rests with the sanitary authority. He therefore urges that all sewage should be kept out of the river and applied to the land as near to the outfall as possible. Dr. Carpenter's appeal deserves, and indeed demands, the early attention of the Cambridge town council.

It is astonishing how contented people are to go on living in daily danger of serious accident from imperfect and obsolete household appliances. Last week, for instance, the Earl of Enniskillen met with a painful accident at Florence Court Castle. His lordship was in the act of lowering a metal skylight in the bath-room, when it fell and almost cut off the fourth finger of his left hand, the bone being completely shattered. A portion of the finger was amputated, and the Earl is now making favourable progress. Now, such a catastrophe would have been impossible with a proper appliance—such, for instance, as Verity's patent skylight lifter, with which most readers are familiar, and which, we notice, has just gained the highest award at the Adelaide Exhibition. Such matters should really receive more careful attention at the hands of architects when specifying for new buildings.

LEGAL INTELLIGENCE.

Alleged Misappropriation of Building Fees.—Cecil Richardson, 36, accountant, of 61, Mark-street, West Ham, was charged on a warrant before Mr. Partridge, at Westminster Police-court, with embezzling the moneys of his employers, the Vestry of St. George, Hanover-square. It was alleged that the prisoner, employed as ledger clerk and accountant at the Vestry Offices, had been in the habit of misappropriating fees which he received from builders requiring licenses for hoardings and the erection of buildings. It was said that proof would be given that prisoner entered very much smaller amounts than those paid to him. For instance, he received £2, and in his account put down 10s. Prisoner was remanded.

STAINED GLASS.

Leeds.—A stained-glass window has been presented to the Classical church of the Holy Trinity, Leeds, in memory of some teachers in the Sunday-school. It was subscribed for chiefly by the school children. Messrs. Powell Bros., of Leeds, were the artists.

Wakefield.—The west window of St. Mary's Church, Wakefield, has been filled with stained glass by way of memorial to the late Misses Scott. Moses, David, Elijah, and Isaiah occupy the chief lights, together with suitable canopies and other ornamentations; and the tracery lights contain the patron Saint St. Mary the Virgin and Angels. The work is in the style of the 15th century, and is from the studio of Messrs. Powell Brothers, of Leeds.

WATER SUPPLY AND SANITARY MATTERS.

Leamington.—In order to economise the use of the water pumped from the deep wells in Campion-terrace, the town council, some months ago, decided to pump water from the River Leam for street watering. For this purpose new mains have been laid through the greater portion of the town, reaching as far as Beauchamp-avenue, Ranelagh-terrace, Lansdowne-street, and Portland-street, respectively. The pumping engine is placed in the boiler-house at the pump rooms, and is capable of delivering 500,000 gallons of water per day in the highest part of the town, equivalent to filling 4 vans at one time In lieu of a storage tower, an automatic cut-off gear has been schemed to meet the requirements of an intermittant demand. The pumping engine has been made by Messrs. J. Evans and Son, of Wolverhampton. The quantity of well water saved by this scheme will, in dry weather, fall little short of 100,000 gallons; whilst when the two neighbouring parishes water their streets from the same source, as they intend to do, the daily saving will be increased by some 20,000 gallons.

The topmost stone of the Glasgow Municipal Buildings, the apex of the tower, was laid on Friday, the fourth anniversary of the laying of the foundation-stone. The tower is 220ft. in height. The internal arrangements are now in a condition which will enable operations to be carried on without interruption throughout the winter. The stone stairs are being built throughout the structure, the ornamental ceilings are being fixed up, and the plasterwork is in a forward condition, while a large part of the woodwork has been manufactured for the principal rooms. Mr. William Young, it will be remembered, is the architect; and the contractors are Messrs. Morrison and Mason.

The opening of the "George Williams" Young Men's Christian Association Memorial Hall, which has been erected in Bridgwater at a cost of nearly £4,000, provided by subscriptions from various parts of the country, took place on Friday. The style is Classic, freely treated. Messrs. Habershon and Fawckner, of Bloomsbury and Newport, Mon., were the architects; and Mr. W. H. Pollard, of Bridgwater, was the builder.

The partnership between A. and F. Culverhouse, of Purfleet, Camden Town, and Hampstead, contractors and brickmakers, has been dissolved.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1711.
FRIDAY, OCTOBER 21, 1887.

ARCHITECTURAL LECTURING.

A FEW years ago the architectural lecture consisted mainly of theories and critical disquisitions on style and buildings. The subjects were often chosen with a view of instructing the student upon the development of style or of some particular phase of architecture, and amongst them the admirable lectures delivered by the late Prof. Cockerell and Sir G. Gilbert Scott respectively on Classical and Mediæval Architecture must be mentioned as model compositions in their way. The lecturers were learned in their respective branches, and were bent upon showing what architecture was, and how its study and spirit could be best undertaken and acquired. The burden of these discourses was to point to the past, to some particular style, and to tell the student to go back to study it deeply, and imbibe its spirit. We seem now to be turning away from this view of art, and to have entered upon a transitional stage of study, as unlike the old as our requirements are different. The burden of the recent lectures and addresses to architectural students is educational—how to train and fit the student for his profession. From the past and its ideals, professors and teachers are turning to the present, and are beginning to examine their ground, and to inquire how the English architect stands amongst the profession in other countries and those surrounding him at home.

One decided gain in this new stage of self-examination and inquiry is the broadening of the architect's ground. For a long time he has been satisfied to become a kind of recluse to the world, its science, and opinions. He was satisfied with getting a reputation as an artist, an ecclesiologist, or an antiquary. His researches into Greek art and architecture went a long way, he thought, to obtain him recognition; or his inquiries into such recondite subjects as church orientation and symbolism, or into polychromy, or precedents as to the position of the pulpit and prayer-desk in old churches. A passport to the architect of the last generation was the authorship of a work on old examples, specimens of the architecture of Rome, of Ravenna, or of some French district. Now it is far otherwise. Illustrations of old work are almost overdone, and photography has rendered the labour less necessary than it was. The novelty and interest of sketching a cathedral have gone, at least from this point of view—it has been done so many times. So the architect has fallen back upon other resources; he has, in fact, been compelled to do so. His former narrow view of the world and things outside his art has been opening by the force of circumstances. "Art is long, life is short"; all at once he begins to discover that he must know something besides his art if he desires patronage. Society—by that complex term we mean the occupations and amusements of men and women; music and the drama, doctrinal and scientific controversies, hunting, shooting, riding, country sports, and a host of other games and vocations—must be studied and watched closely by him if he wishes to obtain a good or lucrative *clientèle*. This widening view of his business has been the result of the various influences of society reacting upon it. Besides society, he must know men and manners of every grade, or he cannot possibly design with knowledge; or become successful as an architect. Each class of building requires some information beyond the immediate knowledge of the architect and builder. The usages of society, the way people of different positions live, the requirements of the wealthy, and individual accomplishments have to be regarded in every plan for a residence. Schools and colleges, laboratories, rooms for science and art teaching, museums, hospitals, amongst various buildings, call to the task of the designer a large and miscellaneous variety of knowledge, which would have fairly been thought superfluous fifty years ago. This view is being taken up by professors of architecture. Prof. T. Roger Smith, in his useful introductory lecture to the architectural classes at University College, expressly spoke of the architect being expected to know "men and affairs" as well as building and art. There are few professions which call for more contact with other men than the architect, and yet experience has shown that a very few of those who enter the business are equipped or trained for such contact, and the explanation is that draughtsmanship, pure and simple, has absorbed all the attention and powers of the student. Or he is absorbed in art, and has no desire for anything beyond, particularly anything so distasteful as business. A few years ago preparation for professional practice was not thought of; each pupil in an office was supposed to pick up enough in his five-year term of apprenticeship to fit him for after life. The specification and estimate were looked upon as drudgeries; but of late architectural instructors have given particular attention to these branches of an architect's instruction.

Everywhere we find the lecturer telling the student to equip himself by study, though the condition of those who enter the profession upon the old lines has rendered him very far from being studiously inclined. The architect's pupil, taking him all round, is unfortunately not addicted to reading or much mental effort. We know many young men who take the professional journals simply to obtain examples of buildings, but who seldom read the columns or take any interest in the literary and scientific questions of the day. They must unquestionably take inferior places, for they are not seeking to be men of general information and culture, or preparing themselves for the examinations of the Institute and other bodies. We cannot be surprised at the difficulty experienced by the Architectural Association, which has been doing such good educational work in the past, in trying to create a studious habit amongst the students attending the classes. Various expedients are being put forward to endeavour to enlist their attention. The experience of teachers has shown, however, the futility of attempting to promote an intellectual aptitude where the mind is not favourably disposed. Hitherto, the chief ambition of the young architect has been to compete for the Soane Medallion or the Pugin Travelling Studentship, and it is the feat of draughtsmanship that has been the one aim. A very different ideal is now being put before him by the modern instructor. Draughtmanship *per se* is being placed in a secondary and subordinate place; the student has now to show that he is a master of his art in a literary and scientific sense, that he can design, understands something of the technical or workshop knowledge of the building trades, can write specifications and prepare quantities. With much natural distaste for reading, the young candidate for the profession has to study books he would never otherwise open; he has to renew his acquaintance with mathematics, languages, and history. France and Germany have been a long way ahead of us in the theoretical and literary knowledge of art. Their researches and treatises on the history of architecture are more numerous and superior to our own, which have been confined chiefly to works of delineation. All this effort to restore the position of the profession amongst others has been mainly due to external pressure. The public who employ the architect look to him for advanced ideas and knowledge of facts; if he does not bring science to bear on the plan and construction of a building, the engineer will in time take his place. If he fails in art knowledge he suffers the contemptuous smile of the amateur, who to-day is often better informed and read than himself.

We see, too, that a prominence is given to technical courses of instruction. The programme of the Architectural Association for the ensuing session contains two or three papers on practical questions, such as Hydraulics for Architects, by Professor Cawthorne Unwin; the Use and Abuse of Materials, by Somers Clarke, F.S.A.; and the classes are even more significant of the change in the studies of the young architect. The subjects comprise construction, graphic statics, quantities, surveying, design, and colour decoration. The provincial societies—the Manchester Association, for instance—have also awakened out of the dilettantism which a few years ago they indulged in. Practical questions of an uncompromising kind, relating to materials and construction and sanitary matters, are being threshed out with an earnestness and thoroughness which would have surprised the student of the profession thirty years ago. America, with its colleges of architecture and technical schools, is close on our heels, and the English practitioner is obliged to advance if he does not wish to be overtaken. Materials and inventions have received a great impulse in America, and the study of the utilitarian branches have produced a healthful reaction from the archæological torpor which once fell upon the States of the West.

ALTERATIONS IN OXFORD-STREET AND LINCOLN'S INN-FIELDS.

AN awkward and bewildering convergence of streets is to be met with in Oxford-street at the intersection made by the Shaftesbury-avenue with that thoroughfare. The new avenue cuts obliquely across Bloomsbury-street, entering Oxford-street at a sharp angle. Close to this junction we have Museum-street, Hart-street, and Duke-street. Yet not one of these cross streets has helped to open the very secluded precincts of the British Museum, which is still cut off from the main thoroughfare. So spacious and important an edifice might have been easily approached if the avenue had been planned on rather different lines. Museum-street is narrow and dingy, though not without its associations. But we are rather concerned with the awkward junction of the avenue with Oxford-street, and the effect of this centre of traffic. One result of the change has been to bring the front of Broad-street Baptist Chapel, with its flanking towers and low spires, into view from Hart-street and High Holborn. But this view is more than spoilt by the jutting out of the block of buildings cut off by the new embouchure and the very awkward angles made, which might have been obviated if, instead of the detour to the right, the avenue had been turned into Bloomsbury-street, and had terminated at the Broad-street end. We do not say that this would have given the continued line with Hart-street that was kept in view in the laying out of Shaftesbury-avenue; but it would at all events have spared the demolition of several properties, and have avoided the very clumsy arrangement that it now presents in Oxford-street, and without any practical gain. The acute angles made by Hart-street with Oxford-street on one side and the avenue with the latter on the other are very disagreeable to the eye, and more

objectionable for traffic. In fact, as a business centre, the arrangement of streets at this point is extremely unfortunate, and many dangerous and awkward crossings are formed. The whole of the triangular space inclosed by Bloomsbury-street on the west, the avenue on the East, and Oxford-street on the north, ought to have been cleared and laid out, and the frontages ought to have been rearranged. But any suggestions on these points appear to be too late. Architecturally there is yet nothing done to redeem the awkwardness of the new approach from Piccadilly Circus. A much more sweeping and useful thoroughfare would have been to have carried it through Seven Dials across Drury-lane into Great Queen-street, which could have been widened at its eastern end into Lincoln's Inn-fields, thus skirting the Fields on its north side, and entering Holborn at the junction of Gray's Inn-road. Anyone who cares to trace this line upon a map will see that it would open up a now very closed neighbourhood, and would give a better approach to Lincoln's Inn-fields. That inclosure suffers from the same inconvenience of want of access which the British Museum has done; in fact, it is worse, for, as we have before hinted, there is no good access into it either from Holborn or from the Strand. One result from this seclusion has been that Lincoln's Inn-fields has been hopelessly left out of sight. The one redeeming feature is its quiet and suitability for hotels and lawyers' chambers. It has changed very little its aspect. On the west side of the square is a new very lofty stone building, for offices, of seven stories, which overtops the old adjoining premises, but is certainly no improvement to the architectural character of the locality. On the south side the College of Surgeons is the most important building, and this has been undergoing additions. A new attic has been added above the cornice, increasing the elevation of the façade. We may mention that the original college was designed by G. Dance in 1800; but the present building was remodelled by the late Sir Charles Barry in 1854, when the Ionic portico was added. As many of our readers know, it is a plain Classical structure with a well-proportioned cornice and Ionic prostyle. Mr. S. Salter, the architect, has done much to relieve the former severe plainness of the façade by placing angle pilasters at the ends of front, and by the addition of architraves to all the windows. It may be mentioned that the old front of the building is constructed of concrete blocks, and this has been refaced with cement, and the stone entablature and columns rubbed down. This process of refacing was necessary in order to make the new story harmonise with the old work. The new attic stories consist of new workrooms. The old top floor has been raised, and another floor added, which is appropriated as store rooms, including a photography room and a room for dissecting, lighted by skylights. There is a hydraulic lift at the back provided by R. Waygood and Co. Plans are prepared for further extensions, including a museum at the back towards Portugal-street and an extension of the library on the east side, and these will shortly be undertaken. The contractors are Messrs. Higgs and Hill. When the work is more advanced, we hope to be able to give a description of the new buildings. The old façade possesses a certain historical interest. It is mentioned by the late Mr. Fergusson in his remarks on the Classical revival. Barry found the old façade, with its portico of two stories, a very unprepossessing building, and he gave dignity and unity to the façade by the fine cornicione, which has been retained. The lower story of the new attic above the cornice is pierced by circular apertures, above which are windows. The angle pilasters break forward, and the cornice members are broken round them.

HENLEY-ON-THAMES SEWERAGE.

ON Thursday, Oct. 13th, a larger number of sanitary engineers, medical officers of health, and other officials of sanitary authorities were invited by the Mayor of Henley, Mr. Frederick Ball, to an inspection of the new sewerage works on the hydro-pneumatic system of Mr. Isaac Shone. The works were formally opened in the presence of an important gathering of representatives from other towns, and amongst those we noticed the Mayor and town clerk of Southampton, which town has lately adopted the Shone system with, we are informed, good results. The Henley authorities, like other towns situated in the valley of the Thames, have experienced some difficulty in getting rid of their sewage innocuously and harmlessly, and have been compelled to resort to a system of disposal that will not bring them under the censure of the Conservators of the River Thames.

The natural gradients were not in favour of the ordinary means of sewerage, and it became urgent that the sewage should be expeditiously removed. The sanitary authority availed themselves of the Shone pneumatic system, which is now well known to our readers, and has been successfully adopted in the Houses of Parliament. The system has been at work at Henley since February last, and, as far as we can learn, there is a general opinion that it answers well. The works comprise sewerage pipes of 7in. in diameter from the houses to four underground ejector stations, in each of which are placed two ejectors, one being in use while the other is intended for reserve in case of a breakdown; in addition to which there is an intermediate station where three ejectors are fixed, near the settling tanks and the compound engines, one kept in reserve for compressing the air, which is stored at a pressure of from 30lb. to 40lb. per square inch. The compressor, which is outside the engine-house, is a large tubular receiver, 6ft. in diameter and 27ft. long, and from it the compressed air is conveyed to each injector station by 4in. and 3in. pipes. We may mention that the air-compressing engines and boilers are near the settling tanks, being situated about a mile and a half from the town, at Lambridge Wood, where a large piece of wooded land has been selected and levelled for the purpose of irrigation. The outfall tanks and farm are about 130ft. above the level of the town, and it was necessary to force the sewage to this level. This has been accomplished by a double lift; the rise from the town station to the intermediate station is said to be about 80ft., and from thence to the tanks 50ft., making in all 130ft., but (including friction) the lift is equal to 140ft. The sewers from the streets of the town gravitate into the four pneumatic ejectors, each of which automatically, when full, admits the compressed air, which ejects the sewage at a pressure of 40lb. to the outfall tanks. Each tank holds, we understand, 150 gallons. Visiting the outfall, we inspected the compressing engines, each of 35 horse-power (indicated),, having two single-acting cylinders of 14in. diameter and of 21in. stroke, made by Messrs. Shone and Ault. There are two boilers, one of which is in use. The settling tanks are arranged side by side in three compartments each. When one is full the sewage passes over and under bridges into the second and third, where the sludge settles to be dealt with as solid manure, the effluent passing to the carriers, which distribute it over the land. The effluent was pretty clear, and its smell not at all objectionable. By the Shone system the sewage of 5,000 inhabitants is quickly disposed of before decomposition can take place. We are told that 150,000 gallons a day are dealt with, the ejectors being worked 12 hours per diem. The cost of the works has been £14,770, and we understand nearly £4,000 less than the pumping scheme proposed. Messrs. Ridley, Hughes, and Pratchett are the contractors for the work, which has been carried out under the direction of Mr. Isaac Shone, the engineer, of Westminster Chambers.

If the example at Henley can be taken as an instance of what may be done for towns similarly situated near a river, there is a strong case for adopting similar means of sewage disposal. The Shone hydro-pneumatic system has the merit of forcing out of harm's way, irrespective of natural gradients, the sewage of a whole town before decomposition can ta place, in utilising the sludge, and in making t effluent useful in fertilising sterile soil. Th can be done in easy stages without the gre cost of pumping engines. At Henley 7i drain-pipes jointed in cement have been use the old sewers have been disconnected, and no carry away only the storm water of the tow to the river; thus the expense of large ar costly sewers are avoided, and the separa system of sewerage is carried out. It is for loc authorities to take note of these facts befo committing themselves to costly systems large sewers and reservoirs for storage.

EDUCATION, CULTIVATION, AND EXAMINATION.*

(*Concluded from page* 574.)

IF we have now arrived at some clear under standing of what you require to prepar you for practice, the only questions which it re mains for me to deal with are first, the broa question of how generally you are to obtain it and the narrower one of how much of it yo can get here from me? I am not going t delay you in order at any length to examin any scheme of architectural education not a present in actual force, and within reach. Suc an examination you will find in the reports i the professional papers of the conference o education held in May last. I should, however like to refer, before I pass from the subject, t the programmes of instruction in several of the American Colleges which, through the kind ness of Mr. Cates, have been brought under the notice of many architects. In these programmes a course of scientific instruction is in each case provided, lasting several years, and taking, it is true, history and draughtsmanship; but without enough attempt, so far as I can see, at securing for the student any familiarity with buildings. I trust that if these are seriously examined as precedents, it will be by the help of the light thrown upon them by observations from the pen of Mr. Ware appended to them. The American schemes appear to me too theoretical, not artistic enough, and in other ways not suited as models for an English course of architecture, should such a course come to be established, as is very probable. It will be even less necessary to raise the question of technical education for artisans, which is one of the most important ones of the present day, though the subject before us to-night is, to a great extent, a branch of technical education, for it relates to the education of the architect for the exercise of his art, and time will not serve us to travel outside its limits. I propose to pass at once now to the question of how, with the opportunities that London at present offers, you can be educated for your profession? Even that stage of preparation which the Institute examination marks cannot be reached without *time*. To become a great architect is the labour of half a lifetime. We have, however, had great architects in this country, and have them now; so it is clear that whether our appliances and methods are the very best or not, that at least they can suffice. I once heard one of the greatest of modern water-colourists exclaim before a gathering of artists: "It is not, the water in the brush, but the spirit in the man that makes a painter in water-colours!" This is quite true; and if we take any great architect—say, Sir Charles Barry—it was the spirit in the man that made him what he was; still, the water-colourist does have water in his brush, and Barry reached his eminence by some path. Let us turn to the published memoir of him, and ask what was that path? Pupilage for a long term, travel for a long term, and then continuous effort—first to obtain, and then to carry out, responsible practice—is the answer that we shall obtain. Now, that simple programme will form the outline of the only course at present open to the architectural student of the present day, and I recommend both parts of it to your cordial adoption, not necessarily as the best possible programme—on that I offer no opinion here—but as the best possible in London in the year 1887; and I will endeavour to show how much pupilage and travel themselves can do for you, and what can

* By Prof. T. ROGER SMITH, F.R.I.B.A. A public introductory lecture to the Classes in Architecture at University College, London, delivered on Wednesday night, Oct. 5, 1887.

be done to fill out, add to, and supplement these two cardinal elements. With or without sound preliminary training, let us suppose that the student begins his career as a pupil. The life of Barry tells us that he was articled for and worked out seven years. This is not perhaps too long for a man to work at the drawing board, but it is too long to be in one place. The term now fashionable is three years, which is too short, and I believe that, as a rule, four years is a very useful term, and that then most men had better change, and spend two or three years seeing the practice of other offices as assistants, and, as a rule, as paid assistants. I have not much to suggest to pupils; but I ought to point out that what is really intended to be done for them is not to teach them as they were taught at school, but *to give them a chance*. In consideration of the premium he has paid, a young man who for a long time is more of a hindrance than a help is tolerated in a place where the work would go on better without him, and it is an understood thing that he is to be allowed opportunities of learning if he will use them. This—though it may not sound a very precious privilege—is really of far more value than most young men have the remotest idea of, and the great danger, especially for students who come straight from school and have not had the training in self-culture which college affords is that the opportunities may not be properly made use of. Let me urge on the notice of any pupils who may hear me, half a dozen or so of friendly hints:—first, to consider no trifle beneath their notice; secondly, to recognise that to acquire habits of punctuality, order, the mode of conducting simple affairs, endorsing letters, conveying messages, &c., are all essential to their success in after life as business men; thirdly, to do everything entrusted to them as well as they can, but as far as possible to secure the difficult jobs and pass the easy ones on to someone else; fourthly, to let nothing pass that they do not understand without extorting an explanation from someone; fifthly, to visit the buildings on hand and the builders' workshops whenever there is a chance; lastly, to make sketches and notes of every possible thing, insignificant or otherwise. A pupil who will spend his four years in this practice of this line of conduct will leave the office a good deal nearer being an architect than he entered it. It is, perhaps, right to add that though I may have given what does not seem a very brilliant account of pupilage, and though I am about to show that it must be supplemented somehow, I do not think that what it supplies can be got elsewhere. So practical a pursuit as an architect's business can, I think, only be learnt by taking part in the actual conduct of it; and though many pupils would do better had they spent some time in preparatory study before being articled, I see no reasonable prospect of any system being introduced to supersede pupilage without great disadvantage. In the pupil's career I include any subsequent time spent in somewhat similar work, though under the name of an improver or assistant. A still more useful addition to a pupil's course is a time spent in a position somewhat analogous to that of a clerk of works, or as resident assistant to a clerk of works, or as resident draughtsman on some building. Naturally, this is a rare chance. Very few pupils of five or six years' standing, if any, are really fit to be of much service as clerks of works; but if they can in any capacity spend some time on a building, they will find opportunities for acquiring practical knowledge there which are invaluable. Let us now inquire what advantage the student ought to be able to reap from pupilage, and from that kind of extension of it which I have sketched. First, as to Buildings, our first head. He will learn little or nothing of their history, and in the ordinary course he will see little or nothing of old buildings, but he will have opportunities in a disjointed way of acquiring familiarity with many of the features, ornaments, mouldings, decorations, and with the general design of the buildings in course of erection by the architect to whom he is articled, and not unfrequently with the design of some ancient buildings, as shown in prints, books, photographs, and sketches—Classic, Gothic, or Renaissance according to the proclivities of his master. He ought to have the opportunity of acquiring a pretty thorough knowledge of ordinary construction, and in some cases of special construction, and of learning how to specify and how to make approximate estimates. He will be sure to have opportunities of learning something about materials; but probably most of them will be wasted unless he gains elsewhere some general systematic familiarity with the subject theoretically. He may get some acquaintance with the appearance of buildings in course of erection, and of course it may happen that he may come into contact with old buildings in course of decay; but this experience is generally reserved for later days. I pass on to my second head, Familiarity with Men and Affairs. In a large office a pupil rarely has anything to do with men and not much with business. In a small office, the pupil often has to see people, and to devote part of his time to letter writing or accounts and writing out reports, from all of which engagements he will by degrees learn that valuable familiarity with men and things which we term business habits. If he is at all observant and does his best to make himself useful, and especially if he writes a good hand—a valuable, and, I regret to add, a rare acquisition—he ought to become perfectly familiar with all the ordinary business documents that an architect has to do with, and so when he enters upon practice this part of his office routine will be at his fingers' ends. Much of the proper dealing with *men* must, however, be learned from his actual responsible contact with affairs in real life. My third head was Drawing and Art. If a pupil goes into an office properly prepared, or, at least, well up in drawing the figure, and he has fair abilities, four years ought to make him at least a fair draughtsman. If in four years he thoroughly merits the praise of being a really good draughtsman, he has done well. The routine of preparing drawings from first to last should be familiar to him, and he, generally speaking, will have had an opportunity of making himself acquainted with perspective. Making designs is another matter: it depends upon other things than office work, and will not be learned in the office. As to art, as applied to buildings, or as seen in painting and sculpture, if the student is articled to an artist, and artistic work is being done during his term, he ought to gain much artistic training from office work. If (as is often the case) there is little going on to teach him fine art, he has to look for it elsewhere, and he need not look in vain, for many of the best artists in our profession have been brought up in offices where they had little chance of learning the fine art of architecture, though fortunately for them the technical art of building was learnable thoroughly. If I am correct in the view I have taken, it seems that the student unavoidably, and in the nature of things, is to look elsewhere than to the architect to whom he is articled and the associates with whom he will work in the office for preliminary preparation and for several important parts of his training. As for preliminary preparation, it is impossible for an architect to have too good an education, and I wish that every student were a graduate of one of our Universities; but, at any rate, I hope that most will have obtained a thorough English training, with a good knowledge of, at least, one modern language, a fair amount of mathematics, and the elements of some of the natural sciences, that is to say, physics, and, if possible, geology and chemistry, and last, but not least, that they will be well grounded in drawing. It is seldom that a youth or his friends select architecture for his profession without his having some amount of skill in drawing; but it has rarely been carried far enough. The student should be able to draw the human figure from the antique fairly well, and ought to know something of perspective and landscape. If he has not advanced at least as far as this, it is better to spend some months at a drawing school before entering an office at all. Some actual work in a joiner's shop is not a bad preparation for pupilage. Whether any part of this, which I call preliminary work, has to be taken up in addition or not, the following portions of the equipment I sketched a short time back must, it seems, be got elsewhere then at the office. As to Buildings: Their history; much of their construction, materials, and science, and the superintendence of work. The study of existing buildings. As to Drawing and Art:—Design and the refinements of draughtsmanship, and fine art generally. As to Men and Affairs:—All those parts of the conduct of practice which lie beyond ordinary routine, including the law of buildings. The most important of these is the study of erecting buildings, and I wish with all great emphasis to lay down distinctly the truth—sometimes I fear forgotten — that to study the buildings you must go to them. The knowledge about buildings which lectures, books, photographs, and prints convey, is not a knowledge of buildings. You must see, study, and sketch them. There is very great advantage in a student, after a sufficient number of years have been spent in preparing himself, taking a tour, an extended tour, and a continuous tour through as many of the regions of Europe that are architecturally rich as he can, and if it can be extended into the East so much the better. This sort of tour has, I think, fallen in the estimation of students partly because the facilities for short trips are now so good, partly, I think, because many men during the last 25 years have practised little else than English Gothic, and such have been contented to limit their studies to this country, with perhaps a visit or two to France, Belgium, and Germany. But the star of English Gothic is setting, and the student cannot afford to neglect Classic, Renaissance, Romanesque, and Byzantine examples, such as he must cross the Channel to study; and for good reasons which I cannot stop to go into here, six separate trips of a month each do not do one half, probably less than half, the good that one tour of six months will do. Some building or buildings must at some time be examined very thoroughly. I am disposed to think that the balance of advantage is on the side of comparatively few good examples most thoroughly investigated rather than a large number less completely studied. Each building selected should be measured and drawn out in detail, so that the drawing would suffice to re-erect the building, or the parts of it which are of architectural merit, if it were burnt. It is obviously convenient in many cases to select some English building for this kind of analysis. Of course, a much larger number of buildings must in addition be less thoroughly treated. Though I have urged the long Continental tour as desirable—and, let me add, most enjoyable—it must not be supposed that short periods of study of buildings near home are not great helps. Never lose a chance of visiting, examining, and drawing good work, old or new. There is a certain amount of very good old Gothic, and fairly good old Renaissance, to be met with in London, and the best modern work of both sorts here is quite as well worth study as the old, only let it be the best. London also presents opportunities of study in museums, of which, I think, few architectural students avail themselves as they might. We have antique work in the British Museum. We have an unrivalled collection of decorative work, and Renaissance and Oriental specimens at the South Kensington Museum, where there is also a magnificent series of casts, including many that would form excellent studies for architects. At the Architectural Museum there is a rich collection of Mediæval architecture; and at the Crystal Palace a series of casts and models of every age, the Renaissance, Byzantine, and Gothic being very good indeed. In all these places students who want to work can get leave to draw with very little difficulty. I now turn to the other points in which the student of architecture requires help. First, I am bound, I think, to refer to that provision which this college has made for assisting him, a provision of which I am proud to say that in the past a large number of men now successfully pursuing their practice, and in later years numbers of men whom I hope to see successful in life have availed themselves. Those portions of your necessary studies in which you can be helped by attending classes here are—(1) The history of buildings. This, with an examination into their features, details, and the growth and metamorphoses of architectural styles, forms the subject of the A. or art course here. I do not pretend for a moment to have time, in a session of thirty evenings, or the ability to tell the students all they require to know; but I claim that the course here gives a systematic and connected view of the history of ancient and modern architecture. I endeavour to make the sub-

ject interesting, and prefer to content myself with only taking up as much as can be done thoroughly, rather than to attempt to get over too much ground. There is a magnificent series of diagrams, which are lent to students to work from as well as hung up in the room, and I have endeavoured, with a success of which I confess I am a little proud, to induce the students themselves to draw illustrations of the subjects of the lectures.

The Materials and the Construction of buildings form the subject of course B., and here, as in the history of architecture as an art, I am far, indeed, from attempting to cover the whole field; but the course is consecutive, systematic, and thorough; it takes up all the principal building materials, and how to use them, and I endeavour to make sure work as we go. From both these courses I believe students derive this advantage, that they have planted in their minds a sufficiently connected view of the art in the one case, and of construction in the other, for them to be able to appreciate the meaning of every fact which comes under their notice either in their reading or sketching, or on buildings; in other words, that beyond direct gains they are enabled to get advantage from many other sources of information which would otherwise be of less service. I desire to state very plainly that these courses are not so much directed to enable students to pass the examination at Conduit Street as to give them a real help in their education as architects; but I believe that in this way they will more efficiently aid those who are going in for these examinations than if I attempted to shape them exactly to fit the course of the question papers. I think, too, the final examination at the end of the term, and an intermediate one, which it is usual to hold, are of great service to those who are preparing for the Institute examination, by enabling them to see how much they are able to accomplish in answering a previously unseen paper of questions on architecture within a fixed period, and quite without assistance. I am sometimes asked if these courses give enough information to enable students to pass those divisions of the examination to which they respectively relate. My answer is, that it depends upon the student. If he simply attends and takes some notes, and does nothing else—Certainly not. If he attends and gives time and study at home to the subjects, and tries to make all that he heard in the classroom his own, and then to pursue the lines suggested for further private reading at points where want of time obliges one to curtail part of a subject—Yes. Not, however, forgetting that personal familiarity with some architectural buildings is absolutely essential to success in the examination. Course C. proposes to give such information on the general conduct of building operations and architectural practice, and on some of the laws respecting buildings, as is most needed by men beginning practice, including some notice of the supervision of building works, and the decay of buildings and the measures to be taken to secure dangerous and ruinous structures. Here, again, I think that by giving what is most serviceable to the young architect, I am doing my best for him in his preparation for his examination. Here the work of this college stops; but I have little hesitation in saying that it will help you in the departments to which it is directed to master your subjects more thoroughly than by solitary study you easily can, and that what you will learn in this room is adapted to form the groundwork upon which you own further work may usefully stand. I regret that time warns me that I must condense as far as possible what remains for me to say, and give you bare references in place of stating matters at length. Before leaving this college I must point out that some of the sciences bearing upon architecture can be well studied here, and that the Slade school affords excellent means of instruction in drawing the figure, though in neither case are the courses specially arranged for architects. Some particulars of these will be found at the foot of the prospectus of my lectures. At King's College Professor Kerr gives a course of lectures on the Arts of Construction. His ability and his long experience as a public lecturer are too well known for it to be requisite that I should say more to point out the value of the course. The most important subject remaining, Architectural Design, is to be learned best at the Royal Academy. One must be a good draughtsman to get in; but here not only is good drawing made better under the eye of that accomplished architect and teacher, Mr. Phené Spiers, but design is practised under the personal direction of the very first architects of the day, those I mean who have the honour of being members of the Academy. No opportunity so good as this exists, and no better opportunity well could be devised for students to acquire skill in design; and quite apart from the medals and prizes, this is enough to repay you for any trouble taken in obtaining admission. Next, I must refer to the Architectural Association and its work, a subject so considerable that I cannot do more than glance at it on general terms. A students' mutual improvement society, numbering about 1,000 members, with a library and at least a dozen classes and courses of lectures, and its own travelling studentship and series of valuable prizes, it is an organisation of great importance and with vast possibilities for good. I hope you will all belong to it, for from it individual portions of your architectural equipment can be well obtained. It is sometimes said that there are imperfections connected with the scheme of the Association, the most serious being that the work is to a certain extent fragmentary, and in the nature of things unequal, and that some of the amateur teachers are not practised instructors. Whether this be so or no, the facilities offered are very many and very great, and especially so in that all-important branch of your studies, the study of design. The elementary class of design, the class of design, and class for colour decoration are worthy the attention of you all as open to you before you can enter the Royal Academy, and to these classes many an architect is indebted for his first opportunity of learning and practising design. The practical side of our art is studied by the members of the Association in many classes, each good in its way, and each taking up a useful portion of the work The visits to modern buildings, which are organised by the Association, are a means of learning how the best work of the present day is being done, and in themselves would be worth joining for. In the Brown Book of the Association you will find the whole programme set forth, and there, too, you will find the regulations and programmes of all the other organisations which I have to allude to. Let me recommend to your notice the page of advice to students which that pamphlet contains, and to your practice the personal consultation with a member of the committee of advice which it suggests and recommends. Among the announcements in the Brown Book, one will appear for the first time which I should be glad to believe will be continued for many years—the studio established by Messrs. Baggalay and Millard. This new and as yet untried venture, is fortunately in good hands, and if proceeded with ought to afford admirable assistance to students in draughtsmanship and design, and I hope also in construction. The Royal Institute of British Architects does not give any courses of instruction, but it possesses the best architectural library in London, and this is now accessible without charge and without more than the needful formalities to all working students of architecture, including students at this college. The City and Guilds Institute has given in the month of July short courses of lectures on subjects, most of which are of value to architects. These, no doubt, will be repeated next summer. The establishment at this Institute of various classes bearing on our pursuits is in contemplation, meantime a class of exceptional instruction in masonry was conducted there last session by Mr. Harvey, and this subject is to be pursued together with the allied subject of descriptive geometry, under the same teacher this session. The instruction given by Mr. Harvey is spoken of by those who know most about it as exceptionally good, and there is nowhere else where the same subject, treated from an architect's point of view, is taught so thoroughly and practically. Here I might well end, were it not that I know that this address, or much of it will, by the courtesy of the professional press, be read by students who cannot get to London, or who, being in London, cannot see their way to getting to Gower-street or Conduit-street. To any such I should like, with your permission, to address a parting word, and to say, "Courage, my friend. Remember, it is 'the spirit in the man, not the water in the brush'"; and though I have spent the evening describing useful aids to study, there are few of them which a resolute and energetic student cannot dispense with. What I take to be absolutely essential is first work in an office, and that I take it you have; secondly, buildings to study, and there is hardly a parish in England where there is not at least a fragment of the noble Mediæval architecture of our country within your reach; thirdly, books, and of those you must manage somehow to get hold of a few, but if your choice be not large you must the more thoroughly master the ones you have; and, lastly, the instruction in drawing. That happily the schools of art have spread through the country. Read, I pray you, the "Advice to Students," issued by the Institute of Architects, and appended to the programme of the examinations, and you will notice that there is but scant reference to the London advantages which I have dwelt upon, though I have good reason to think that the Board of Examiners are not insensible to their value; but that the course pointed out is one which a student, with comparatively little aid, may fight out for himself. Still, I am quite sure that the aid offered here and elsewhere will make that course easier, shorter, and, I think, surer. In taking leave of the subject and releasing you, let me revert to what was said earlier in the evening upon cultivation. I trust that each one of you will not simply learn his profession and push his way, but will cultivate his mind, and so successfully that he shall be known, not merely as a safe constructor or a brilliant designer, but as a man of taste, of judgment, of varied knowledge, of some accomplishments. In short, that he shall be an ornament to his profession.

LIGHT AND AIR—THEIR IMPORTANCE.

IT is essential that architects should have some knowledge of the law relating to light and air, and other divisions of the law upon which they are often called upon to decide between two different owners of property. How can a right of light and air be respectively acquired; how should it be preserved when acquired; how might it be jeopardised, and how lost? These interesting questions, says the *Yorkshire Gazette*, were laid before the closing meeting of the Society of Architects by Mr. F. A. Camidge, solicitor, of York. In olden times an owner, after an uninterrupted possession of light and air during a long period, could not be interfered with unless it had been enjoyed by him during that period by some privilege granted to him. This had been modified to some extent, and an Act of Parliament showed that the right to access and use of light should be deemed absolute and indefeasible, any local usages or custom to the contrary notwithstanding, after an enjoyment for 20 years, unless the same was enjoyed by some consent or agreement expressly made or given for that purpose by deed or writing. This fact, however, made no provision for the acquisition of rights of air. Light and air are *res communes*, things in which no permanent property can be acquired, and which everyone may use and enjoy whenever he has an opportunity so to do, but in which no one can acquire a future property. The opening of windows so as to overlook the private grounds of the adjoining owner, or even to command a view of the interior of a neighbour's house, and so lessen the value of his property, is not considered by the law as a wrong for which any remedy is given. No right to access of air over the general unlimited surface of land can be acquired by mere enjoyment. Chief Justice Wray has said that no action would lie for stopping the prospect of a house over vacant land. Mr. Camidge also refers to the other means of acquiring rights and light of air, which were by express grant—that is, by deed, or even by an agreement in writing, or by implication, which may be gathered from the peculiar circumstances of each case. A railway company has no power to stop an adjoining owner from acquiring a right of light so long as it does not interfere

with the working of the railway. As to how far the pulling down of a building might jeopardise the rights of light, there must be clear evidence of the intention to abandon the right to light before the Court would decide that such right had been lost. One important point to be considered by architects is that they cannot build so as to block out a new light if this would interfere with an already existing ancient light. In the case of old property, a plan or photograph should be kept of the ancient lights before the property is pulled down, and in this way prevent any question being raised afterwards as to the right of light. Where a person having built a structure on his own land sold and conveyed it in an unfinished state, with merely openings in the walls for the insertion of windows, such person could not afterwards build on his own adjoining land so as to obstruct the access of light and air to the space left for the windows; or where two persons buy two unfinished houses from the same owner with the space for windows and doors marked out, this would be sufficient indication to the purchasers of the rights they were respectively to acknowledge. If a person pulled down his building and erected a blank wall without any windows, and after a long lapse of time his neighbour erected a building near to this blank wall, the owner of the wall could not afterwards claim the restoration of the ancient windows, and it might be presumed that there was sufficient intention to abandon them by manifest disuse. Easements of light and air might become extinguished by abandonment and release, and also by unity of possession—*i.e.*, where a person owned a house and the adjoining land, the fact that he was the owner of the dominant and servient tenements. There is really no fixed rule as to what might be considered sufficient privation of light upon which to base an action, but the person who complained must be prepared to prove the substantial privation of light sufficient to render the occupation of his house comparatively uncomfortable, or to prevent him from carrying on his business as beneficially and profitably as he had formerly done. The mere diminution of a ray or two of light will not suffice for the maintenance of an action.

THE DICTIONARY OF ARCHITECTURE.*

WE have received Part XXII. of this dictionary, which now brings the work down to within a measurable distance of completion. The part comprises the letters R—S, and is issued with title-page, table of contents for Vol. VII., and list of terms for the concluding part, T—Z. A notice to members is prefixed to the work announcing that the entire cost of the present part has been about £750, exhausting all the available funds. It is estimated that to complete the dictionary £650 is required, and an appeal is made for a subscription of at least £2 2s. from members, except those who have joined since June, 1875. The text of the part we have received is from "Raab" to "Szucoalkach." These two terms are an instance of the comprehensiveness aimed at by the compilers. We have before questioned the wisdom of including names of places of only interest to a very few archæologists, and of many terms which pertain more to engineering than architecture. Some of the terms introduced would have been usefully omitted to make more room for others of architectual importance. A few of the biographical notices might, for example, have been left unnoticed, yet we know the difficulty of the compiler of a dictionary as to what terms ought to be included and where the line should be drawn. The editors have thoroughly fulfilled their part in rendering the dictionary comprehensive. The articles are not too long, briefly giving the definition, with references to works where fuller information can be found. Under "Rainfall," we have a brief account of the mean annual quantity. The average in London is given as 25in., in the driest parts about 18in. The maximum rate of fall is given as 1in. per hour. We read: "On 10th April, 1872, the rainfall in London was 2in. (at Greenwich, 3in.) in about nineteen hours. Between midnight of 25th July, 1867, and 10 in the morning 3·18in. fell an amount unprecedentedly large for London; thus ⅓ of the average rainfall for a whole year fell in 10 hours." Again, "an inch of rain" means a gallon of water spread over a surface of nearly two square feet, or a fall of about 100 tons upon an acre. The mode of calculating the quantity over a given area and other useful memoranda are given. There is a long paragraph of references to reports and treatises. We see our own pages have been referred to in this and the succeeding articles on tanks and cisterns. In the latter we do not see any reference to Roberts's Rainwater Separator, which is an important modern appliance. Under "Ravenna" is an interesting list of churches, in which references are made to Hubsch and other authorities. Short articles on Red Corsehill Stone and Red Timber appear; here, too, this journal has been referred to. Some research and a list of examples are to be found under the word "Refectory," and the article on "Renaissance" is exhaustive, and contains a very complete list of works on the subject and examples. Articles on "Responsibility," "Restoration," "Romanesque," "Rome," "Roof," "Round Churches," "Round Towers," and "Russian Architecture" appear. Under "S" we find well-compiled articles on "Saracenic Architecture," "Saxon," "Screen," "Sound Proof Construction," "Synagogue," &c. Biography occupies too much room, and not a few terms are obsolete. The article "Stability" is concise, but not so clear as it might have been. The finding of the stability of any structure would have been more accurately expressed as the taking the resultant of all the pressures and its line of action, and comparing the moment of the force tending to overthrow the structure with that of the centre of the gravity of the mass. On the whole, the editors are to be congratulated on the success of their labours, and the learning and research shown in the new part. The work when completed will be, with all its faults, the most complete and comprehensive dictionary of architecture in the widest sense of the term probably ever published in this or any other country. It covers a large range of subjects beyond architecture pure and simple, and is therefore more generally useful to the allied professions.

* The Dictionary of Architecture, Part XXII., R—S. London: Whiting and Co.

THE SANITARY ASSOCIATION OF SCOTLAND.

THIS Association held its thirteenth annual meeting in the Burgh Court-room, Falkirk, on Friday. Mr. George A. D. Mackay, Paisley, presided, and there were about seventy delegates present from public bodies in different parts of Scotland. The President delivered an address, taking as his subject "Helps and Hindrances to Sanitation," in which he urged that if the full tide of physical and mental health was to have sway in these islands, the way of the sanitation must be more fully cleared by the statesman and the social economist. Dr. M'Vail, medical officer, Kilmarnock, read some "Notes on Sanitary Legislation in England and Scotland." The Scottish Act of 1867 was, he observed, eight years earlier than the English one, and in these eight years much progress was made in knowledge regarding public health. In both countries the law had too much "may" where there should be "must." The proposed new Public Health Bill for Scotland was much needed, and in many respects its provisions as drafted were excellent. The most important defect of the Bill seemed to him that its action was restricted to populous places. It might be urged that the Bill should be judged on its merits as a Burghs Bill, but unfortunately the proposed Act, like the local Acts already passed—would silence for a long time any national demand for sanitary reform. If the Bill became law in its present form it would be at the cost of an incalculable amount of preventible sickness and unnecessary death in the rural districts of Scotland. He urged that means should be taken to rouse our legislators to a sense of the pressing importance of a broad and inclusive measure of sanitary reform. Bailie Russell, Edinburgh; Dr. Simpson, Perth; Bailie Smith, of Greenock; Bailie Arthur, Airdrie; Mr. Andrew Wallace, inspector of the poor, Govan; the Rev. M. Scott, Camelon; and Mr. M'Leod, Greenock, discussed and criticised the paper, after which Dr. M'Vail replied. Mr. Kenneth Cameron, sanitary inspector, Aberdeen, contributed a paper on "Sanitation in Aberdeen." Within the last few years Aberdeen had appointed a medical officer, who devoted his whole time to the duties of the office, and he himself, as sanitary inspector, had eight assistants. Last year the town council adopted regulations for house drainage and the ventilation of dwelling-houses, the smoke test being also vigorously applied to all drain and pipe-work. The result of the sanitary improvements was a considerable decline in the Aberdeen death-rate, which had fallen from 23 per 1,000 in 1869-73 to 19 per 1,000 in 1884-86. A short discussion followed as to the system of sanitation adopted by different local authorities. The members of the Association and others afterwards dined together in the Crown Hotel, under the presidency of Mr. George Mackay, Paisley.

REREDOS, NEWCASTLE CATHEDRAL.

MR. J. SHERWOOD WESTMACOTT, the sculptor, has this week exhibited, at his studios near Eccleston-square, the statues which he has executed for the new reredos to the High Altar of Newcastle Cathedral. This piece of work is entirely in alabaster, and rises to a height of over 21ft., including the three steps of the Sanctuary. The style chosen by the architect, Mr. R. J. Johnson, F.S.A., of Newcastle, is a Late type of Gothic, rich in canopies and intricate tabernacle work, designed with refined taste and an intimate knowledge of detail. Shortly we hope to illustrate the choir, showing the new stalls and bishop's throne, with other fittings, just executed. The east window has been designed by Mr. E. Frampton, and we shall in the course of a week or two also illustrate his drawing of this work. The reredos itself has been built by Mr. Beall, of Newcastle, who has likewise erected the Caen stone wings to the structure. These are in harmony with the alabaster centre-piece, though somewhat simpler in general character with panelling and traceries. The central figure representing the Majesty is a particularly good piece of modelling, full of dignity and refinement, the face of the Saviour King being highly dignified with well-defined features, whilst a telling outline marks the composition. Above the Majesty stands St. Cuthbert, supporting the head of St. Oswald. In the same range of statues rank the Venerable Bede with his book, St. Benedict Biscop, St. Oswald, King, supporting the cross with a shield in his left hand, and a palm indicative of Martyrdom; St. Edwin, King, also holds a palm for the same reason and supports a sword. St. Nicholas, the Patron Saint of the church, is the subject of a very handsome and central statue, holding the closed book, on which rest bags of coin. The four Evangelists, with their emblems, form a fine series of full-length figures, by the side of the Majesty, beyond them, being St. Gabriel on one side and the Blessed Virgin Mary on the other, in indication of the Annunciation, but the subsidiary way in which this idea is introduced renders it difficult to realise the intention. St. Wilfrid and St. Paulinus came below the two last. It will thus be seen that prominence has been given to Northumbrian Saints. A range of angels is placed immediately above the retable supporting shields bearing emblems of the Passion, and other angels occupy the series of small niches, which divide the composition into three divisions.

ANTIQUE STELÆ AT THE BRITISH MUSEUM.

THE old print room in the British Museum has been turned into a gallery of Greek and Roman sculpture, or, rather, for the display of a number of sepulchral stelæ, vases, urns, and fronts of sarcophagi of Greek and Roman origin, which have been disinterred from the cellars. Many of these possess an interest apart from their archæological value for the beautiful reliefs and sculptural decoration. Mr. Murray has done the best with his treasures. Four of the large stelæ have been let into the walls of the gallery, where they have the advantage of a full light to throw up the reliefs. These represent figures, one a parting scene, from Delos, presented in 1825. At the end of the room is a fine example of a relief

An entablature supported on twisted columns forms the framework of a series of heroic figures sculptured in high relief, the base of which is enriched by a guilloche and other ornaments; and there is a pleasing sculpture of "The Nine Muses," the figures introduced separately in an arcade supported by twisted columns, the capitals in some cases hung with masks; the slab was no doubt a sarcophagus front. On the window side of the room is a torso of Triton from Delos, removed from the Phigalean room—a portion of a colossal figure, and at the other end of room is a beautiful example of a votive monument erected in honour of Lucius Antistius and his wife, Antistia Plautia, by the freedmen Rufus and Anthus. The heads are in alto-relief in shell-like circular niches, which throw them out in full relief. The niches are encircled by laurel wreaths. On the same wall are some interesting sarcophagi reliefs. In groups on the floor many very interesting stelæ are to be seen, and the collection of George, Earl of Aberdeen. Many of these stelæ and sculptures have been stored away in the cellars of the Museum since the middle of the 18th century, and they now have been brought to light for the first time, and appear as rediscovered antiquities. Several of the larger stelæ let into the walls are yet unnamed, and it is probable that their history has been lost. These sepulchral monuments, together with the new Mausoleum gallery, have increased much the interest of the British Museum to all students of classical archæology. A few of the reliefs and stelæ are Greek of the best period, if we are to judge by the ornamentation and style of the drapery of the figures, while the larger number of them belong to the Roman school. It will be an advantage when they are arranged and dated, if the latter is possible.

EFFECTS OF VARIATION OF TEMPERATURE ON METAL ROOFS.

IT is a matter of observation that metal coverings on roofs are liable to a creeping action by the variations of temperature. Prof. Tyndall, in "Heat as a Mode of Motion," refers to the roof of the choir of Bristol Cathedral, which was covered with sheet lead in 1851, the length of the lead being 60ft. and its width 19ft. 4in. Two years after the above date it had bodily moved down for a distance of 18in. An attempt was made to stop this movement by driving nails into the rafters, but the force of it drew out the nails. The roof is not steep. The cause of this sliding down was to be attributed to the expansion of the metal during the day-time in one direction. On a flat surface the lead would have expanded all round equally, but the inclined surface caused it to expand only downwards. The contraction during the night drew the upper edge downwards by the same force of gravity. According to mathematical demonstration, a metal plate will begin to slide when the angle of inclination is about 18° 26′. In point of fact, there must be some temperature required to overcome the resistance of friction between the lead covering and the wooden hoarding. But the resistance of friction, or the coefficient of friction, varies for different materials. Thus a covering of sheet-iron or zinc has a less resistance than that of lead, and would thereby require a flatter angle to overcome the sliding movement downwards. It has been calculated that a temperature of 541° F. would be necessary to overcome the friction between lead and wood with an angle of 4°, whereas only a temperature of 22° is required to overcome the resistance between sheet-iron and wood at the same inclination. This movement or "creeping" of metal on roofs of a certain angle is one objection to its use. Many of the lead roofs of cathedrals and old churches show this creeping downwards, and in many instances a wrinkled appearance is given to the covering. Trusses of iron are liable to movement caused by expansion. Thus a roof of ordinary construction, of, say, 100ft. span, ought to be so fixed as to be capable of free movement at one end or support under a certain range of temperature to which it may be exposed. Assuming this to be 160°, the expansion will equal about 1¼in. In a curved iron roof, like many of those of our large railway stations, provision ought to be made for the greater expansion of the curved rib as well as that of the tie-beam; in other words, there will be a vertical as well as horizontal expansion to provide for. In practice the irregularities and inequalities of the joints doubtless allow any action arising from variation of temperature to take place without serious mischief, though it is not safe to fix rigidly both ends of a truss.

PERMEABILITY OF BUILDING MATERIALS.

IT is well known that bricks, stone, and even cement are not only porous, but allow vapours to pass through them. Some time since a French *savant*, M. Marcker, made experiments with a view of testing the permeability to gases of certain materials. He found that granite, porphyry, slate, alabaster, and limestone are practically impermeable. The question of transpiration is an important one. Houses built of impermeable walls are dry, though it is doubtful whether, under all circumstances, they are the most healthful. All will admit, however, the advantage of cutting off by a really impermeable layer the house, so as to avoid gaseous emanations from soil that is not of virgin quality, and the gases from drains. For such purposes we require impermeable materials. Of all that we know, the best asphaltes and the bituminous compound known as White's Hygienic Rock Composition appear to be the most perfect and easily applied. Concrete, however well made, is not so completely impervious to vapour, and even cement has been found to allow vapours and gases to pass through them. With regard to walls, the cements that are used give all the required impermeability. A thick glazed paper is said to reduce the permeability of a brick wall nearly 40 per cent., and two coats of oil paint considerably help towards the object. A new kind of wall decoration has lately been introduced from France, which consists of thin sheets of metal painted over by a patented process. Tinfoil in sheets is the material used, and this is gilded or painted over. The covering is waterproof, and, we should say, is an excellent substitute for paper on damp walls.

CHIPS.

Mr. Joseph Edward Binns, builder, of Raglan-road, Woodhouse, Leeds, died on Friday, after a short illness. He was fifty-eight years of age, and carried on a large business as a contractor in Leeds and its vicinity. For the past eight years he has been a member of the town council, and for the last four years chairman of the Building Clauses Committee, in which his business experience enabled him to render the town good service.

A gold medal for Portland cement, has been awarded at the Havre Exhibition to Mr. R. W. Cooper, of Strood, manager of the Medway Portland Cement Company.

A steam tramway, connecting the North-Eastern Railway system with the fishing village of Flamborough, is about to be constructed by a private company, of which the Earl of Londesborough is one of the principal promoters.

The Torquay local board, having recently purchased the harbour and other property from Lord Haldon at a cost of £75,000, are about to apply for Parliamentary powers to expend an additional £50,000 in increasing the harbour accommodation. The principal outlay will be in the construction of a pier to shelter an area of 40 acres from the westerly gales.

A liberal club in Leeds-road, Bradford, was opened by Mr. Isaac Holden, M.P., on Saturday. The building has cost £1,400, and has been built from plans by Mr. T. C. Hoper.

Mr. Thomas Codrington, M.I.C.E., an inspector of the Local Government Board, held a public inquiry at South Stockton on Friday into the application of the local board for sanction to borrow £7,248 for private street improvements, £180 for public street improvements, and £400 for the purchase of land for offices.

The foundation-stone of the north wing of the High School at Stirling was laid by Lord Balfour of Burleigh on Saturday. The school was erected in 1854, and a south wing was added in 1873. The present wing is being built at a cost of £7,000, from plans by Mr. J. M. McLaren, of London, an old High School pupil, whose design was selected in competition. It comprises workshops and gymnasium in the basement, classrooms and library on the ground floor, with science and art rooms above.

WAYSIDE NOTES.

THE decision of the Metropolitan Board of works to contribute one moiety of the purchase-money of Parliament-hill appears to have been seconded by public opinion, and is to be commended, since the hill is one of the most interesting places round the Metropolis. Long before the purchase of the hill was decided upon, it would have seemed to have been, to all intents and purposes, in the hands of the public—the *juvenile* public at any rate. Last summer, when the mowers had just finished cutting the grass, I remember seeing the children "hay-making" in a fashion that must have been, doubtless, rather dispiriting to the owners thereof, the aforesaid hay-making consisting of the roughest horseplay in the new-mown grass. Let us, then, welcome the prospect of a public Parliament-hill, that the youngsters may in future rollick and tumble about thereon to their hearts' content.

It is not often, however, that I find myself on Parliament-hill, but when I do I enjoy the prospect and breezy situation immensely, by day, when one can see the maze of towers, spires, and chimneys rising from amongst the rolling masses of smoke-cloud; and on a clear night it is certainly very pleasant to watch the glimmering "lights of London" and to listen to the dull roar that surges up from the great city in the plain below.

I recommend to the notice of those persons who talk about a fever "epidemic" in London a letter of a correspondent of the *Times* of Monday last. He describes the condition of the village of Burnriggs, some six miles from the city of Carlisle. About one-third of the population of this little village, of between 120 and 130 inhabitants, have been laid low with fever of one kind or another. Typhoid has been followed by scarlet fever and measles; and most harrowing are the details supplied by the writer. When we read of a village being shunned by all persons excepting the clergyman and his wife, and a few doctors, we may truly talk of an epidemic.

The sad state of affairs at Burnriggs is said to have been brought about by a polluted well Scarlet fever being essentially and emphatically a *dirt disease*, there is little wonder that when a village draws its water supply from a foul source a terrible scourge should fall upon it. Nor is our surprise lessened when we read that one of the sufferers was unable to open his window on account of the stench from a nuisance within a few feet of it.

In the same edition of the *Times* there was a letter anent the condition of the river Cam. The state of this water-way is described as "filthy and disgusting," and more so than it has been within the last 13 years. The writer lays all the blame at the door of the Improvement Commissioners. Again, on Saturday last I observed an article in the *City Press* headed "The Deadly Lea," which also is described as "filthy and disgusting" between Tottenham and Lea Bridge. This nuisance, also, is said to "call for the severest condemnation and official censure upon the responsible authorities." Really this sewage question is of most serious moment, and, unless grappled with, will leave the Metropolis and many other cities and towns in constant danger of a veritable and appalling epidemic.

The Institute of Auctioneers and Surveyors of the United Kingdom will hold a meeting on the 26th inst. for the purpose of discussing the best way of advancing the interests of the Institute, and, it is to be presumed, their professional brethren generally. With all due deference to this honourable body of auctioneers, I would most respectfully suggest that its members should make themselves acquainted with the details of the Architects' and Engineers' Registration Bill. They will thus become familiar with the appearance of the future frontier line that is to restrain their ambition in matters architectural. Pardon my enthusiasm, O worthy Mr. Auctioneer.

The Society of Architects' visit to York, as completely reported, must be considered extremely satisfactory. A very useful paper was that on "The Remuneration of Archi-

tects." I am quite with the author, Mr. Edgar Farman, as to the generally satisfactory nature of £5 per centum. After all, when one has plenty of work to base this calculation of 5 per cent. upon, we do not, as a rule, feel like quarrelling with the system; but when business is bad there is, we can understand, some excuse for complaint.

The Lord Mayor of York, I see, stated at the entertainment that he so hospitably provided for the S.A. that "he could not but be struck with a comparison of old work with that of modern times." Evidently, by the context, his Lordship intended to refer to the constructional side of the question only, and not the æsthetic. In "antient" times, Great Dignitary, there existed not the leasehold system as at present practised, and the ring of the jerry-builder's trowel was not heard in the land.

A few days back I had the *pleasure* (I employ the word advisedly) of examining some delightful productions of Mr. Buggins—three or four big houses in a Kentish suburban village, all tumbling about one's ears, and having to be underpinned, re-roofed, re-floored, re-ceiled, and plastered, and *only erected five years back!* Such things are, alas! but too common in "small" property; but in houses letting at £70 or so it is a little startling. But on buildings of this sort we must base all our hopes, since by such abortions the eyes of the public are gradually opened to the defects of the jerry-building system.

Scene: A building estate with some ground "got out." Time: A winter's morn, with the thermometer below zero. Mr. Buggins and a bricklayer discovered at work. They suddenly become aware of the near approach of the surveyor. Extraordinary behaviour of Mr. B., who, regardless of the chilly atmosphere, pulls off his coat and rapidly, but with design, spreads it carefully in the trenches. Enter to them the surveyor. Mr. B. (his teeth chattering), loq.: "Fine morning, sir." Surveyor: "Rather fresh, Mr. Buggins; I should put on my coat if I were you, you might get a chill." Mr. B.: "Oh! quite unnecessary, sir; rather warm this morning, sir!" (Tries to look overburdened with heat.) Surveyor: Well, suppose, Mr. Buggins, that you remove your coat from the trenches to please me." (Mr. B. hesitates, and then reluctantly assents. Underneath the garment are discovered several courses of brickwork, already hardening with the frost). Tableau!

We must thank Mr. Plummer for kindly giving us the information *re* Birtley Church. Certainly no room is wasted with the chancel-arch; but its width being 6ft. 8in., and that of North Witham only 6ft., the Lincolnshire building takes the palm for smallness by 8in. The book on Birtley Church referred to should prove interesting reading for a winter's evening.

The death-knell of one more City church is sounded. It is Old Jewry this time that is to fall before the tide of modern improvements. Long years ago the building was doomed, and the arrangements for its removal were, I believe, completed last December. Now, the dead are to be removed, and some feeling is expressed on this score, but I understand that as the vicar will superintend the arrangements there will be no scandal. And we pay more attention to these matters of sentiment nowadays than formerly, so that the "heirs, executors, friends, and relations of persons," as the churchwardens' notice quaintly sets forth, need not fear on this score.

In times past they occasionally mixed up old bones into an odd jumble. Were there not certain "rumpages" made in days gone by, when the overflowing vaults were ransacked and a medley of human remains gathered into a heap and buried wholesale? I fancy I have heard of such occurrences.

There cannot be said to be much material loveliness in St. Olave's Church, Old Jewry, and it looks very mournful just now, with the doors closed and the dead leaves from the few pleasant plane-trees around it strewed about the paths in wild profusion. Its external architecture is of a very hard type of Renaissance. One little, if insignificant, redeeming feature there is—its weather-cock, an apparently well-executed metal model of an old ship in full sail. It surmounts the staff at the top of the tower, which, by the bye, has been long dedicated to the service of Mammon, in that from it radiate myriads of telegraph and telephone wires.

CHIPS.

Mr. B. L. Wells, C.E., engineer to the Weaver Navigation, has been appointed resident engineer to the Aire and Calder Navigation at Goole.

A Jubilee memorial lamp and drinking-fountain have been erected in the square at Ringwood, Hants. Above the stone drinking-fountain rises a column carrying five lamps. The pillars which has been cast by a Glasgow firm, has been erected by Mr. George Etheridge, the steps and mason work have been laid by Mr. W. E. Alexander, and the cistern and cattle trough have been constructed by Mr. J. Armfield.

A block of public buildings are about to be erected, at a cost of £500, adjoining the new Crispin Hall at Street, Somerset. When complete the building will contain a fire brigade station, a place for the village hearse, a waiting-room, a pay-room for those in receipt of parochial relief, the caretaker's premises, and a board-room for the vestry. The builders are Messrs. F. Huish and Son, and the architect is Mr. Skipper, of Norwich. The foundation-stone was laid on Saturday afternoon.

St. James's Church, Thornes, near Wakefield, was reopened on Friday after having undergone alterations and improvements at a cost of £500. The work has been executed from plans prepared by and under the superintendence of Messrs. Simpson and Richardson, of Wakefield.

The foundation-stone of the new post office for Dumfries was laid with masonic ceremony on Saturday. The post office is being built on the site of the old prison in Buccleugh-street, Mr. Kirkland, of Ayr, being the contractor.

What is believed to be the oldest Jewish gravestone in Germany has just been discovered at Zahlbach, a small village close to Mayence. It served as a stepping-stone over a brook, but was observed to have some Hebrew characters inscribed on it. The Rabbi, Dr. Lehmann, of Mayence, had it cleaned, and found on it the date 4560 A.M., equal to 806 A.C. The stone has been removed and placed in the town museum of Mayence.

The magistrates of Colchester last week received plans from Mr. J. W. Start, architect of that town, for proposed new exits to the theatre. They have, therefore, appointed Messrs. J. and A. E. Bull, architects, Charing-cross, C.E., to examine the proposed plans on their behalf. Great structural alterations are required, including fireproof corridors and stairs, proscenium wall, &c. The magistrates have refused to grant the license until the works are completed.

At their last board meeting, the Directors of Robert Boyle and Son, Limited, ventilating engineers, resolved to recommend a dividend of 12 per cent., free of income-tax, on the ordinary shares of the company, for year ending September last.

The board of guardians at Stoke-on-Trent have accepted the tender of Mr. Joseph Blackburn, Gresham Works, Nottingham, for the erection of a telephone exchange at their Hackhill Workhouse and Hospital. The same firm are also engaged upon several new telephone lines; also the fitting of the new Fleming Memorial Hospital, Newcastle-on-Tyne, with their improved registered lightning conductors.

The Metropolitan Board of works decided on Friday after considerable discussion, to contribute a moiety of the cost of securing the land comprised in the Hampstead Heath Extension Act, 1886, such moiety not to exceed £152,000, and also £25,000 towards the purchase of Clissold Park, Stoke Newington.

A Roman Catholic church and presbytery at Burwash, Sussex, have just been built at the cost of Madame de los Heros. The presbytery is built after the Sussex fashion, with truncated gables, tall chimneys, and tile hangings. The staircase, windows, doors, and many other features of the old Hall, formerly occupying the site, have been used again in the new house. St. Joseph's Church, built in the form of a cross with three circular apses, is of stone and brick within and without. The two side chapels forming the transepts are domed in stone and brick, and have arcaded walls. The lofty nave is covered with waggon vaulting of pointed form, the chancel being groined. Mr. E. Thurbon, of Tunbridge Wells, was the builder; and Mr. Bernard Whelan the architect.

Engineering Notes.

Berwickshire.—A road improvement in Berwickshire has been brought to a successful conclusion in the erection of two bridges over the river Whitadder, and the construction of a new road on the main line of communication between Duns and Haddington. The new road from the Duns end commences at a point near Ellem Cottage, where it crosses with a skew-arch a second stream, and then crosses the Whitadder by a freestone bridge of three 40ft. spans. Passing through Ellemhaugh the new road diverges from the line of the old road (which crossed the hill at a very steep gradient), and follows the valley of the Whitadder, through Ellemford, Ellemside, Fellcleugh, and Smiddyhill. At Smiddyhill the road again crosses the Whitadder by a bridge of blue whinstone of two 30ft. spans, and joins the old road near to Cranshaws. The length of the new road is about three miles, and about three-fourths is level. Mr. W. Tait, C.E., Earlston, was engineer, and Mr. D. N. Shaw, Perth, contractor. The cost has been between £5,000 and £6,000, the land having been given free of charge.

Dewsbury and Thornhill Railway.—Major-General Marindin, C.B., Inspector of the Board of Trade, visited Dewsbury on the 1st inst. for the purpose of inspecting the new line constructed by the Great Northern Company, which forms a junction between their station at Dewsbury and the Lancashire and Yorkshire system at Thornhill. The works include a bridge over the river Calder 240ft. in width, one over the canal 88ft. in width, several smaller bridges, and a masonry viaduct. The contractors were Messrs. Brier, Son, and Wilson, of Dewsbury. Major Marindin also visited Batley, and inspected part of the works in connection with the proposed Beeston to Batley extension of the Great Northern Railway. This line, when finished, will form a branch from Huddersfield, Dewsbury, Batley, and district to Leeds, affording an alternative route of about the same length as the existing London and North-Western line from Batley. Part of the work has been finished by the contractors of the Dewsbury and Thornhill branch, and they have just entered into a new contract of £100,000 for the completion of the line. The engineers of both railways are Messrs. John Fraser and Sons, MM.Inst.C.E., Leeds and London, the resident engineer being Mr. W. H. Smith, A.M.Inst.C.E.

Railway Extension in the Hundred of Wirral.—The chairman, directors, and officials of the Mersey and Wirral Railway Companies made a joint inspection last week of the new extensions towards the north of Wirral, North-west Cheshire, which are to be opened at the close of the year. The new line, from the joint station at Birkenhead Park to the Hoylake branch, has been constructed under most unusual difficulties. Fine silt or quicksand was found to underlie the bed of boulder clay of the neighbourhood, and in this treacherous substance the tunnel has had to be constructed in very short sections, commenced at many points. The whole tunnel is now arched in. The engineers and contractors are those who built the river tunnel—namely: engineers, Sir James Brunlees and Sir Douglas Fox; and contractors, Messrs. Waddell and Son, of Edinburgh, under the local management of Mr. Prentice and Mr. D. Davidson, their engineer. The Wirral line has been constructed by Messrs. Meakin and Dean; the local resident engineer, under the directions of Sir Douglas Fox, being Mr. R. A. Freeberne. A branch line has been made across Bidston Marsh, with stations at Wallasey and Warren Park, and through communication is established between James-street, Liverpool, and West Kirby.

Major Tulloch, the inspector of the Local Government Board, held an inquiry at the Local Board offices, Harborne, on Friday, with reference to an application for sanction to borrow money for street improvements and sewerage works. Evidence in support of the application having been given by the surveyor, Mr. J. C. Dixon, the inspector viewed the sites of the proposed works, and remarked that he was satisfied with regard to the necessity of the proposed works. There was no opposition to the application.

Building Intelligence.

Cork.—A bacon-curing factory at Cork has been rebuilt from the designs, and under the superintendence, of Mr. Robert Walker, M S.A., architect, of 17, South Mall, Cork—Mr. S. Hill, Cork, being the builder, and Mr. T. A. Walsh, clerk of the works—for Messrs. Lunham Bros. It is designed so as to secure the most convenient arrangement of plan, with a view to carrying on the different processes of manufacture in their proper consecutive order. The different appliances are of the most approved type, put up under the guidance of Mr. Walker, who has made a special study of these factories, both as to buildings and appliances. A similar factory has been carried out by the same architect at Hamburg, for Messrs. Thompson and Co., Bartelsstrasse St. Pauli. The buildings cover one and a half acres.—A Capuchin convent and chapel at Charlotte Quay, Cork, have been built from the designs, and under the superintendence, of Mr. Robert Walker, M.S.A., architect, Cork. The walls are limestone, with a few red brick bands, and square limestone mullions to the two-light windows. The rules of the Order rigidly excluded features of an ornamental character. The buildings are grouped round a central open court, and are approached by a corridor and verandah running all round the court. They comprise: Chapel of the third order, reception rooms, vestibule, hall, library, refectory, kitchen, scullery, hospital, lavatories, &c. The oratory and single bedrooms are on the upper floors, approached by corridors surrounding the central court, as on the ground floor. The buildings adjoin Father Matthew's Chapel, to which it is attached. Mr. John Delany, of Cork, was the builder.

Edinburgh.—At the last sitting of the Edinburgh Dean of Guild Court, Sir James Gowans presiding, a final warrant was granted to the Association for Improving the Dwellings of the Poor to proceed with the erection of houses in West Port as dwellings for the poorer classes. Since the foundation-stone of the tenement was formally laid some little time ago, the plans have been altered and extended, the result being that the number of houses to be built will be increased from 26 to 40, while the promoters will provide a plunge bath on every flat, and a couple of washing-houses. Building operations are to be commenced forthwith, and it is expected that the property will be ready for occupation by May next year. Warrant was granted to the representatives of a philanthropic society in the city, having somewhat similar objects to the Association, to execute alterations and improvements on property in White Horse Close, Canongate. The society in question have acquired a range of old and dilapidated buildings in White Horse Close—some of the property being said to be 300 years old—with the view of so altering them as to make them thoroughly habitable and suited to the requirements of the poorer classes. The property was partly condemned by the Public Health Committee of the Town Council. By the alterations proposed to be carried out from 30 to 40 houses will be provided, as well as several shops, the latter having a frontage to Canongate. The alterations and improvements alone will cost about £1,000. The same society have also on hand the improvement and alteration of three blocks of houses in Brown's Close, Canongate, to accommodate some thirty families.

Fountainbridge, N.B.—Important alterations have just been completed in Fountainbridge Free Church, Edinburgh, at a total cost of £850. The front entrance has been extended towards the main thoroughfare. The old seats have been removed, and the church reseated throughout in pitch pine. A new pulpit has been constructed of the same material, and above it, in the north end of the building, a circular window, filled with ornamental glass, has been introduced. Six additional windows have been inserted in the roof, and the walls painted in light colours. The heating apparatus has likewise been entirely renewed. In addition, the vacant space on the west side of the church has been filled up by the erection of a hall and a couple of small class-rooms to be used for school purposes, evangelistic meetings, and other congregational work. The buildings are a memorial to the late Rev. Dr. Chalmers (1780-1847), and cost between £500 and £600. Accommodation is provided for 300 in the hall, which measures 41ft. by 28ft., and is lighted from the roof. Three coloured-glass windows have been placed in the north end of the hall, the centre one bearing an inscription. The church as altered was formally opened on Thursday, the 6th inst., and the new hall was opened the following day. Mr. R. R. Raeburn was the architect. Messrs. Mekie and Whyte carried out the mason work on the church, and Mr. N. Grieve the joiner work. The hall was built by Messrs. Cowie and M'Leod, and the joiner and other work was performed by Mr. William Galloway.

Glasgow University.—On Friday last the top stone was laid on the completion of the tower of the University buildings by a new spire. The original architect, the late Sir Gilbert Scott, designed a spire to be added to the central tower actually built, but want of funds prevented the authorities from carrying out his plan. The new open stonework spire which has just been added was designed by Sir Gilbert's son and successor, Mr. J. Oldrid Scott, of Spring-gardens, S.W. The height of the addition is 101ft. Standing on an eminence the tower and spire, which together rise about 280ft., are visible from all parts of the surrounding country, and will be the most prominent object in views of the city from a distance. The four corner pillars of the tower are continued by four stone turrets, each 40ft. in height. Two-thirds of the way up the spire is surrounded by a projecting gallery, approached by an inside staircase. This gallery and the ornamental open stonework of the spire give the completed tower a special character. The funds have been provided mainly from a recent legacy of £5,000 by Mr. Andrew Cunninghame, late deputy town clerk of the city. The contractor engaged on the spire as well as in the whole of the original University buildings, and of the Bute and Randolph Halls, is Mr. John Thompson, of Peterborough. The University Union Building is also all but completed from Mr. J. O. Scott's designs; it has cost £5,000. A portion of the front of the old College of Glasgow has also been recently rebuilt at the entrance to the University grounds through the liberality of Sir William Pearce, M.P.

Manchester Consistory Court.—At the last sitting of this Court a faculty was granted for taking down the present east end of Holy Trinity Church, South Shore, Blackpool, including the transepts, a portion of the nave and chancel, for the purpose of extension; the cost of the alteration was £4,800, and the seating accommodation would be increased by 300 seats. Faculties were also granted for pulling down the old parish church at Longton, and removing the fittings to the new one, and for adding a chancel to Holy Trinity, Littleborough, at an estimated cost of £1,600, and for rebuilding the tower of St. Michael's, Flixton.

Oxford.—During the year just closed with the Long Vacation the builder has been busy at Oxford, and is still at work both in the city and the suburbs. The extension of Brasenose College which is now in progress from Mr. T. G. Jackson's designs, is a most important work, since upon its architectural character depends to some extent the whole aspect of the High-street. The extension has necessitated the demolition of a row of shops. At Trinity Mr. T. G. Jackson has nearly completed the President's new house (illustrated in our issue of 1st July last), and the front quadrangle has now been completed. A new lodging has been built for the President at Magdalen in harmony with the Founder's Tower and the new St. Swithin's Quod. At Queen's the ravages of the late fire have been made good, and all the division walls are now carried 1½ft. above the roof so as to divide the staircases in case of a recurrence of fire. A new tutors' residence is in progress at University from Mr. Johnson's designs; and Exeter has during the vacation been redrained. Extensive new buildings are also being carried out at Hertford College, on the Catherine-street front, by Mr. Jackson. The unsightly blank wall at the east end of the new schools is now covered by a new block for unattached students, and an old building which obstructed the view of the east front has been removed. The erection of Mansfield College on the old Penton cricket ground is advancing fast, from plans by Mr. Basil Champneys. At Somerville Hall, for lady students, designed by Mr. H. Wilkinson Moore, and illustrated by us on the 9th ult., the first block has been built by Messrs. Symon and Co., of Oxford. The University Museum is being extended. Besides these University buildings, much is going on in the way of extending the city. In the north, one or two new roads are in course of construction, and many of the residents are building for themselves new houses. The increasing population has necessitated an extension of the gas works, to which a new gasometer and plant have been added at a cost of £20,000. The water company have now completed the laying of a 24in. new main from the river above King's Weir to their works, by which a new supply of 2,000,000 gallons a day is available. The cost of this work is estimated at £12,000. New parochial buildings for St. Clement's, illustrated by us on May 27 of the present year, have been erected from Mr. H. Wilkinson Moore's designs.

Pillgwenlly, Mon. — The new Roman Catholic Church of St. Michael, at Pillgwenlly, near Newport, Mon., was opened on Michaelmas Day. It is in the Gothic style of architecture. It comprises nave, aisles, sanctuary, confessional, two side chapels, and sacristy, and will accommodate 600, exclusive of the gallery. The internal dimensions are: Length, 108ft.; width, 49ft.; height to wall plate nave, 35ft.; to ridge of roof, 61ft. The base of the tower only is built yet; but it is intended to carry the tower and spire to a height of 120ft. The architect is Mr. W. Gardner, and the contractor Mr. W. N. Blackburn. The building cost £3,377, exclusive of fittings.

Pollokshields, Glasgow.—A new church erected in Pollokshields for the Stockwell Free Church congregation, was opened on Sunday last. The buildings comprise a church seating 1,000 people, church-hall seating 480, large classrooms, session house, ladies' room, vestry, &c., have been designed by Mr. John B. Wilson, A.R.I.B.A., Glasgow, his scheme having been selected by the committee from those submitted in competition. The style is a free treatment of Italian Renaissance. A tower rising to a height of 140ft. forms a conspicuous feature of the design externally. The interior of the church is free from columns; the area, 52ft. wide, being roofed over in a single span with double coved ceiling, across which the roof-couples are partly shown in ornamental construction. The contractors for the various departments of the work, mainly of Glasgow, were:—Mason, Mr. P. Shannon; wright, Mr. D. Buchanan; plumber, Mr. W. Anderson; slater, Mr. A. Sinclair; plasterer, Mr. A. Brown; glazier, Messrs. Meikle and Sons; painter, Mr. W. Stevenson; gasfitters, Mr. H. Buchan, Glasgow, and Mr. T. Main, Birmingham; heating, Messrs. Cook and Co., Edinburgh; upholstery and carpets, Messrs. T. and J. Smith; tiles and mosaics, Mr. T. Main; and wrought-iron gates and railings, Mr. George Adam, Partick. Mr. George Banks was clerk of works.

Whetstone, N.—On the 15th the memorial stone of a Congregational school-chapel was laid. The style of the building is a simple treatment of the Early Gothic. It is faced with white bricks, with Bath-stone dressings and tiled roofs. Accommodation is provided in upper floor school chapel (60ft. by 35ft.) for about 350 adults, with a vestry, tea-making room, &c. On ground floor will be an infants' class-room, a lecture-room, vestry, and five class-rooms. The contract for the main building, including lighting, heating, &c., is £2,007. The architect is Mr. George Baines, 4, Great Winchester-street, E.C., whose designs were chosen in a limited competition. The builder is Mr. R. G. Battley, 21, Old Kent-road, S.E.

The parish church of Detling, Kent, was reopened last week, after extension of the north aisle, addition of organ chamber built in the Perpendicular style, and removal of the western gallery. Messrs. Clarke and Canning, of Stratford-place, W., were the architects, and Messrs. Wood and Sons the builders.

A marble statue of the late Earl of Iddesleigh was unveiled on Wednesday in the public gardens of Northernhay, Exeter. Mr. E. J. Boehm, R.A., was the sculptor.

NATIONAL GOLD MEDAL DESIGN FOR A CATHEDRAL CHURCH.—NEW REREDOS, LONG MELFORD CHURCH, SUFFOLK.—ESHER VILLAGE HALL AND LONDON AND COUNTY BANK.—VICTORIA TEMPERANCE HOTEL, BARNSTAPLE.—"IN NORMANDY."—DRINKING-FOUNTAIN AND CLOCK TOWER, STRATFORD-ON-AVON.

OUR LITHOGRAPHIC ILLUSTRATIONS.

DESIGN FOR A CATHEDRAL CHURCH.

This design is arranged for a supposed rectangular site, the building lines being 360ft. by 265ft. The site is open all round. A rather elaborate phase of Decorated Gothic is selected, more as a study than for any preference for the style, a study of a similar nature having been previously made in Early English. The plan is arranged to bring the officiating clergy reasonably within view of the congregation, the pulpit standing under the crossing, the opening under the central tower being closed by vaulting. A choir vestry, not shown, is situate over the two clergy vestries, approached by a circular stair from the north aisle of the chancel. The organ galleries are carried up externally as a feature to give greater height for length of pipe. Arrangements are suggested for heating by hot water, accommodation being provided for boilers, gas engine, &c., under the vestries, the flue from which runs up the side of chapter house turret. The design is by Mr. F. Whitwell, York, and was awarded a National Gold Medal in 1886.

NEW REREDOS, LONG MELFORD CHURCH.

In the description of Long Melford Church given by Sir William Parker reference is made to a carved subject of the Crucifixion having formerly existed above the altar, containing many figures, horses, &c. On removing some woodwork a large recess was discovered, into which the new reredos is placed, the central panel being 7ft. in width. The design is by Mr. John Medland, of the firm of Messrs. Medland and Powell, and the work has been executed by Messrs. Farmer and Brindley.

THE ESHER VILLAGE HALL AND LONDON AND COUNTY BANK.

These premises recently erected at Esher are the result of a project originated by the late Duke of Albany, and carried out by the neighbouring residents after his death. They comprise a hall adapted for concerts and meetings, seating 430 persons, with accommodation for the local working men's club, and banking premises for the London and County Bank, with a manager's residence. The building has been constructed in local red bricks and half-timbered work, with Broseley tile roofs, at a cost of £4,200, by the contractors, Messrs. Oldridge, from designs by Mr. Wm. Harvey, F.R.I.B.A., and was opened by the Duchess of Albany in July last.

THE VICTORIA TEMPERANCE HOTEL, BARNSTAPLE.

The accompanying design, by Mr. J. King James, of Birmingham, was selected out of a large number in public competition. The front walls are of Appledore stone, and the roofs tiled; the internal walls are brick. The dining-hall will seat 150 persons; there are besides the coffee bar, commercial room, coffee and smoke rooms, private sitting-room, manager's room, and parcels room, 15 bedrooms, with ample lavatory and bathroom accommodation, and there is stable room for 80 horses. There are entrances both from High-street and Gammon's-lane, and there will eventually be an entrance also from Tuly-street.

"IN NORMANDY."

This is the title given by Mr. E. Jeaff-Jackson to the sketch which we publish from the Royal Academy Exhibition of an old French chateau stair-tower and turret. The author of the drawing is abroad, and no particulars having reached us, we are unable to give further details. It might be taken as a portion of the Bishop's Palace at Evreux.

STRATFORD-ON-AVON DRINKING-FOUNTAIN.

This structure is a gift from Mr. George W. Childs, of Philadelphia, to the town of Stratford-upon-Avon in the Jubilee year of Queen Victoria as a useful and much-needed object of utility, as a tribute to the memory of Shakespeare, and a mark and memorial of the friendly feelings now existing between Great Britain and America. The plan of the ground and second story is square, with buttresses placed diagonally at the corners. These are terminated by lions and eagles alternately, bearing the arms and symbols of the two countries. On two sides are large and massive drinking troughs for cattle, beneath which are troughs for dogs and sheep; on one side is a trough and spout for men. The whole of the plinth as high as the upper line of the troughs is, with the troughs themselves, of Peterhead granite. The remainder of the stone is from Bolton Wood, in Yorkshire, a fine-grained and extremely hard material of a delicate grey tint. It bears a remarkably fine arris, thus giving great sharpness and crispness of effect to mouldings and carvings. The carvings in the panels are emblematical of the nationalities of the United Kingdom, whilst the gargoyles, &c., represent some of the fantastic creations of Shakespeare in "Midsummer Night's Dream." The monument was inaugurated by Mr. Henry Irving on Monday last, the American Minister and other notabilities being present. Mr. Irving made a very eloquent and beautiful speech on the occasion. A luncheon given by Sir Arthur Hodgson, Mayor of Stratford, was afterwards served to 100 guests in the town hall, where speeches were made by the American Minister and others. Mr. Jethro A. Cossins, of Birmingham, is the architect, and the work has been carried out by Mr. Robert Bridgeman, of Lichfield.

A Roman Catholic school chapel in Hale-road, Walton, near Liverpool, was opened on Sunday. The new building, erected at a cost of £2,550, is in local grey brickwork, with Runcorn red stone dressings, and measures 103ft. by 17ft. The upper portion, approached by a stone staircase, will for the present be used as a chapel, and accommodates 500 persons. An altar and reredos have been erected within the sanctuary. On the ground floor are a schoolroom and three classrooms, with suites of lavatories and cloak-rooms arranged on one side. The accommodation provides for 470 children. The building is surmounted by a belfry. Messrs. Sinnott, of Liverpool, are the architects, and Mr. Foggarty the contractor.

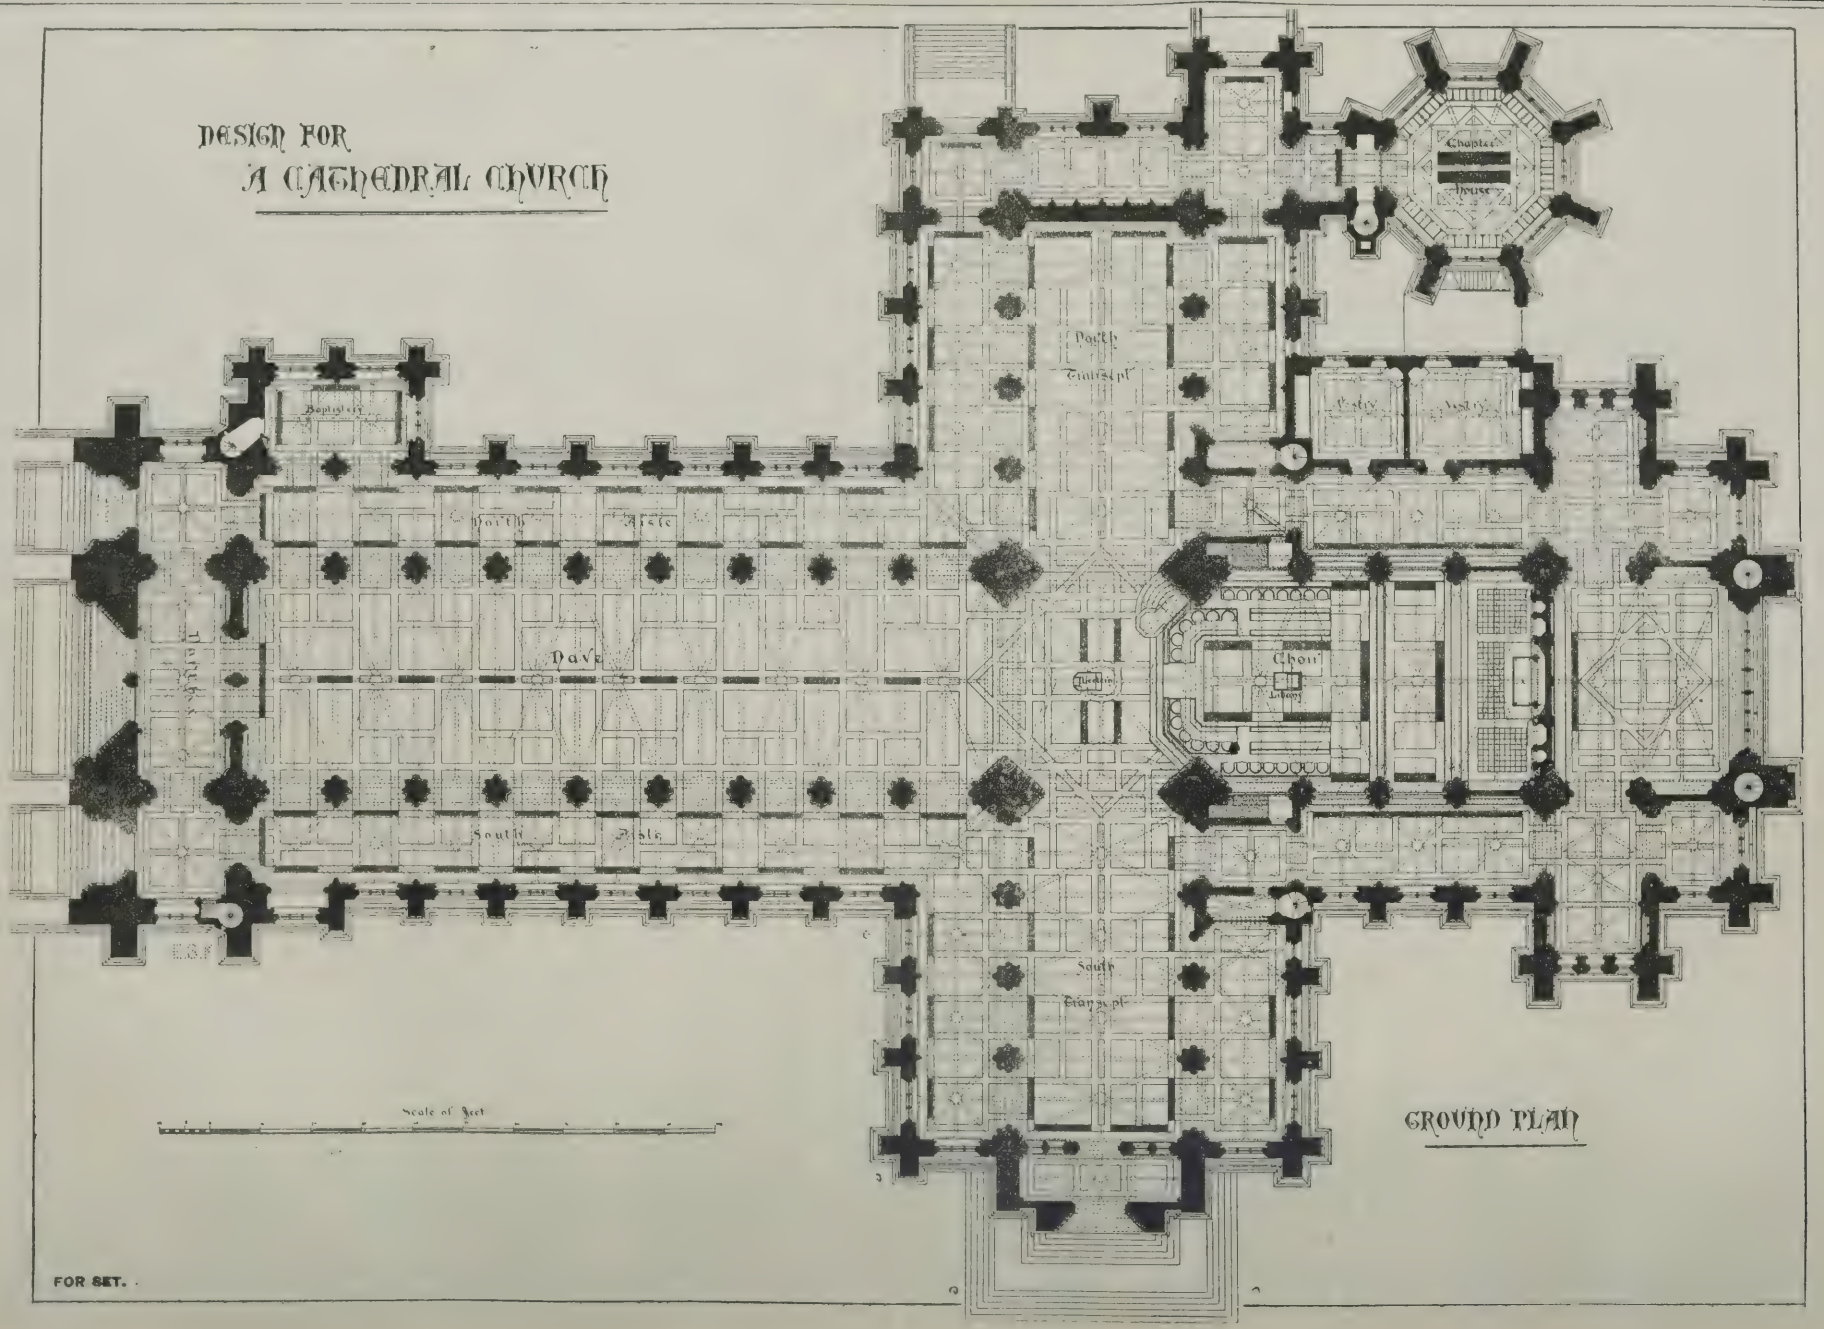
The death is announced, at the age of four score years, of Herr Frederick Theodore Von Vischer, the distinguished German art critic. In 1844 he published his celebrated "Excursions in Criticism," which caused him to be suspended from his post of professor of art at Tubingen University, to which he was restored eleven years later. In 1857 his work on "The Sublime and the Humorous" was issued, and was followed by "Æstheticism the Science of the Beautiful," his most important production, and in which the history and development of æsthetic speculation from Kant to Hegel was traced.

The Congregational church in Carter-street, Uttoxeter, was reopened last week, after reseating in pitch pine and other improvements, carried out at a cost of £600. Mr. Isaac Wood, of Uttoxeter, was the builder. A new organ has also been placed in the church, built by Messrs. Nicholson and Lord, of Walsall, at a cost of £300.

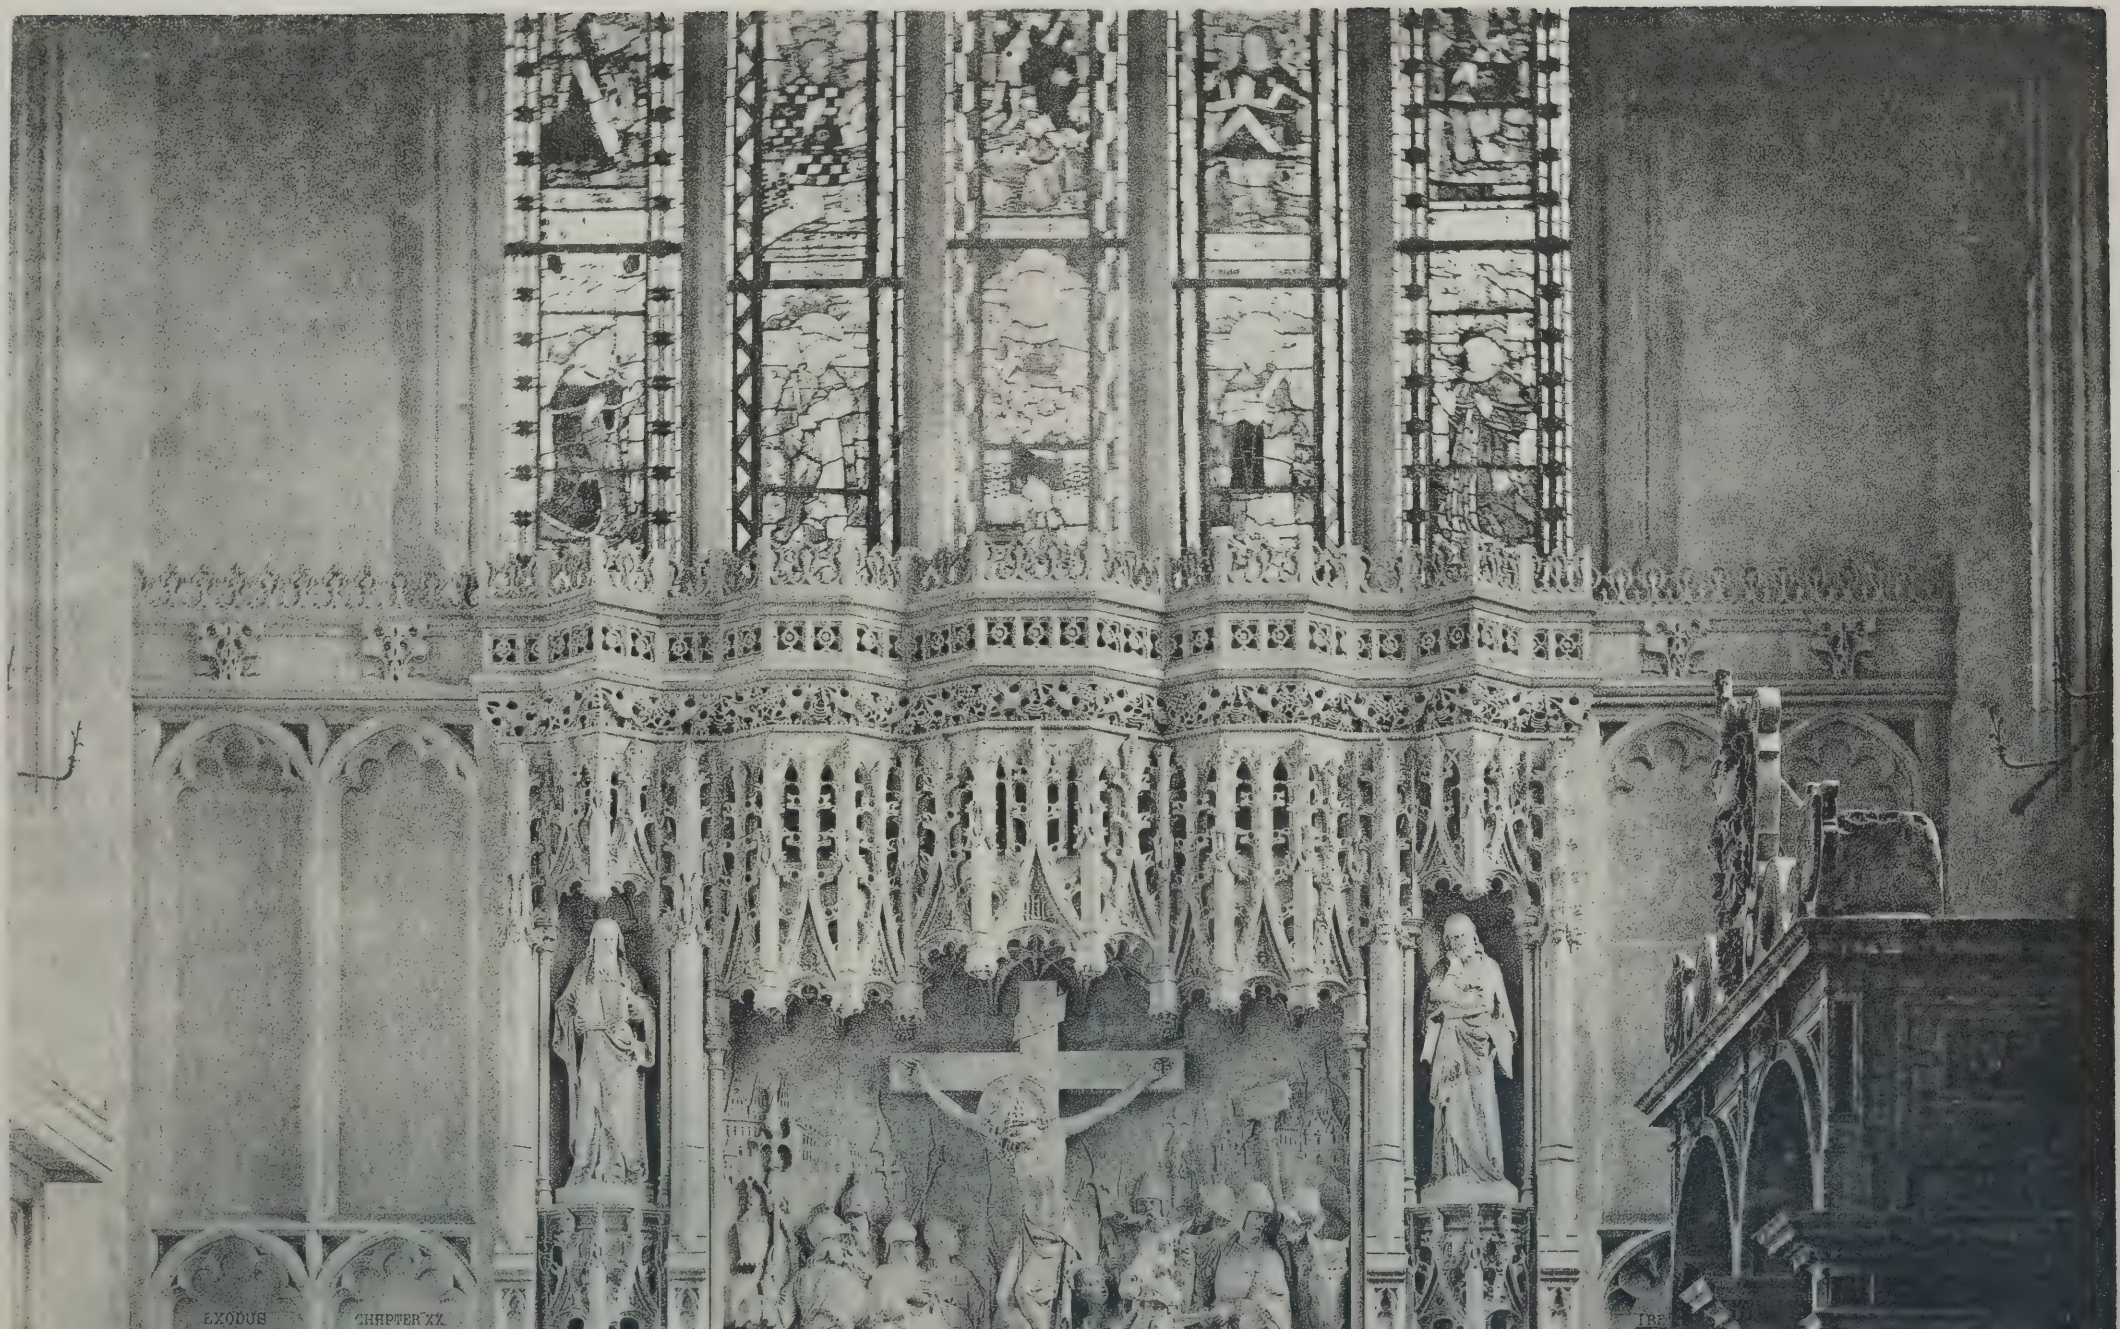
FURNESS ABBEY: THE CHAPTER HOUSE.

The Chapter House is about 56ft. long by 42ft. broad. On the east side of the cloisters are three large Norman archways—the centre one leading into the vestibule of the Chapter House, and the others into cells—equal in size to the vestibule, which is about 12ft. square. The vaulted roof of the Chapter House has been supported by six clustered shafts, the capitals of which have been plain and foliated alternately. The room was lighted by 12 lofty windows; on the north side by two, which face the sacristy windows; and on the south side by four—the remaining six windows were placed on the east side, all being arranged in pairs. A raised platform or dais was carried round three sides of the room, reached by steps. The date of this part of the abbey is from 1120 to 1130. Over the Chapter House, which adjoins the south transept of the church, was the scriptorium or library, and south of the Chapter House are the remains of the once-busy fratry or day-room. The whole interior has been gorgeously painted and gilded. Our illustration of the north side of the Chapter House is from a drawing by J. Fredk. Wilkinson, of Kendal.

COMPETITIONS.



Leeds.—The population in the vicinity of Roundhay-road having increased with great rapidity of late year, it has been felt desirable to provide additional church accommodation for the district. With this object in view, it has been decided to form a new district by amalgamating portions of the areas attached to three other districts. A local committee has been organised, and is proceeding with the steps to be taken for the erection of the requisite buildings. A plot of land, extending from Harehills-road to Roundhay-road, has been given by Earl Cowper, upon which it is intended to erect a church, schools, and vicarage. Competitive plans were invited from several local architects, those submitted by Messrs. Chorley and Connon being unanimously accepted by the committee. The erection of the schools is to be proceeded with at once. These are to be used for service until funds have been raised for the completion of the entire project.



Paisley.—From about twenty plans sent in in competition for the proposed new county and police buildings for Renfrewshire, the Police Committee of the Commissioners of Supply have approved of the plans submitted by Mr. George Bell, architect, St. Vincent-street, Glasgow. The new county buildings are to be erected to the east side of the Sheriff Court-house in St. James-street, Paisley. The accommodation to be provided in the new buildings will include a county hall, apartments for the Commissioners of Supply and the Clerk of Supply, rooms for the County Road Board and the County Road Trustees, a Court hall for the Justices of the Peace, a county police office and cells, with dwelling-houses for Renfrewshire police officials.

South Shields.—In a competition limited to the architects of South Shields, the Burial Board of that town have selected the following designs submitted for their proposed new cemetery chapels and superintendent's house:—1. "Respice Finem," by Henry Grieves, A.R.I.B.A.; 2. "Accipe Homo," by Messrs. Stout and Dockwray. Six designs were sent in. The Board have given instructions to the author of the first to carry out the works, and have awarded a premium of 10 guineas to the authors of the second design.

Copies of four of Mr. Watts's pictures have been hung in the Church of St. Jude's, Whitechapel. They have been made under Mr. Watts's personal superintendence, and they had their finish from the master's own hands. The subjects of the pictures are "Love and Death," "The Messenger of Death," "Death Crowning Innocence," and "The Good Samaritan."

The east window of the chancel of St. Andrew's parish church, Moreton-on-Lugg, Herefordshire, has been filled with stained glass by Dr. Salviati and Co., of London and Venice, who have also decorated the ceiling of the chancel in blue and gold, and executed mosaic decoration on the side walls.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Birmingham Architectural Association.—The following is the programme of this Association for the ensuing session :—

Nov. 4th.—Annual Conversazione and Architectural Exhibition at the Assembly Rooms, Edgbaston.
Nov. 15th.—Paper by Mr. J. W. Bradley, B.A., "A Gossip about Old MSS."
Nov. 27th.—Paper by Mr. A. Reading, A.R.I.B.A., "German Romanesque" (illustrated).
Dec. 13th.—Paper by Mr. W. Wallis, F.R.G.S., "The Temples, Forum, Theatres, and Tombs of Pompeii" (illustrated).
Jan. 3rd.—Paper by Mr. W. H. Bidlake, M.A., "Optical Refinements in Architecture."
Jan. 17th.—Paper by Mr. W. Henman, A.R.I.B.A. (subject undecided).
Feb. 14th.—Paper by Mr. W. Wallis, F.R.G.S., "Pompeian Art," Lecture No. II.
Feb. 28.—Paper by Mr. J. W. Tonks, "Gold and Silver Keys."
March 13th.—Paper by Mr. W. Doubleday, "Mr. John Ruskin and the Stones of Venice."
April 3rd,—Paper by Mr. H. Lloyd, "Notes in Norfolk."
April 17th.—Paper by Mr. S. T. Holliday, "An Architectural Tour on the Mediterranean."

Manchester Architectural Association.—The thirteenth session of this Association was opened on Tuesday evening by a conversazione held at the Athenæum. The President, Mr. A. H. Davies-Colley, A.R.I B.A., received the guests, and afterwards delivered a short address. A number of architectural drawings and models, specimens of decorative art, furniture, and building materials were exhibited, and selections of vocal and instrumental music were given at intervals during the evening. The annual report of the Association, after referring to the services of the retiring president, Mr. Lawrence Booth, who has occupied the chair during the past two years, states that there has been an increase in members during the last twelve months, the total membership now being 11 honorary and 54 ordinary members. During last session papers were read by Messrs. L. Booth, W. Parslow, A. H. Davies-Colley, W. H. Littlewood, J. E. Pythian, H. E. Stelfox, W. H. Rawle, and J. B. Gass. In reference to the question of federation, the report observes :—"The Royal Institute of British Architects, in instituting the examination in architecture by formulating the draft charter and by reforms in its procedure, is placing itself more in touch with the great body of architects in the country than was ever the case before. Much, doubtless, remains to be done to make the Institute thoroughly representative ; but, while differences of opinion exist, the preponderance of opinion among our members is certainly in favour of working as much as possible in conjunction with the R.I.B.A." The awards in the Association classes are as follows :—Class of Design : 1st prize, Ernest Farrar (with Mr. J. Lowe) ; 2nd prize, A. S. Chadwick (with Mr. J. Horsfall). Class of Construction : 1st prize, A. S. Chadwick ; 2nd prize, Rd. Booth (with Mr. Lawrence Booth). The balance-sheet shows a total income of about £54, and the balance in hand is larger than last year, being nearly eleven guineas. The following is the syllabus for the ensuing session :—

Nov. 1, 1887.—President's Address.
Nov. 15.—Paper by Mr. J. Corbett. Subject, "House Water Fittings."
Nov. 29.—Reserve.
Dec. 13.—Paper by the Rev. R. H. Snape (Bolton). Subject, "Scottish Cathedrals."
Jan. 10, 1888.—Paper by Mr. C. Heathcote.
Jan. 24.—Paper by Mr. G. E. Statham (Nottingham). Subject, "Notes on Building Stones."
Feb. 7.—Paper by Mr. Edgar Atkins. Subject, "The Law in Relation to Architects."
Feb. 21.—Paper by Mr. W. C. Tuke. Nomination of Officers.
March 6.—Election of Officers.

Sheffield Society of Architects and Surveyors.—The list of members and rules of this newly-established society has just been issued, from which we learn that it commences its first session with forty-eight fellows (all of whom have been in practice as architects or surveyors as principals for not less than five years), twenty-two associates, and four students. Mr. T. J. Flockton is the president, Mr. F. Fowler vice-president ; Mr. J. B. Mitchell Withers treasurer, and Mr. W. C. Fenton, of Bower Spring, hon. sec., with four fellows and an associate as ordinary members of council. The objects of the society are defined in the rules as :—(*a*) The advancement of the profession of an architect and surveyor ; (*b*) for promoting and facilitating the acquisition of a knowledge of the various arts and sciences connected therewith, and the education of the junior members thereof ; (*c*) the consideration of questions of professional practice.

ARCHÆOLOGICAL.

Tockington.—The members of the West Gloucestershire section of the Bristol and Gloucestershire Archæological Society paid a visit on Friday to Tockington for the purpose of inspecting the remains of a Roman villa rediscovered three years since close to a farmhouse. Sir John Maclean, F.S.A., described the remains, which were originally partly uncovered in 1787, and again lost sight of. The remains appeared to be those of the foundations and tesselated pavements of a Roman villa, apparently of early date. Prebendary Smith agreed that the pavements were very good and of early date, probably of the time of Agricola, adding that this was the 27th Roman villa opened up in this country. He trusted that the excavations would be continued.

CHIPS.

A new thoroughfare in Poplar, 40ft. wide and 250ft. in length, was opened on Tuesday week. It has been made at a cost of £15,000, borne jointly by the Metropolitan Board of Works and the Poplar district board, and provides a new and shorter route between the City and the Isle of Dogs.

A new Free Presbyterian church and manse on the island of Bernera, Harris, have now been completed, and the church will be opened by the Rev. Dr. Rainy, of Edinburgh. The architect was Mr. Binnie, of Glasgow, and the contractor Mr. W. Bain, Benbecula.

The late Mr. Richard Berridge, a partner in the brewing firm of Meux and Co., has left the sum of £200,000 in trust for the advancement and propagation of education in economic and sanitary science in Great Britain.

A harbour is in course of construction at Portnochie, N.B., and will be completed in another year. Messrs. D. and T. Stevenson, of Edinburgh, are the engineers, and Messrs. Morrison and Son, of the same city, the contractors. The cost will be about £10,000.

The premises of Mr. J. Greenfield, in High-street, Belfast, occupying the site of two 18th-century houses, have just been rebuilt from plans by Mr. James J. Phillips, Antrim-street, Belfast ; Messrs. John Lowry and Son were the contractors.

Mr. Alfred E. Hewitt, at one time master of a branch of the Birmingham School of Art, has been appointed principal of the Guernsey School of Science and Art, which was declared open last week by Lieutenant-General Elkington, C.B., Lieutenant-Governor of the island.

The Free Libraries Act was adopted at Welshpool on Saturday. The nucleus of a library is provided for by the presentation to the town of the Powysland Museum and Library, valued at £6,000.

A stained-glass window of three lights has just been inserted in the north aisle of Buckland Filleigh Church, Devon, in memory of Mr. W. B. Browne, 16th Lancers, who died in the Soudan Campaign. The subject is "Moses striking the rock." The artists were Messrs. Savile and Young, and the architects, Messrs. Hooper Bros., Hatherleigh.

A new chapel for the Wesleyans of South Bank district, York, was opened on Thursday, the 13th inst. Designed by Mr. Charles Bell, of London, it has cost, including site, £6,000, and seats 650 persons.

Mr. Webster, the borough surveyor of Malton, who has for some weeks been suffering from typhoid fever, is now convalescent, though still confined to his room.

Owners of first-class pictures by deceased British artists, commencing with Hogarth, up to date, who are willing to lend them to Sir Coutts Lindsay, are requested to address him at the Grosvenor Gallery, London, where it is proposed to inaugurate the New Year with a loan collection of oil paintings, which will be limited to 100.

There has just been placed in the parish church of Runcorn a mural tablet to the memory of the late Canon Barclay, vicar of Runcorn. The tablet, which is made of white marble and alabaster, is from the establishment of Messrs. Williams and Clay, of Warrington. In the centre is a profile of the late vicar, flanked on the right side by a figure representing Industry, and on the left a figure representing Eloquence.

The tower of March parish church is about to be refaced, strengthened, and partly rebuilt, from plans by Mr. Bassett Smith.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom ; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings ; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

Received.—H. and S.—E. and H. L.—T. R. C.—R. S. N. and Co.—S. Bros. and Co.—W. C. and Son.—J. A. and Sons.—J. E. and Son.—J. G. A.—J. W. and Co.—C. E. and Co.—G. E. and Co.—G. and T. E.—A. B. and Co.

Correspondence.

A PROVIDENT FUND FOR ARCHITECTS ASSISTANTS.

To the Editor of the Building News.

Sir,—It was with pleasure I noticed in your last week's issue of the 14th inst. a suggestion for the formation of a fund for architects' assistants. This, to my mind, is a most desirable thing, and would tend to that unity wherein alone is strength, and doubtless would be beneficial in building up those constitutions that otherwise by the force of circumstances must succumb.—I am, &c.,

J. A. Piccaver.

165, Upland-road, East Dulwich, S.E.
Oct. 18th.

Sir,—The suggestion made in your last issue for starting a provident fund to help assistants during illness appears to be a very good one, provided only that care be taken in the distribution of the fund, that it may not be used to keep the idle when out of work at the expense of their more fortunate or more industrious brethren. So long as the fund is limited to providing medical aid to assistants who are in want of it, with, as it grows, beds constantly kept ready for use in one or other of the pay hospitals, and possibly a cottage by the sea, to eventually become a convalescent home, nothing but good can come of the movement, and I am sure most assistants would subscribe to the fund. Those who are now earning money would know that they were providing for themselves against a rainy day, whilst in

the mean time their money was being used for a good purpose. I would suggest that the secretary of one of the professional societies should act as secretary to this fund, the president being permanent patron, whilst the fund should be entirely under the control of a committee of assistants, formed for the purpose under the Friendly Societies' Acts.—I am, &c.,

HOPEFUL.

ST. OUEN, ROUEN.

SIR,—The author of "Wayside Notes" is, I think, in error when writing of the west front of St. Ouen, Rouen, as a "dreadfully hard piece of *restoration*." The west front of St. Ouen was never completed, and the portal and two towers which now form the front were built in 1846-52, unfortunately not carrying out the original design, which still exists in the library. Otherwise, I quite agree with your correspondent that nothing will be more terrible than French restoration.—I am, &c.,

R. PHENE SPIERS.

[Mr. Phené Spiers' correction, for which I am obliged, hardly affects my argument. It will be remembered I said that—"French restorers, like new brooms, *generally sweep clean*." Surely there was a pretty clean sweep at St. Ouen when the diagonally-set tower-stumps (which, I believe, had been carried up in the Middle Ages to an elevation of 50ft.) were pulled down to make way for the present overgrown *flèches* of despicable outline and ignoble proportions. Ruthlessly to pull down the commencement of an old west front to a noble church is a piece of very hard restoration indeed. For the hardest restoration would appear to me to be that which is most unlike, and most careless and destructive of the work of the old builders. Still, my apologies are due to any youthful readers who I may have led into believing that the west front of St. Ouen is a literal restoration of an old piece of design and workmanship.—GOTH.]

FOREMEN OF MASONS.

SIR,—I have read with interest the letter from a "Banker Hand" which appeared in your issue of the 23rd of September, and am constrained to ask permission to make a few passing remarks thereon.

Your correspondent states truly that foremen masons are occasionally sought after by means of advertisements in the papers. I will just pause to say that the same will apply to foremen in all the other branches of the building trade, and unquestionably for the same reason.

To proceed, "Banker Hand" not unreasonably asks, Could not the appointment be made from the ranks of the staff of workmen in the shop where the vacancy is to be filled up? and further inquires, If it is just to those men that a sranger should be brought into their midst?

So far so good. But "Banker Hand" ought to know that justice or sentiment has no place in the calculations on either side. What appears to his rather obscure vision as an act of injustice is undoubtedly to the other side a matter simply of expediency.

Time was, though probably not within the experience or recollection of "Banker Hand," when a master in any particular branch was a master in fact as well as in name; that is to say, he was a master of the craft, and presumably he might himself have risen from the ranks, and it became at once his pride and glory to move about amongst his men, and not unfrequently took a place beside them at the banker or the bench, as the case might be; between them and him there was a perfect understanding and a reciprocity of interests. He would know, as no one else could know, their individual capabilities and character, and would place his confidence and fix their rate of wages accordingly as each one distinguished himself, thereby infusing amongst them, from the highest to the lowest, an active and laudable spirit of emulation with the most satisfactory results all round. Under auspices such as these the master would experience no difficulty in selecting the right man for the right place, and consequently have no need to advertise; they (the men) on their part would be under no fear that a stranger would be brought into their midst to rule over them.

But time and circumstances have changed all that, and, however much it is to be regretted it is nevertheless a fact that the old race of masters who desired nothing more than to remain as such to the end of the chapter are unfortunately all clean gone—never, I fear, to return; and in their place has arisen a new line of men who act as "general contractors," who, so long as they can command capital, need not necessarily be craftsmen at all, but simply *financiers*, whose chief aim and desire is to grow rich in the shortest possible period of time, the foreman acting the part of master craftsman, on whom alone devolves the duty of supervision; in them only the employers place their confidence, which they (the foremen) are allowed to retain just so long, and no longer, than the financial results are satisfactory to their chief; and in case of the foreman seeking a new appointment, his chances of success depend upon whether or not his credentials state that his work came out a financial success. Herein lies one of the most cogent reasons why foremen are occasionally advertised for.

Then, on the other hand, in the stead of the old school of artisans, who, with good reason, prided themselves upon the mutual good understanding that in their time existed, as it ought to exist, between master and man, has grown up a class of workmen, styled *employés*, who have been taught to believe, and persistently cherish the belief, that the employers are a common enemy, who deserve to be swept out of existence altogether, forgetting the while the naked fact that as yet, up to the present time, they have discovered nothing which they could set up in their places. They, the employers, are credited with having but one anxiety in regard to their employés—that is to get as much work done per hour as they can possibly wring out of them, under the fear of discharge, with its accompanying search after another job. While they on their part entertain a fixed determination to render just so much and no more then they can, under the circumstances, possibly help. The good old healthy spirit of emulation is dead and buried, having been wilfully murdered by the blighting and undermining influences of the much-to-be-deprecated system of a uniform rate of pay; and when by chance its ghost reappears, as it occasionally does, in the shape of some more than usually intelligent and especially skilled artisan, who also, being industriously inclined, its stay is in most cases exceedingly brief, for he that being in possession of those rather exceptional qualifications, has the temerity to put them into practice in the presence of his fellows for the purpose of advancing his own individual status in the eyes of his foreman, and, through him, the esteem of his employer, with the view of some day being lifted into a position of trust and its accompanying reward in the form of a higher rate of wage, must be possessed of a larger share of moral courage than falls to the lot of the majority of workmen nowadays if he is able to withstand the pressure that is certain to be brought to bear upon him. Thus it is that individual excellence is in so many instances stifled at its birth, or, at least, stunted in growth.

There is yet another reason which doubtless influences an employer when he is induced to seek amongst strangers for the purpose of filling up a vacancy in his staff of foremen—namely, such a one in his estimation would possess superior advantages over one selected from amongst those over whom he will be appointed to rule, in the fact that he would at least be a free agent, and thereby armed with an independency of action.

I believe these facts—for facts they unmistakably are—will sufficiently explain away the apparent mystery which caused "Banker Hand" to propound his question.—I am, &c.,

J. WOODLEY.

ST. ALBAN'S ABBEY.

SIR,—The following appears in a recent issue of the *Herts Advertiser and St. Alban's Times*:—

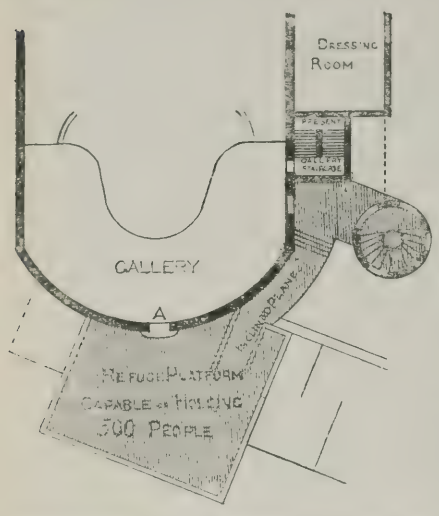
"We understand that a large tank is being placed in the bell-chamber of the tower, the weight of which when full will be about ten tons. We pointed out a few weeks ago that cracks were showing themselves on the eastern arch of the tower, and yet fresh weight is being added! It may be that there is no danger; but it would be satisfactory to the large congregations which attend the Abbey every Sunday if some assurance were given by a competent authority that there is no likelihood of the tower giving way under the strain. Now that the hoarding which has for some time hidden the south transept is being removed, the interior presents itself in all the ugliness of a Grimthorpean restoration. The old ceiling has disappeared and a plain *pitch pine!* one has taken its place, while the five tall lancet lights of the new south window, all of exactly the same height, and rising to an equal level at the top, would not do credit to a Salvation barracks. The old south window, whether a genuine Perpendicular one or only a modern imitation, was certainly far preferable to the present monstrosity. The old features of our ancient Abbey, hallowed by the associations of bygone days, are fast disappearing."

The fine old panelled roof of English oak that has been taken off to make way for Lord Grimthorpe's abortion in pitch pine, was commonly reputed to have been decorated with its quaint painting in Abbot Wheathampsted's time. (John of Wheathampsted was the 33rd Abbot of St. Alban's, one John Bostock by name, and ordained A.D. 1382.) What *will* be "done" next?—I am, &c.,

NON-BECKETT.

ESCAPE FROM FIRES AND PANICS IN THEATRES.

SIR,—Agreeably with the suggestion in your "Wayside Notes," I send you particulars of the means about to be adopted in the Nottingham Theatre Royal for improving the exit from the gallery, which at present is no better than that which was provided for the Exeter Theatre.



In respect to this part of the building, I am of opinion that it represents all that is necessary as a provision for the safety of the occupants—at any rate, I think it would be found to be more adequate than is contained in one of the recommendations of your contemporary, the *Builder*—namely, that an audience should learn to acquire that degree of self-control as would enable them "*to take military order*, and walk downstairs in step, three abreast, or as many as the width of the stairs allow."

In the instinctive eagerness to gain the outlet on the dire occasion of a panic, my own experience tells me that the possessor of the coolest head will not scruple to trample over the body of his most respected neighbour, and, assuming the audience always to remain the same, I question whether any amount of discipline and drill would qualify them to behave in the orderly manner above named.

[The roof over the portico and rooms behind the same will be converted into a platform, protected by iron railings, and made level with the gallery, from which wide fire-proof doors will open outwards on the platform, and this will be large enough to contain the whole of the gallery occupants. From this point an open balcony will communicate with an outer staircase, free from sharp turnings, and leading to the ground. In case of fire the audience would naturally make for the more immediate opening leading on to this platform, and, finding themselves in the open air and separated from the building by a brick wall, would feel such a sense of security as would enable them to descend from this temporary haven of refuge in a quiet and orderly manner; but so long as a single internal staircase is the only means of exit, as at Exeter, the same direful consequences would inevitably ensue. Should any additional exit from the upper circle be needed, a doorway and outer wide landing might connect this corridor with the proposed new staircase. Wherever an outer balcony and exit therefrom are practicable as a means of escape from the galleries of our other public buildings, it is hoped that the proprietors will at once see the necessity of making such provision against fire and panic, and thus prevent a recurrence of those terrible calamities of which there have lately been so many. In the plan, "A" indicates the position of the new exit from the gallery on to the refuge platform. This is by means of spring doors opening outwards on to the refuge platform, which is level with the uppermost of the stepped seats of the gallery, thus, as an exit, avoiding the precipitant rush which would otherwise be made on to the occupants below.

The egress from this platform will be by a

wide balcony on the outside of the building along an inclined plane of one in six, at the foot of which will be another exit from the

lower corridor of the gallery on to a large landing, and at the extremity thereof a circular staircase, consisting of four flights of broad steps, separated by spacious landings, will lead to a yard communicating with the street.]
—I am, &c.,

Thomas C. Hine.

Victoria-street, Nottingham, Oct. 8, 1887.

GANGWAYS v. STAIRCASES.

Sir,—Since the fire at Exeter Theatre, the question of exits and entrances has been prominently before the public, and the question of the best form of staircase discussed. I may state that in connection with public buildings stairs are a mistake, and I would in their place recommend a staircase in the form of a gangway. The reason I have for advocating the gangway is the ease with which you can ascend or descend. In public works, especially dye-works, they will not use the stair, but gain access to the several floors by gangways with a rise of about 5ft. in 12ft. or 13ft. of length, and any one watching the speed and ease with which the workers run from floor to floor would at once understand why staircases are not used. Of course, architecturally, they have not the dignity of the staircase; but, in theatres and music-halls, dignity is secondary to security. The advantage of the gangway is easily explained. In going down a stair, each step, or, in a hurry, each second step, must be taken, and the slightest mistake throws the person down. In a stair 12ft. long, at least six different steps require to be taken: in a gangway of the same length, a person in a hurry, or in the excitement of a panic, would take it in two bounds, and with perfect safety. I would like if you would publish this, that the opinion of your readers might be taken.—I am, &c.,

A. Lindsay Miller.

DRAIN TRAPS.

Sir,—I observed in your issue of last week, on p. 601, a letter from Mr. Wm. Brown, architect, York, referring to illustrations and description of traps on p. 565. Since reading Mr. Brown's letter, I have again carefully measured one of the traps referred to in my former letter, and I now beg to confirm the description on p. 565, and beg leave to correct Mr. Brown's figures, and when put in his style of description would read: "The opening at the bottom of the 6in. trap, taken vertically, is 2½in., and the dip or water seal 3⅜in." The oblong inspection openings are made about 1ft. 3in. long, on the 6in. traps. The proprietor states that it was upwards of eighteen years since the house was built, and no alterations were made on the drains till this year. Surely, Mr. Brown can find a difference between the trap shown and described on p. 565, and the patent trap he described in his letter.—I am, &c.,

Oct. 17th. Clerk of Works.

THE WEST OF SCOTLAND SANITARY ASSOCIATION ON HOUSE DRAINAGE.

Sir,—After many years' practical experience, full and careful consideration of every detail, and application of every possible test known to me, I beg to confirm Mr. Buchan's statement, and maintain that the principle of trapping and ventilation of drains described as executed by him at "Hulmhurst," Glasgow, is much better, and a better protection to the inmates of the house than the faulty principle described as "desirable improvements" by the Sanitary Association, and I cannot concur with "Engineer" when reported to have said that the soil-pipe was the natural ventilator for the drain, or, rather, the tail-drain.

The traps at the foot of soil and waste pipes should be placed a few feet from the vertical pipe, so that the force, or velocity of water does not damage the seal of trap.

In some cases it is perfectly safe to ventilate the drain between house and disconnecting trap by means of a rain-water pipe, well jointed, and placed a few feet from the windows. It is not safe to use rain-water pipes as drain ventilators on any house having dormer windows; but what is suitable for one house may be quite the opposite for another. Only one safe principle can be applied generally for the drainage of every dwelling-house—that is, place a disconnecting-trap in manhole at the furtherest possible distance from the house, and place traps on each branch drain to soil and waste pipes, &c., and ventilate the drains between the traps as circumstances will permit. The soil, waste, and ventilation pipes should be extended full bore to the roof at a point well exposed to the wind but in no sheltered position, such as the side of a chimney stack or terminating on a gable. The upcast current will be very good if the pipe is taken about 2ft. through the side of an ordinary roof, if it is not suitable to extend it to the ridge.

The following tests will show all that can be obtained with the best arrangements as advocated by the sanitary associations and under the most favourable circumstances — viz., temperature at manhole grating in side wall, 46°; temperature at top of soil-pipes, 47°; manhole 9ft. deep with disconnecting trap, and length of drain 40ft., connected to 43ft. of vertical soil-pipe, giving an upcast current of air 48ft. per minute in a 4in. pipe. In another branch drain 80ft. long, off the same manhole, with soil-pipe 40ft. high, shows an average of 50ft. per minute of air passing up a 4in. soil-pipe. The wind was blowing at the rate of 300ft. per minute on the side of house where the 40ft. soil-pipe was situated.

The following is another test during a higher temperature and much stronger wind:—Temperature at air inlet on surface, 55°; temperature at top of soil and ventilation pipes, 55°; depth of drain at manhole, with trap, about 3ft., and length of drain about 30ft., and height of pipes 63ft., with a current of air passing through a 4in. pipe to the trap at the rate of 40ft. per minute. Perforated conical taps were fixed on the 4in. soil pipe and 3in. ventilation pipe, and when the taps were removed the air current increased to 70ft. per minute. The wind was blowing at the rate of about 900ft. per minute over the top of soil and ventilation pipes.

I beg to suggest that Mr. Buchan should go to "Holmhurst," and make an exact plan of the drains with the various traps, soil, and waste pipes, &c., and take the temperature at air-inlets and at top of soil and ventilation pipes; test the inlet current of air at each trap, also at inlet to manhole with disconnecting trap, and the wind-current passing over the top of pipes; and during the same day, if possible, test a house as executed on the principle recommended by the sanitary associations, and I can assure Mr. Buchan that the results will repay his trouble, and be of much interest to your readers.

Very few of our sanitary "engineers" and young architects, following in their footsteps, know the effect which the flushing of one water-closet alone has on the current of air in drains and soil pipes. A pan w.c. flushed by a 1in. pipe will cause a downward current in a 4in. soil pipe at the rate of 130ft. per minute, and a washout w.c. about 18ft. above the drain level, when flushed with about two and a half gallons of water, will cause a downward current of air in a 4in. soil pipe and 3in. ventilation pipe at the rate of about 300ft. per minute. A washout w.c. about 10ft. above the drain level, flushed with a three-gallon cistern and 1½in. pipe, will cause a downward current in a 4in. soil pipe and 1½in. ventilation pipe at the vate of 480ft. per minute. The above tests are given to show that it would be much better to have a down current in the soil pipes, and the up-current in a separate pipe connected near the house side of trap.

Sometimes the "desirable improvements" recommended by some sanitary associations are rather amusing, and as an illustration, I may state that a member asked a report on a large town mansion he had purchased, and among other improvements recommended, was the removal of all the hot-water copper pipes, because the *couplings were old fashioned;* and the sanitary engineer recommended iron pipes instead of copper. It may be needless to add that the copper pipes, with their old-fashioned couplings, still remain.—I am, &c.,

Clerk of Works.

CHIPS.

The extension of Fisher-row school, just carried out for the School Board of Musselburgh, near Edinburgh, has just been completed, and has been opened this week. Mr. Dunn was the architect.

Dr. Gunning, of Brazil and London, has commissioned Mr. W. Stevenson, sculptor, Edinburgh, to execute a bust of Hugh Miller for the Hall of Busts at the Wallace Monument on the Abbey Craig, Stirling.

The death is announced of Mr. George Sim, F.S.A.Scot., a well known Scotch antiquary and numismatist, in his 73rd year. He was caretaker of coins at the Edinburgh Museum, and at the time of his death was engaged on an important work on the coinage of Scotland. His own collection of Greek and Roman coins, comprising 13,000 specimens, is unequalled in Scotland for extent and variety.

The name of the winner of the prize in the Colour Decoration Class at the Architectural Association last session was Mr. Walter Dewes, of 13, Burghley-road, Highgate-road, N.W., and not as printed in the prize list on p. 574 in our last issue.

On Thursday in last week a special committee of the Shrewsbury town council sat to open the tenders received for the alterations at the Corn Exchange. The tender of Mr. Price was accepted at £925, being the lowest of four received. Mr. Whittingham was appointed clerk of the works, he having been employed in that capacity at the erection of the Barracks, Bicton Church, and Trinity Church, Shrewsbury. The alterations will be proceeded with at once.

A Jubilee wing is to be added to the Royal South Hants Infirmary at Southampton from plans by Mr. W. H. Mitchell, of that town, at an estimated outlay of £1,800.

A school of art has just been established at Exmouth, under the superintendence of Mr. Birkmyer, head master of the similar institution at Exeter. The committee was formally appointed on Saturday, and the school will commence work at once.

Important structural alterations are now being effected at St. Thomas's Church, Pendleton, from designs by Mr. Medland Taylor, of Manchester. Messrs. Beanland, of Bradford, are the contractors, and Mr. Reuben Bennett, of Manchester, is engaged upon the decorative work.

The joint committee of the Maxwelltown Police Commission and Town Council recently issued an invitation for competitive plans for a tower proposed to be erected on the burgh court house; and out of three sent in, that of Mr. James Halliday, architect, of Dumfries, was preferred. According to a Dumfries journal, as the prospects of raising the requisite funds are not very encouraging, it has been resolved not to proceed with the work at present, and a fee of no less than *three guineas* has been voted to Mr. Halliday for preparing the plan. Such generosity deserves wider publicity.

Mr. William Peel, of King-street, Manchester, and Prestwich, has been appointed surveyor to the local board of Prestwich out of 32 applicants.

Mr. Robert Hunt, F.R.S., late keeper of the Mining Records at the Museum of Practical Geology, died on Monday at his residence in St. Leonard's-terrace, Chelsea, aged 80 years. Mr. Hunt will be best remembered as the editor of three editions of Dr. Ure's "Dictionary of the Arts," and as the originator and for many years the compiler of the useful "Mining Statistics." He was the first appointed Professor of Mechanical Science to the Government School of Mines.

The chief corner stone of a Jubilee wing, now being added to the infirmary at Northampton, was laid by Prince Albert Victor on Tuesday. The wing, which will cost £4,000, is being built from designs by Mr. Hull.

Intercommunication.

QUESTIONS.

[9433.]—**Damp.**—In the case of a hall about 60ft. by 30ft., material common bricks, with cement facing outside and plastered inside, no damp-course was specified or supplied. The gutters were also insufficient to carry off a heavy rainfall, having, by directions of a "practical" member of committee, been cemented to a height of ⅝in. from top at one end, so as to insure a sufficient fall to the downspouts. Since completion eighteen years ago the walls have been dry for only short periods. At first the damp showed itself mainly near the floor line upwards; of late years the upper part of the walls have shown most damp, whilst the walls near the floor are decidedly drier. Do any of your readers know of a building having been erected without a damp-course? If so, will they be so good as to report the result, and if any remedy has been successfully applied? Is it probable that the damp from omission of the damp-course will eventually disappear altogether? The damp from the gutters can easily be remedied.—R.

[9434.]—**Refusal to Proceed.**—A. tenders to do a job for a certain sum of money, and he being the lowest, his tender is accepted by B. A. refuses to proceed with the work. Can B. compel him to do so, the usual contract form not being signed, and if you know of any case where it has been carried to court, would you kindly mention it? —W. VAUGHAN.

[9435.]—**"Killing" Cement.**—I was recently told by an experienced builder of railway bridges that before cement mortar is used it should be, to use his expression, "killed"—*i.e.*, after being mixed allowed to set partially, then remixed. This, I was informed, prevented the expansion of the mass of masonry, and did not impair the mortar. This method of building being contrary to what one generally finds specified, I should be glad to know the opinions of a few experienced readers of the BUILDING NEWS.—DOUBTFUL.

[9436.]—**Varnish on Old Engravings.**—Will some reader kindly inform me how to remove varnish—in this case ordinary copal—from old coloured engravings, also dirt or stains, without damaging the engravings?—CRAWFORD.

[9437.]—**A.S.I. Exam.**—Will a reader give best books to study for the A.S.I. exam. in the building division for other than students in following subjects—1, Trigonometry as applied to surveying; 2, Laws of Fixtures, dilapidations, easements, light and air; 3, Composition and properties of stone and cement; 4, Prices, &c.?—NO SIG.

REPLIES.

[9412.]—**Eyesight.**—I am obliged to "J. H. W." and "E. C. P." for their advice in respect to my query *re* the above; but I cannot see how it is possible for a draughtsman to obtain a good light for working on a sheet of paper, say, double elephant size, when the source of that light is behind him, for the shadow thrown by his body must of necessity fall on some portion of the paper. I can easily manage to read a book with the light behind me, and always do so; but when the eyes are to wander over so large a surface I cannot conceive it possible. As to washing the eyes, I have adopted "E. C. P.'s" plan, and have carried it out for many months, but am unable at present to say I have found much benefit from it. Any other suggestions they, or any other of your numerous readers, may throw out, will no doubt be of service to many others besides myself.—VEDRA.

[9415.]—**Mun. and San. Engineer's Exam.**—The following list gives the books from which information can be obtained for above examination in order of subjects:—Haskoll's "Land and Engineering Surveying," Neville's "Hydraulic Tables," Box on "Hydraulics," Latham on "Sanitary Engineering," Hughes on "Water Supply," Humber's larger work on same, Inst.C.E. special lectures on "Hydro-Dynamics, Hydro-Geology, &c." (two years ago), "Society of Arts Conference at Health Exhibition" (published by them in separate pamphlet, 1s.), Law and Clark on "Roads and Streets," Rivington's "Building Construction" (3 vols.), Seddon's "Builders' Work," Hurt's or Tarn's "Tredgold's Carpentry," Knight's "Annotated Model By-Laws," also "Notes on Model By-Laws" in *Sanitary Record* of November, December, 1886, January, March, June, &c., 1887; Hood's "Heating and Warming for Ventilating," Box on "Heat," Wilson's "Hygiene," Robinson's "Sewage Disposal," Royal Commission on Metropolitan Sewage Discharge (lately issued), Corfield on "Sewage Disposal for House Drainage," Latham, Hellyer, and Davies on "Sanitary Plumbing," "Health Exhibition Handbook on the Dwelling," Glen and Lumley on "Public Health Act and Rivers Pollution Act"; and for much valuable information and the latest practice on many of foregoing subjects see Boulnois' "Municipal Surveyor's Handbook," *Proceedings* of the Institute of Civil Engineers, ditto of the Municipal Engineers, and the professional journals. Any person intending to sit for above examination should send to Mr. T. Cole, 6, Westminster Chambers, Victoria-street, S.W., for copy of list of subjects, and also for syllabus of examination questions which have already been set.—A BOROUGH ENGINEER AND A MEMBER OF THE ASSOCIATION OF MUNICIPAL ENGINEERS AND SURVEYORS.

[9423.]—**Expansion of Portland Cement Concrete.**—The footpaths in this borough have been laid with Portland cement concrete since 1880 on the following specification:—"EXCAVATING: To be carefully dug out to the required depth of 9in. below the top of the kerb and top of pegs next the wall of houses. A subsoil drain of 4in. common field-pipes laid at least 2ft. below the top of kerb and cement footway, and trapped before entering the sewer; after the excavation has been dug out and drain laid and certified by the surveyor, the trench of the drain to be filled in with broken slag, scars, or clinkers, properly beaten in to the required depth for the kerb. CEMENTING.—The cement shall be in the corporation yard 14 days before it is required for use, and shall be tested to bear a strain of 330lb. to the square inch. Crushed granite (Dalbeattie preferred) about ⅝in. cubes with not more than 20 per cent. of fine which will pass through a No 20 sieve of 20 meshes to the inch. The footway is to be prepared with a foundation of broken slag 6in. thick, the slag at the top to be so broken as to be able to pass through a 2in. ring, and then coated with the best Portland cement well mixed with crushed slag in the proportion of four parts of slag to one of cement, and laid on the broken slag bottom to a thickness of 2in., which, by filling up the interstices, will raise the surface 1½in.; on this surface at the proper time when the first coat is not set but ready to receive it, a finishing coat of cement, of one part of cement mixed with two parts of crushed granite or whinstone chippings is to be laid and well spread and beaten to bring the moisture to the surface, and to be 1½in. in thickness. The outer edge shall form a kerb 12in. deep and 4in. wide at the bottom, and shall be continuous with the footwalk. The whole to be lathed with a rise from the outer edge or kerb of half an inch to the foot, and to be laid in four or five feet lengths alternately, properly laid on the edges and truly square from the kerb. *After the cement has been set 24 hours the intermediate slabs are to be filled in (the laths being first removed) and a neatly-struck joint to be drawn at the division line. Opposite every door or suitable place, a small square about 1ft. 6in. wide to be left open until the squares are properly set, to allow for expansion*, and for the conveyance of a gas-pipe when required, and a (×) mark to be chiselled out on the kerb and on the footwalk next the house over the part. A small square (24in. by 18in.) with letter T cut in it to be formed in cement over each trap. The contractor to provide a night watchman and a sufficient number of tarpaulins to protect the cement from damage during heavy rains." I have observed the expansion in a number of cases where the footpaths have been laid, in two streets, crossing each other, and joined at the end. The expansion may be seen by the cement being forced from the walls at the corner of the streets. The greatest expansion I have observed was ⅜in. in a street 280ft. in length, and in many other cases ⅜in. and ¼in. may be found in different parts of the town. The expansion must be very much greater than what I have stated, where the cement is laid in a continuous piece, without leaving squares out for gas services to houses. There is a flight of stone steps leading to a bridge across the railway adjoining the station here. After the steps had been so worn by the constant traffic as to be considered dangerous, the part worn was cut out in the middle of the steps, leaving about 4 to 5in. at each end of solid stone. The space cut out was then filled in with Portland cement and crushed granite (I do not know what proportion the cement bore to the crushed granite). The result was the ends of the steps were broken and remained so. One step is splintered at both ends, and projects ¼in. or ⅜in. This I did not measure.—PETREE.

[9424.]—**Gable Ends.**—"Enquirer" should first of all see what are the conditions relating to gables or party walls on the estate on which A. has built. I am architect to some large building estates in the North, and the rule is that the gable-wall shall be a party-wall, the centre to be the division between the two owners, the party building first to be repaid by the one building against him, half the cost of such gable or party-wall. A. should have looked to this before having his land conveyed to him, and not have had conveyed the whole of the wall. I am afraid there is no claim against B., because he has built entirely on his own land. From the look of it, I imagine there has been some difference between A. and B., as it would have been less trouble to B. to buy a share of the wall than build an additional 4½in. against it.—J. W. D.

[9425.]—**Cement Concrete Footpaths.**—The cause of breaking up may be difficult to define. I have had a similar experience to "Castrum." Where the upper surface was 1½in. thick of crushed granite, 2 parts to 1 part of Portland cement, the lower strata of crushed blast-furnace slag, 4 parts to 1 part of cement. The slag appeared as if coated with the fumes from sulphur. The footpaths had to be relaid by the contractor. Blast furnace slag from a different district, which showed no signs of sulphur fumes, has not broken up. The percentage of broken footpaths in this district is very small when compared to the quantity laid.—JARROW.

[9425.]—**Cement Concrete Footpaths.**—The specification of materials appears to be all right, and the fault may be found in the bottoming or substratum. "Castrum" should examine the bottoming and ascertain if the riddlings of lime shells were mixed with the stone and bricks, and if such is not found to be the case, send a sample of crushed brick and cement to be properly analysed.—CLERK OF WORKS.

[9427.]—**Cheap Public Baths.**—It is not easy to answer 'Enquirer" in a few words with respect to the above. If he wants a really cheap and good public bath he will have to go to the riverside in some country place; but for public baths in towns, the bottom has been touched in several instances within recent years, and I should be glad to give him what information I have on the subject, or put him in the way of working it out for himself if he writes and makes known his wants to me. I enclose my address.—E. PHILLIPS, 90, Bolton-road, Manchester.

[9432.]—**Black Stains in Varnished Stained Deal.**—"H. H." does not explain if he used water or oil stain, and has not stated the kind of varnish used. If water stain and good varnish were used, the defects are certainly in the wood. If good oil stain was used, no spots would appear on good wood. Is there not sap-wood on the back of the dado framing and panels? If not, the timber used has been from deals and planks, and not taken from logs, as it should have been, for staining and varnishing.—CLERK OF WORKS.

The corporation of Nottingham, in response to an advertisement inviting applications for the post of water engineer, recently received over ninety replies. Nine were selected by a committee, numbering Messrs. H. J. Clarson, of Tamworth; L. J. Godfrey Evans, Liverpool; J. E. Hughes, London; Lake, Lancaster; W. A. H. de Pape, Tottenham; H. Preston, Grantham; C. H. Priestley, Cardiff; Whitton, Nottingham; and Whillink, Vyrnwy; Works. The committee, by nine to four, decided in favour of W. A. H. de Pape, M.I.M.E., engineer to the Tottenham Local Board of Health, subject to confirmation by the town council.

LEGAL INTELLIGENCE.

IN RE W. B. SIVELL.—At the Rochester County Court on Wednesday week, Mr. J. Basset applied to his Honour Judge Homersham Cox for the discharge of a bankrupt named William Bass Sivell, of Crockenhill, architect. The Official Receiver (Mr. R. Prall) opposed, and said there were unsecured creditors to the amount of £1,700. Mr. Basset pressed for the discharge, and asked that the bankrupt should be allowed £300 a year. The Official Receiver said £150 was enough; but eventually the Court ordered the bankrupt's discharge, and allowed him £200 a year, all income above that amount to be paid to the trustee.

OMITTING NOTICE TO DISTRICT SURVEYOR. Worship-street Police Court, Oct. 15th, 1887. Before Mr. Bushby.—District Surveyor for East Hackney (North) *v.* Brooke, Simpson, and Spiller (Limited).—The defendants had executed works to four buildings without notice to the district surveyor, who summoned them for penalties in respect of the offences. Defendants' counsel objected that the summons was addressed to the old firm instead of the present company; but the district surveyor produced a letter from the company on the subject of the summons, and the summons was amended by the addition of the word "Limited." The defendants claimed exemption under Sec. 6, contending that the clause was to be construed as "60ft. from the nearest buildings (and ground) of an adjoining owner." Included in one alleged offence was the repair of an external wall, in which about 100 new bricks showed on the face of the wall, and the district surveyor considered this was a repair affecting the construction of the wall, because if the new work had been taken away the brickwork over it would have fallen. The magistrate decided that the context of the part of the exempting clause referred to, as well as the general policy of the Act, shut out the construction put upon it by the defendants, and, as the buildings to which the works were done were within 60ft. of other buildings belonging to the defendants, the district surveyor was entitled to notices. The repair was not to be considered a work requiring notice, because old bricks were simply replaced by new, and there was no alteration, as if stone had been substituted for bricks, or the wall had been made thicker. The defendants were fined £4 and 12s. 6d. costs.

CHIPS.

The condition of the rivern Cam, and the recent letters by Dr. Alfred Carpenter and others, were discussed by the Improvement Commissioners of Cambridge on Tuesday. The chairman of the board stated that a report on the proposed diversion of the town sewage from the river would be presented to the board in a short time. The surveyor was making inquiries and investigations into the present conditions of the sewers of the town, and would soon make his report to a special committee.

Mr. James Reid, of the firm of Messrs. John Reid and Son, cabinet makers, Park-row, Leeds, died suddenly when in London on Friday night. Mr. Reid was well known locally as a connoisseur in art, a topic upon which he occasionally lectured and wrote, and he has left behind him a work which was almost ready for publication. The firm had opened a branch in the Metropolis, and Mr. Reid had taken a house there on the previous Wednesday.

At a meeting held in Rochdale on Monday, the Mayor said the condition of the Rochdale Town Hall had been exaggerated. No one would deny that the building was not what it ought to be, and it was a great shame that the work had been scamped, and improper material used. But two persons who had examined the building agreed that the cost of the necessary repairs would not exceed £1,200.

At the annual meeting of the incorporation of Mary's Chapel, Edinburgh, held on Monday, Mr. Robert Paterson, architect, was elected Deacon of the Masons, and Mr. John White, plumber, was elected Deacon of the Wrights and treasurer for the ensuing year.

On Tuesday evening, at the Rotunda Lecture Hall, Liverpool, Mr. John A. P. Macbride, lecturer on sculpture at the British Museum, delivered the first of a course of lectures, entitled "How a Marble Statue is Made."

The City Court of Common Council received yesterday (Thursday) a report from a committee recommending that the office of architect, rendered vacant by the death of Sir Horace Jones, be not filled up, but that in lieu thereof a "surveyor" be appointed at a salary of £800 a year.

The statue of Mr. Samuel Morley at Bristol, executed by Mr. Havard Thomas, now of Chelsea, a native of that city, will be unveiled to-morrow (Saturday).

WATER SUPPLY AND SANITARY MATTERS.

Acton, W.—The members of the Society of Engineers and friends visited on Wednesday the new sewerage works at Acton, the refuse destructors at South Ealing, and the new reservoir in course of construction at the Grand Junction Waterworks at Ealing. The party were received at the Acton Sewerage Works by Mr. C. Nicholson Lailey, the engineer to the board. The local board has formed a drainage system for its own district, independent of the Metropolitan main drainage, and has adopted the purification system of the International Sewage Purifying Company, in which the purification is effected by a combined process of precipitation and filtration. The works as now constructed can deal with the sewage of a population of 20,000, and have cost £70,000. The refuse destructors at South Ealing, while generally based on the plan of Fryer's destructors, have some distinctive points devised by Mr. Charles Jones, the engineer to the Ealing local board. Here the sewage sludge of 19,000 people, and the house refuse of 22,000, are being dealt with. The new storage reservoir now in course of construction in connection with the Grand Junction Waterworks is situated near Hanger Hill, to the north of Ealing, and occupies ten acres of land. The water surface, when full, will be about six acres, and it will contain about 51 million gallons. It will be used for the storage of filtered water, filled from the pumping station at Kew-bridge, through a line of 30in. pipes. The work is being carried out under contract by Messrs. Aird and Sons: Mr. Alexander Fraser being the engineer to the Grand Junction Water Company.

Hornsey, N.—A Local Government Board inquiry was held at Highgate on Thursday, the 13th inst., by Mr. John Thornhill Harrison, C.E., to consider the application of the Hornsey Local Board with reference to the borrowing of £12,000 for the erection of a Fryer's dust destructor and other works of public improvement, in accordance with plans submitted by Mr. T. De Courcy Meade, their engineer. The Board was represented by Mr. Littler, Q.C. The proceedings were almost formal. After evidence given by Professor Tidy, Mr. T. De Courcy Meade, C.E., Mr. Andrews, C.E. (Bournemouth), Mr. Bennett, C.E. (Southampton), and others, the inspector expressed his satisfaction with the plans and closed the inquiry. The local board await the formal sanction only of the Local Government Board in order to proceed with the works, the carrying out of which will revolutionise their present system by taking the entire work of dust collecting and scavenging into their own hands, instead of letting it out to contract, the latter system not having proved very satisfactory of late.

STAINED GLASS.

Kimbolton Parish Church.—The east window of this church, which is of four lights with tracery in the 15th-century style, has just been filled with stained glass, representing the "Adoration of the Magi." In the second light is the figure of the Blessed Virgin seated with the Holy Child on her knee; and in the third light two of the kings with an attendant bearing gifts; above these two groups is a choir of angels singing the "Gloria in Excelsis." No. 1 light contains St. Joseph and two angels in adoration of the Child, and in the fourth light is the Ethiopian King. In the foreground are a lamb and doves; while in the background are the town of Bethlehem and the surrounding country. The whole picture is surmounted by canopies of the Perpendicular period, and based by an arcading containing angels. In the tracery are angels playing musical instruments, cherubim and seraphim, and above all the miraculous star. The whole was designed and executed by Messrs. A. O. Hemming and Co., 47, Margaret-street, Cavendish-square, London, W.

St. Lawrence Jewry.—This fine City church has just been enriched by the addition of a large stained-glass window of Classical design, containing a large figure of St. Luke, and subjects of the parables of "The Lost Sheep," "The Lost Money," and "The Prodigal Son," in two scenes. Above, in the circular head, is a group of five angels rejoicing over "The One Sinner that Repenteth," while, at the base is the winged bull. The ornament throughout the window is rich, and full of delicate detail, and the whole is surrounded by a border of ornament. The work has been designed and executed by Mr. Alfred O. Hemming, of 47, Margaret-street, Cavendish-square, W., under the supervision of Mr. A. W. Blomfield, M.A.

A stained-glass memorial window was unveiled at Crambe, near York, on Tuesday week. The window, which is of two lights, representing Christ the Good Shepherd, and The Light of the World, has been executed by Mr. J. Knowles, of York.

Our Office Table.

We should like to see something come of the proposal now being discussed in our correspondence columns to found a Provident Institution for Architects' Assistants. We assisted many years ago in the foundation of a similar society for Builders' Clerks, which is now firmly established, and is doing good work. We suggest that the assistants should meet together informally and ask the Institute, or the Society of Architects, for a room at Conduit-street or St. James Hall to hold a public meeting. If at the Institute, the secretary of that body would probably contribute the benefit of his aid and experience; if at the Society, Mr. Farman or Mr. Middleton might no doubt be induced to assist in a similar manner. If established, it would in every way be desirable, if possible, that the permanent office of the Architects' Assistants' Provident Society should be located at one or other of the headquarters of the Metropolitan professional societies.

The question of the payment of travelling expenses to an architect living at a considerable distance from the works in progress formed the subject of a discussion at the last meeting of the Sunderland town council. It will be remembered that in the competition for the new municipal buildings now in progress the designs of an Ipswich architect, Mr. Brightwen Binyon, F.S.A., were selected, and the works were intrusted to him. The town council received a report from the buildings committee again recommending, on reconsideration of the subject, that Mr. Binyon be paid his railway fare (first-class) for his journeys to and from Sunderland required during the progress of the work. The recommendation was objected to on the ground that when the competition was drawn up it was stated that the 5 per cent. commission would include "all services and everything," although railway fares were not expressly mentioned. The town clerk pointed out that the report ought to be agreed to, for, as a legal point, railway fares were not "services." After an undignified discussion on this point, it was proposed that the amount of Mr. Binyon's railway fares should be limited to a hundred guineas, to which it was replied that by limiting the sum to be expended they would also limit the number of Mr. Binyon's visits. The town clerk said Mr. Binyon had consented to accept his railway fares without charging hotel expenses. The motion having been withdrawn, the report of the committee was carried by 28 votes to 12 against.

In the last issue of the Proceedings of the Royal Society, Professor Carnelley, of Dundee, and Mr. J. S. Haldane, M.B., give the results of their recent investigations into the nature of sewer air which, if correct, affords grounds for belief that sewer gas is neither so dangerous to human health nor so frequently the causes of the spread of zymotic diseases as had been assumed of late years by sanitary engineers and others. It will be remembered that Mr. Haldane read a paper on this subject before the Sanitary Congress at Bolton a month since, which attracted considerable attention. The author's experiments showed that although the sewer air contained twice as much carbonic acid and three times as much organic matter as the outside air, the number of microbia present was much less. Indeed the air of sewers had the advantage as regarded the presence of microbia over that of any class of dwelling house. The organic constituents of sewer air, when filtered off, were apparently harmless. As the number of microbia decreased with the increase of carbonic acid, it appears that the less ventilation there was, the smaller was the number of microbia, and thus it appears probable that microbia entered the sewer air from the exterior rather than arose from decomposing matter in the sewer itself. The experiments strengthen the growing opinion of micro-biologists that zymotic diseases are conveyed in liquids, such as milk or water, rather than through an atmosphere containing free oxygen.

A peculiar case of church tower "restoration," well worthy the attention of the S.P.A.B., has just been completed at Woolfardisworthy, near Bideford. The tower is a square one, standing 80ft. high, and it was found that though the whole of the inner or eastern wall of the tower was a good one, the west wall of the tower had for some time bulged out, and was in a dangerous condition. Mr. Arnold Thorne, architect, of Barnstaple, proposed to restore the tower by literally cutting it vertically in two, taking down the west side from top to bottom and part of the north and west sides, and to reface the remainder, leaving the whole of the east side and corners standing to the full height of 80ft. Incredible as it may appear, the vicar, the churchwardens, and parishioners adopted this somewhat hazardous plan of mutilation, and, according to the local newspapers, Mr. Thorne has accomplished the task, and restored the tower to its original position and strength, the work having been carried out by Messrs. Sanders and Cook, Northam. The peal of bells has also been rehung by Mr. J. Abbott, of Bideford. The total cost of the work was about £300. The tower was reopened at the harvest thanksgiving services last week.

A rather stupid attempt was made on Wednesday at the Birmingham Board of Guardians to call in question the discretion of the Workhouse Management Committee in accepting the tender of Messrs. Strode and Co. for gas services at the new infirmary. Seven tenders had been received—the highest, from the Corporation of Birmingham (which manages its own gas supply), being £871 7s. 1d.; and the lowest, £545 15s. Messrs. Strode and Co.'s tender was just midway, being £685, and the strong presumption is that the guardians have got the best work at the lowest price. The dissentients, who wanted to give the work to one of the three local firms which tendered lower than Messrs. Strode and Co., should remember that some discretion must be left to committees, and that in these days of "lowest tenders" it is rather in the selection of good firms to do work at fair prices than in the cutting-down system that the true interests of the ratepayers is studied.

The *Russische Revue* of St. Petersburg states that 56 per cent. of the total area of Finland is either forest or marsh covered with forests. Approximately, half of this belongs to the Crown, and half to private owners. For some years past the export has remained stationary at about 50 millions Finnish cubic feet, but in 1885 it decreased to 41 millions, and in 1886 it was about 20 per cent. less. Hence much less timber has lately been felled, and those interested in the trade look for an increase in the price of timber. The export to all the British ports, such as London, Liverpool, Grimsby, Hull, Hartlepool, &c., was very much reduced. Apart from the general depression of trade, this decrease is attributed to a decreased demand for timber, the increase of freight, and the want of shipping in the ports of Finland.

The United States Government have just published a series of reports by their consuls on forest culture and forest preservation in Europe, regarded from a practical standpoint, so that the replies may serve as a basis for framing forestry legislation at home. The questions cover every matter of importance connected with forestry and forest administration. The reports include Austria-Hungary, France, Germany, Italy, and Switzerland, and are exhaustive in character. They come from every district in each country in which a Consul resides, the task of dealing with the general legislation of the country being left to the Consul-General. The reports deal with their subjects under the following heads:—(1) Areas under forests, distinguishing (where possible) between State and private areas; (2) common forests, if any, and privileges of the population in them. If pasture is permitted, how are the trees, &c., protected; (3) organisation and functions of Government forest bureaux; (4) revenues from Government forests, costs of maintaining or managing forests, profits of cultivation; (5) forest planting and culture, methods, bounties, if any, schools, their organisation and course of study; (6) destruction of forests, causes and results; (7) reclamation of sand dunes or waste places by tree planting; (8) sources of lumber supply, trade in lumber, bounties on importation, if any, and customs duties; (9) names of three reliable sellers of seeds and shoots in each district; (10) copies

and translations of the forest laws of each country or locality.

A few years ago, says the *North-Western States Lumberman*, there was little, if any, lumber sawed in the States quartered, or with the grain. Now not only oak but many other woods are being sawed more and more in that manner. Every consumer of lumber believes that it is by far the better way to manufacture. We now have oak, poplar, gum, and sycamore in large quantities thus sawed. It costs more to saw quartered stock than plain, but it is much more valuable. The waste is considerable. Take a 24in. 12ft. log, clear and straight, and 75 per cent. of it will make good quartered firsts and seconds if properly managed. Probably no wood except oak has so grown in popularity as quartered poplar. It is used "plump" inch, 6in., and up wide, and immense quantities are now used by piano manufacturers. There is a scarcity of it, and anyone who finds plain poplar dull and hard to sell should quarter-saw his stock, as it will then be worth from 2 dols. to 5 dols. a thousand more.

MEETINGS FOR THE ENSUING WEEK.

Saturday (to-morrow).—Clerks of Works' Association. Excursion to Cambridge, to be conducted by Mr. G. Dalton, clerk of works at St. John's College, in that town. Train from Liverpool-street, 9.10 a.m.

Tuesday.—Glasgow Architectural Association. "The Architect's Assistant," by J. J. Burnet, F.S.A.

Wednesday.—Institute of Auctioneers and Surveyors.

CHIPS.

Messrs. Steven Bros. and Co., of 4, Upper Thames-street, and Milton Ironworks, Glasgow, have secured the first award for their kitcheners, and the same for their ornamental and architectural ironwork at the recent Adelaide Exhibition. Wherever exhibited Messrs. Steven Bros.' kitcheners have never failed to secure the highest award, and the popularity attained by their ranges has, we believe, been well deserved, both as regards the excellency of design and quality of material and workmanship. Their architectural ironwork is also daily growing in favour with the profession and the public.

The Austin Memorial Almshouses, erected by the Mayor of Glastonbury in memory of his late wife, were opened on Friday. They are four in number, are situate in Magdalene-street, Glastonbury, and are built of brick, with Bath stone dressings, and Broseley tiled roofs and verandahs. Messrs. Budd and Spire, of Glastonbury and Shepton Mallet, were the architects, and Mr. Henry Hawkins was the builder.

The church of St. Peter at Gowts, Lincoln, is being rebuilt, with the exception of the fine tower and south aisle, from designs by Mr. C. Hodgson, F.S.A., of Durham, and will be opened in December. Messrs. H. S. and W. Close, of Lincoln, are the builders; and Mr. S. C. Basker is the contractor for joinery.

The Swinton Local Board, who have been served with notices by both Captain Dauntesey, of Agecroft Hall, and the Salford Rivers Conservancy Company, to cease polluting Slack Brook, Pendlebury, and the river Irwell, have invited Mr. Vawser, C.E., of Manchester, to visit Pendlebury and report upon the scheme prepared by the board's surveyors for dealing with the sewage of the district. The board have purchased several acres of land for erecting precipitation and other works.

The new buildings erected in the Finchley-road, Hampstead, to take the place of the old Hackney College, in Well-street, for the training of students for the Congregational ministry, were opened on Wednesday. The new buildings, with purchase of the land and furniture, will cost about £23,000, and will provide residential and other accommodation for the principal and 36 students.

Memorial stones of a new Baptist school-chapel at Honor Oak, S.E., were laid on the 8th inst. The style adopted is Early English, the materials are red bricks and Bath stone dressings, and the chief room is 61ft. 6in. by 32ft. 6in. Mr. Geo. Bains, Great Winchester-street, E.C., is the architect, and Messrs. F. and H. F. Higgs have taken the contract at £1,093.

As the church of St. Olave Jewry is about to be demolished, notice has been given as required by the Act 23 and 24 Victoria, cap. 142, that it is proposed to remove the remains of all persons interred within the fabric to Little Ilford cemetery, the tablets and monuments being at the same time transferred to, and set up in, the parish church of St. Margaret, Lothbury, to which St. Olave's has now been united.

An insignia rest has been placed in front of the corporation seat on the south side of the nave of St. Mary-le-Tower Church, Ipswich. The rest is constructed of hand-wrought and hammered on, and is designed after the 16th-century German work. It consists of delicate scrollwork springing from a main stem. The civic sword will be placed in the centre with the point upwards, the hilt resting on a scrolled bracket, and the blade in its scabbard held in position in an opening in the scrolled arm above. On either side is a curved support, and in these the two maces were placed. At the end of the bracket for the sword is a rest for the Corporation silver oar, formerly the sign of the office of the water-bailiff, and below is a shield of the borough arms and crest. The whole is to be treated in colour. Mr. John Shewell Corder, 9, Thoroughfare, Ipswich, designed the rest, and prepared full-sized drawings from which Messrs. Hardman and Powell, of Birmingham, carried out the work.

John Watson Bertie, a joiner, of Dundee, was remitted to the sheriff of that burgh on Monday on a charge of embezzlement. It is alleged that, while acting as secretary to the Dundee branch of the Amalgamated Society of Carpenters and Joiners, he appropriated sums amounting to £15 10s.

The salary of the borough surveyor of Christchurch, Hants, has been raised by £30 a year.

The work of deepening by 3ft. the Upper North Forty-foot Drain, near Boston, for a distance of four miles, has just been completed. The work has been carried out under the direction of Mr. James Lancaster, of Boston, surveyor to the Second District Drainage Commissioners.

The memorial stones of a new Wesleyan chapel at St. Catherine's, Lincoln, were laid on Thursday, the 13th inst. The edifice will be semi-Gothic in style, and accommodation will be provided for 520 people. The total cost of the undertaking (including the value of the land) will be about £3,000. The plans have been prepared by Mr. Chas. Bell, architect, of Dashwood House, New Broad-street, London; the builders are Messrs. Thompson and Son, of Louth; and the superintendence of the work is left in the hands of the chapel steward, Mr. J. Weighell, builder, of St. Botolph's.

The first public trial of the electric light at Leamington took place on Saturday evening, when the Parade and Bath-street were lighted. The works for supplying the light are in Wise-street, where engines, boilers, and dynamos have been laid down by Messrs. Roby and Co., of Lincoln. The machinery and entire plant are in duplicate. The proprietors of the works are the Midland Electric Light and Power Company, who have arranged with the Corporation to light the Parade and Bath-street, and to supply the light to the Town Hall and the Pump Rooms. A large number of the principal tradespeople have given orders for private supplies of the light.

The new organ, built by Wilkinson and Sons, of Kendal, for St. Chad's Church, Everton, from the specification of Mr. C. S. Ridley, was opened by the latter gentleman on Wednesday evening last.

A new wing is about to be added to the Mercers' Hospital, Dublin, from plans by Messrs. J. H. Brett and W. M. Mitchell, of that city.

A marketplace and shambles together, with three dwellinghouses and shops, are about to be built at Hemel Hempstead, for the high bailiff, town commissioners, and vicar, acting as an improvement committee. The plans of Messrs. G. and W. R. Low, of Basinghall-street, E.C., have been adopted.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, post free.—LESSER FRIEDLANDER, Tobacconists' Complete Furnisher, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 60 years.

Depression of Trade.—Complaints about the falling off in consumption of many articles are loud and universal, but there is one exception to the prevailing dulness, viz.: GRANT'S MORELLA CHERRY BRANDY, for this popular liqueur not only maintains its position, but continues to increase in favour notwithstanding the efforts to supplant it by rubbishy imitations. Observe our branded corks and capsules. Sold by Wine Merchants, and by THOMAS GRANT and SONS, Maidstone, and 46, Gresham-street, E.C. Makers of the delicious Morella Marmalade. Sold by Grocers.

INFRINGEMENT.—WRIGHT'S PATENT FIREPROOF FIXING BLOCKS FOR WALLS AND FLOORS.—It having come to the knowledge of Messrs. J. Wright and Company that some person or persons have been offering to Architects an imitation of Wright's Patent Fixing Blocks, NOTICE IS HEREBY GIVEN that LEGAL PROCEEDINGS will be taken against ANY PERSON who infringes the said Patent, Registration, or Copyrights belonging to Messrs. J. Wright and Company, No. 3, Westminster Chambers, London, S.W.—FORD and FORD, Solicitors for the said Company, The Outer Temple, Strand, W.C. CONTRACTORS and OTHERS are respectfully cautioned against using IMITATIONS or Infringements of the said Patent, &c., as by so doing they render themselves liable to Legal Proceedings and Penalties.

Holloway's Ointment.—This cooling Ointment perseveringly rubbed upon the skin, is the most reliable remedy for overcoming all diseases of the throat and chest. Quinsey, relaxed tonsils, sore throat, swollen glands, ordinary catarrh, and bronchitis, may be arrested as soon as discovered, and every symptom banished by Holloway's simple and effective treatment.

DOULTING FREESTONE.

THE CHELYNCH STONE.—This Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

HAM HILL STONE.

Greater facilities have been provided for working these Quarries and the Stone can be supplied in large quantities at short notice. Prices and every information given on application to

CHARLES TRASK and SONS,
NORTON-SUB-HAMDON, near ILMINSTER, SOMERSET.
London Agent:—
E. A. WILLIAMS, 16, Craven-street, Strand.

HYATT'S LENS and "SEMI-PRISM" LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

BATH STONE.

PICTOR'S MONKS' PARK. CORSHAM DOWN.
BOX GROUND. FARLEIGH DOWN.
COMBE DOWN. STOKE GROUND.
WINSLEY GROUND. WESTWOOD.
PICTOR and SONS, BOX, WILTS.

BEST BATH STONE.

FARLEIGH DOWN, CORSHAM DOWN,
BOX GROUND, COMBE DOWN,
WESTWOOD GROUND.
STOKE GROUND.
RANDELL, SAUNDERS, & CO., LD.,
CORSHAM, WILTS.

NORTH'S IRON BUILDINGS AND ROOFING.

Kitchen, Parlour, and Bedroom, £21; 13 by 26, £25; 12 by 33, £27; from Railway Works. SALE or HIRE. Some 1s. Sheets. IRON CISTERNS, all sizes.
LONDON ROAD, SOUTHWARK.
WORKS and STORES, MORDEN, SURREY.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BANGOR.—For the erection of the Lord Penrhyn memorial wing, and also a laundry, at the Anglesey and Carnarvonshire Infirmary. Mr. Kennedy, architect:—

Williams, E.	£645 0 0	£200 17 0

(Accepted for both works.)

BOURNEMOUTH.—For pianoforte warehouse, for Messrs. Price and Sons. Messrs. Lawson and Donkin, architects:—

George and Harding	£1,295 0 0
James, G.	1,175 0 0
Rigler and Crane	1,170 0 0
Hoare, F., and Son	1,149 0 0
Beavan, G.	1,098 0 0
Barrow and Entwistle	1,089 0 0
Lucas and Cosser	997 0 0
Walden, F.	986 0 0
Scott and Mitchell	985 0 0
Hoare, W.	948 0 0
Jenkins and Son	945 0 0

BOOTLE, LIVERPOOL.—Accepted tenders for various works, for the town council:—

For the construction of filter beds and storage tanks at the public baths:—
Holme and King £2,157 2 0

For the construction of police cells and charge office under the police court:—
Bell and Burnie... ... ... £165 10 0

For additional staircase from the gallery at the town hall:—
Wilkinson, J. W., Bootle £33 10 6

BRIDGWATER.—For the re-erection of Crippshalted Bridge at the Brue Outfall, for the Somerset Drainage Commissioners:—
Durnford and Son, Bristol (accepted) £148 6s. 0d.

BRIGHTON.—For the erection of Jubilee Clock Tower, Brighton, for Mr. J. Willing :—

Smith, G., and Co, London... ...	£1,544	0	0
Barnes, J., Brighton...	1,470	0	0
Carey and Corben, London ...	1,452	0	0
King Bros. and Co, Norwood ...	1,442	0	0
Philips, W., and Co, Brighton ...	1,416	0	0
Cheeseman and Co, Brighton ...	1,410	0	0
Chappell, J. T, London	1,342	0	0

BURY ST. EDMUNDS.—For the erection of a gate lodge at the Free Grammar School, Bury St. Edmunds, for the governors. Mr. F. Whitmore, Chelmsford, architect :—

Frost	£216	10	0
Robinson, Jun....	234	0	0
Tooke, F. (accepted)	208	0	0

All of Bury St. Edmunds.

CHELMSFORD.—For alterations to Boarded Barns Farm, Chelmsford, for Sir H. B. P. St. John Mildmay, Bart, Dogmersfield Park, Winchfield. Mr. F. Whitmore' Chelmsford, architect :—

Beaumont	£250	0	0
Moss	241	0	0
Baker (accepted)	235	0	0

CLEVEDON.—For the jubilee memorial almshouses at Clevedon, Somerset. Messrs. Barker and Cross, Weston-super-Mare, architects :—

Forse, H....	£450	0	0
Green, W.	386	0	0
Dowland, W. (accepted)	295	0	0
Pollard, A.	230	0	0

DULWICH, S.E.—For the formation of carriage roads and a lake at Dulwich Park, for the Metropolitan Board of Works :—

Bath and Blackwell (accepted) ... £16,400 0 0

EDINBURGH.—For the enlargement of Davie-street School :—

Accepted tenders :—

Mason :—

Chambers, T.	£1,267	15	0

Joiner :—

Cormack, A.	762	0	0

Plumber :—

White, J.	161	0	0

Plasterer :—

Ross, J....	100	0	0

Painter :—

Ross, R. J.	50	8	9

Slater :—

Lamb, T., and Son	37	19	0
Total	£2,379	2	9

[Probable total cost of Davie-street School :—Existing school buildings acquired from the Heriot Trust, £2,368 16s. 8d.; new buildings and alterations £2,379 2s. 9d.; cost of furniture and fittings, £34); extra work, add 7½ per cent., £203 18s. 6d; architect's commission at 3 per cent., salary of clerk of works, and superintendence, £145; legal and other expenses, £63 2s. 1d.—total, £5,500.]

EDINBURGH.—For the erection of a new water service reservoir at Comiston, for the Edinburgh water trustees : Henderson, Matthews, and Co., Edinburgh £606 8s. 0d. (Accepted.)

EALING.—For altering and decorating Grimstone Lawn, Ealing, W. Mr. H. Phelps Drew, 99, Gloucester-road, S.W., architect :—

Bailey, Ealing	£550	0	0
Norton, Chelsea	520	0	0
Rye, Ealing*	480	0	0

* Accepted subject to additions.

FARNBOROUGH.—For alterations and additions to the Cambridge Hotel, Farnborough, Hants. Mr. S. Parker, architect :—

Prestige	£593	0	0
Bishop (accepted)	455	0	0

FAREHAM, HANTS.—For providing heating apparatus in the rebuilt church of St. Peter, Fareham :—

Grundy (accepted) £180 0 0

For gas-fittings throughout the church :—
Shirrell (accepted).

FULHAM.—For the erection of shop at Stamford Bridge, Fulham-road, for Exors. of the late Mr. J. Bowden. Mr. Banyon Tinker, M.S.A., 4, New Inn Chambers, Strand, W. C., architect :—

Smith, W. H....	£2,590	0	0
Stimpson and Co.	2,395	0	0
Prestige and Co, Cambridge Wharf Grosvenor-road, S.W. (accepted)	2,273	0	0

HARLOW, ESSEX.—For alterations to new hall. Mr. C. G. Baker, 5, Bloomsbury-square, W. C., architect :—

Rider, T., and Son £700 0 0

(No competition.)

HOLBORN.—For executing works of sewerage, for the Holborn District Board of Works :—

Killingback, C, Icewell Wharf, Camden Town (accepted) £697.

KIRKBY LONSDALE.—For restoration and reseating of the Congregational Chapel, Kirkby Lonsdale. Mr. R. Walker, Windermere, architect and surveyor :—

Mason's work, walling, and plastering :—Bayliff, W.
Carpenter and joiner :—Hodgson, C.
Plumbing, painting, and glazing :—Moorhouse, J.

KINGSLAND.—For alterations to the Lamb p.h., Kingsland. Messrs. Wilson, Son, and Alwinckle, architects :—

Hearle and Son	£1,297	0	0
Drew and Cadman	1,199	0	0
Shurmur, W.	1,148	0	0
Jarvis and Son	1,140	0	0
Jackson and Todd	1,119	0	0
Mills, J. and H.	1,090	0	0

LIVERPOOL.—For repairs to shops in St. John's Market, Roe-street end, for the corporation :—

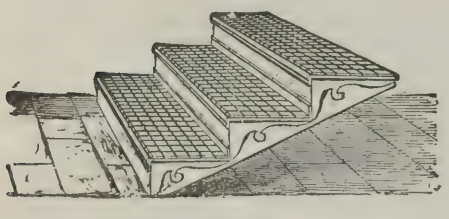
Raffle and Campbell (accepted) ... £48 10 0

LIVERPOOL.—For repairs and painting at the plant-houses, Botanic Gardens, for the corporation :—

Tomkinson, W., and Son (accepted) £157 0 0

LAMBETH.—For the erection of new moulding mills, &c., at York-road, Lambeth. Mr. R. P. Wheelock, architect. Quantities by Mr. H. E. Pollard :—

Mackie, A.	£7,322	0	0
Howard, W., and Co.	6,795	0	0
Longmire and Burge	6,666	0	0
Hosegood, B.	6,325	0	0
Brass, W., and Son	6,282	0	0
Colls and Son...	6,239	0	0
Rider and Son	6,162	0	0
Ansell, C.	6,161	0	0
Howell, E. C, and Son	5,969	0	0
Holloway, J. (accepted)	5,890	0	0



LONDON, S. W.—For partially rebuilding mansions in Cadogan-place, S.W., for Mr. E. J. Barker. Mr. W. M. L. Seaman, Albert Gate Mansions, S.W., architect. Quantities by the architect :—

HAWKSLEYS PATENT TREADS.

Proprietor & Manufacturer: J. WESTWOOD, Jun.

NAPIER YARD, MILLWALL, E.

Telegraphic Address—"Westwood," London. Telephone No. 5065.

Recommended for durability, simplicity, firm footing, elasticity, and are perfectly noiseless; they excel lead, oak, teak, or stone; applicable to wood and iron staircases, new and worn-down stone stairs, spiral and other staircases, footpath flaps to cellars, covers for drains and coal-cellars, flooring for public buildings and aisles of churches, &c., &c.—The best and most durable Tread or Step yet invented.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1712.
FRIDAY, OCTOBER 28, 1887.

AN ARCHITECT'S AUTHORITY.

THE limits of authority of the architect in ordering goods and work for his employer have never been satisfactorily defined by any decision of the Courts. Has an architect power to give an order for a material not specified, or for any variation in the plans without the building-owner's knowledge or permission? The question turns upon whether the architect as an agent to his employer has an express or an implied authority to use his own judgment. One legal authority observes: "As a general agent the architect can bind his principal by all acts within the scope of his employment as against third parties, although the employer may have privately limited his authority." From this statement an architect appears to have an authority to order any material or deviation that he may think fit in the exercise of his function of architect. As far as we can read between the lines or the legal dicta of the Courts, an architect can order anything he thinks necessary, or enter into a contract with a third party to supply materials so long as there exists no doubt as to the *bonâ fide* nature of the transaction and it is not called into question. For instance, an architect may, with the best of intentions in carrying out a building, order an alteration to be made that would not, so far as he can see, add anything to the cost, or substitute stone for brick, and he would be perfectly within his right in exercising this power; of course, on the assumption that his client would sanction or agree to the change. To keep the work as much as possible under his own control, he may enter into a contract with a stone merchant to supply the stonework. We will suppose the employer is a man that does not care to be troubled about these matters, leaving the ways and means to his architect. The work, let us further suppose, costs more than that provided under the first contract and a question has arisen as to payment. The stone merchant, upon the faith of the architect being duly authorised, proceeds to make a claim against the employer. Now, it is very easy for the employer to discredit the transaction and decline to pay, and the architect is placed in the unenviable position of having acted without authority, though, in fact, he was simply doing what he considered he had a right to do as an agent for his client.

The powers of an agent are not very clear, if we take the decisions as a guide. The architect is regarded as a general agent, and, as the authority we have quoted says:—"An agent of this class can bind his employer by all acts within the scope of his employment as against third parties, although the employer may have privately limited his authority." Now, it has been decided that an architect may employ a surveyor to take out quantities. There is an implied authority, ruled by custom, which gives him power to do so; but he is not, by the same rule, permitted to order alterations, or to make contracts on his own authority. In the reported case of "Randall *v.* Trimen," the architect honestly believing that he had authority to order anything for the building, ordered stone for a church, and he was held liable to the builder for the value, whether the representation was fraudulently or *bonâ fide* made. He was also held liable to pay the costs of an action against the client, which had failed, on account of his own misrepresentation. The precedent afforded by this case, at any rate, makes it undesirable for an architect to order materials or extra work without sanction from the owner. The probabilities of such compacts being made by the architect on his own authority, are not favourable to his trusting too much to it.

In building matters it is very uncertain to know when an architect can be said to exceed his authority if he acts within the "scope of his employment." To authorise some deviation that will improve the design without adding to the cost, is surely allowable; but it seems less so if the cost happens to exceed the sum allowed. It appears, indeed, the limit is reached when the order incurs cost. If, from ignorance or neglect of his duties, an architect leads his client into expense or trouble, the case is widely different, and we can understand the law which makes the architect liable for pecuniary injury in such a case, for he is paid for the exercise of skill and diligence. But it is a much harder case to make him responsible for cost necessarily incurred in carrying out his design. But so, too, has the employer a right to be protected from that kind of charlatanism which is common in all professions—that arising, we mean, from improperly prepared designs and plans. In short, the obvious difficulty there is in detecting cost incurred in a *bonâ fide* manner, and that incurred through incompetence or dishonesty, has made the law hard alike upon the honest and fraudulent. The owner cannot always discover whether his adviser is not acting in an illicit manner by entering into transactions opposed to his own interest. An agent cannot legally enter into any such contracts.

Making percentages out of tradesmen and merchants who supply materials or labour is one of the kinds of illicit business into which architects occasionally fall. The thing can be done so easily and so quietly. The manufacturer quotes a price for his work, including the commission, which, under any circumstance, the employer is said to pay for. If the architect refuses, it goes to the contractor. Many of our readers remember the action of the Institute some years ago, when that body drew up a declaration on the practice of sharing commissions. Whether or not it had a salutary effect in checking the evil amongst members of its own body may be very much doubted; the custom of taking commissions lurks in very unsuspected quarters, and indeed is looked upon by many as legitimate business on both sides. Since 1877, when the article on "Illicit Commissions" appeared in the *Westminster Review*, the subject has been allowed to drop—it was a "nine days' talk," the attention of the public was drawn to the practice, and those who dealt in such transactions and had consciences were stricken, no doubt. The transaction is unfortunately too interwoven with the practice of English architects to expect a speedy removal of the grievance. It is necessary to remind the young practitioner that the custom carries its penalties as well as its rewards. If any disagreement arises, the architect is mercilessly tied: he cannot, with any independence, reject work not done according to specification; he is completely handicapped, and his client suffers in two ways—first, in cost; secondly, in regard to the quality of the materials or workmanship over which his agent has lost his right of rejection. These are violations of the faith reposed in the professional adviser or agent; there are other kinds of transactions less gross which ought to be mentioned. Whenever the agent has an interest opposed to his principal the same responsibility is incurred. When, for instance, an architect prepares quantities for a work carried out under his own superintendence, and receives for the same a surveyor's commission or fee, he is practically yielding his authority, and is no longer a free agent. All profits so earned by him belong morally and legally to the employer. The question is one that has been threshed out in these pages, though not exactly in this light. We cannot find fault with an architect supplementing his practice with that of taking out quantities for works other than his own; but when he prepares them for his own, we are of opinion that they should form part of the contract, that the owner should be made aware of the document, and his liabilities in respect thereto. This view of the case is agreeable to the recommendation made in 1872 by a committee of the Institute. Where such is not the case, and the owner is ignorant of the existence of quantities, any excess, deficiency, or error discovered places the architect in a very unsatisfactory, and, in fact, untenable position as an agent of the owner. A set-off may be made; but this is often to the prejudice of the building.

The one question the contractor has a right to know is, Who is to take the responsibility for deficient quantities? When they are supplied by the architect it is generally made a condition that he is not to be held responsible—a very undesirable conclusion, as it only adds to the cost of the work. By making them a part of the contract the objection is rendered less intolerable, and the architect is free from the suspicion that he is acting in two capacities. Lord Grimthorpe advises the employer not to allow quantities to be taken out by anyone who can be made out to be his agent, and this legal opinion is worth consideration.

Other circumstances are likely to arise calling for the exercise of the authority of the architect that may afterwards be questioned. We may here mention the desire of introducing a mode of construction, or some new material about which the architect knows very little. He may, for instance, design a roof truss that fails, or a pillar that is found to be insufficient in strength. Of course, he is liable for the consequences that follow, as his skill and experience have been accepted. The architect runs another risk in these days of advertising and long trade-lists, to which it is necessary he should be on his guard—namely, the responsibility attaching to the specification or employment of any new patent or manufacture. He is not in a position to try experiments at his employer's expense, though there is often a great temptation and inducement to his doing so; his safer course is in declining the responsibility of recommending appliances or materials of which he has not had experience or which are not well known to the profession. The desire to introduce novelties is sometimes too strong to resist; but it is a rather hazardous thing for an architect as agent to undertake the responsibility of anything which is quite new to him, even at the risk of being thought old-fashioned. It is hard to define, again, the responsibility of the architect as distinct from that of the builder. We have no Code Napoléon here by which the obligations of the architect are determined. Broadly he is responsible for all that pertains to the design, while the contractor is responsible for defective materials and execution. Yet it is not very easy to discover which is the most to blame in the case of a defective foundation or the failure of an arch—the builder, or the architect who has neglected the superintendence of the work leading to the result. In France, if an architect has superintended any defective work, he and the builder are both regarded as equally liable, and this rule appears to be a reasonable one from the public point of view. If we look upon the architect's work as indivisible—that is, design and superintendence, he is, no doubt, responsible for any neglect. Extenuating circumstances, however, must be taken into account. It would be absurd and unreasonable to expect an architect to examine every part of a foundation, to see that

a centre was not struck too soon, and to inspect the quality of every stone or brick. An architect's responsibility, in short, is a very ill-defined quality: if it is a correlative with his authority it can be understood; but when accidents and builders' mistakes are included in it there appears to be no limit to its extent.

THE SHOP WINDOW — COMMERCIALLY AND ARCHITECTURALLY.

THE need there is for making the most of of a shop window is calling out the ingenuity of architects engaged in the design of commercial premises. Years ago a very plain and unpretending window for displaying goods was in vogue, and if we go back a century or more we find very little area devoted to glass—perhaps quite as much taken up in mullions and piers. Now, the utmost area is required to give light, and to exhibit as large a number of articles as possible, every available expedient is made use of to increase the glass area. There would appear to be not much to be done in this direction, so long as the shop window was in the same plane as the front wall of the house, and one or two doorways were taken out for access to the premises. The recessed centre doorway between two bay windows projecting beyond the front, and covered by a flat, was an improvement upon the single shop window, as the front sides of each bay gave a larger frontage for display. To both these forms there is the serious architectural objection that there was nothing apparent to carry down the house-front. The iron pillars, painted black or hidden behind draperies, are not apparent, and the whole front wall appears to be without any support except the breastsummer or cornice. The flat, the canted, and the circular bayed windows were alike open to the objection of presenting a large area of glass below a solid masonry façade.

There have lately been a few attempts made to avoid this defective kind of design by carrying down the façade and by recessing the shop windows. One practical difficulty in the way of this arrangement is the great value of area in the shop. A projecting window on the breastsummer system gives space, and if only a few feet or inches of projection covered by a flat can be obtained, so much more room is thrown into the ground floor, besides the thickness of the front wall. On the contrary, upon the new plan, some area must be sacrificed, measured by the depth back of the recessed window and lobbies. All this area must be taken out of the shop floor. The requirements of the Building Act, which makes it compulsory to keep to a building line and to avoid projections, prevents the architect bringing forward his front wall to compensate for the loss of a projecting window. These points have to be carefully considered in the planning of a shop front, and in shallow sites every inch is important. In short, the insuperable objection to giving up any space has been detrimental to good shop design in London and elsewhere. Circumstances are not always, however, so prejudicial. Those who erect commercial premises are not always so cheeseparing as to object to a sacrifice of a foot or two of space, or they have plenty of room. One of the recent examples of a recessed front to a jeweller's shop occurs at the corner of Cecil-street, in the Strand. The house has a narrow frontage to the Strand, and there was little space to throw away. The architect has made the best of the opportunity. The supports to the breastsummer are encased as mahogany pilasters on each front, and these are directly under the fronts. From these the shop windows are splayed back in the form of triangular recesses—that is, the splayed glass windows meet at an angle within the boundary line of front by about 2ft. In the Cecil-street front there are two such recesses with three pilasters, and towards the Strand two pilasters with a rounded corner brought out to the boundary line. The result of the arrangement is that three recesses are thrown open to the pavement for the inspection of passers-by, and a very effective though simple shop window is to be seen. A few square feet are lost internally by the plan; but the advantage gained is that intending customers and others can inspect at their leisure any articles in the windows without being subjected to the movement and hustling of pedestrians. Now, we think that this must be a consideration to every shopkeeper in such a thoroughfare as the Strand. It is impossible to remain even for a moment before any window comfortably without the disturbing feeling of "I must move on" being experienced. With a recessed window, those who come in to look at the shops—and there are many such—ladies especially, a quiet inspection can be made without inconvenience, and certainly to the benefit of the tradesmen. So much, then, for the commercial and utilitarian side of the question. On architectural grounds the case is quite as strong: the façades of the house are brought down to the ground, visibly, and in the perspective view form a kind of screen-like effect to the plate-glass windows within. In the window to which we have alluded the triangular-shaped recesses on the pavement are filled in with mosaic, with the name of the jewellers, "Smith and Son," adding a far better mode of street-advertising than the "facia," which is seldom looked at; they are also ceiled at a moderate height of 7ft., and arched open spandrel pieces are introduced, springing from the pilasters. Above this, the window fronts are straight, and filled with small panes of glass. Economy and light are thus combined, while internally the tops of the triangular recesses can be utilised as shelves. There are other forms of recessing the windows, but which take up more room internally, by throwing the shopfront back entirely free from the external pilasters. A spacious appearance and effective treatment is to make a deep external lobby, the showcases or windows being placed on each side, which permits of external decoration by majolica bricks or faïence appliqué and by mosaic pavements. Many of the large restaurants are now treated in this way. These external lobbies are convenient and certainly inviting. From an architectural point of view, they seem to be the proper mode of emphasising a place of business were they not open to the objection of sacrificing floor area.

The subject is one that must be regarded mainly from the economic point of view. Before tradesmen are willing to sacrifice internal space for external effect, they must be convinced that there are commercial advantages in setting their windows within the lines of front, and that what has been called "politeness" in architecture is more of a reality than they are inclined to believe. To the architect the matter ought to be obvious enough, if he only takes the trouble to recommend the merits of a plan that at once would redeem a street from the appearance of shop-obtrusiveness so offensive to good taste.

OLD CHURCH SIGNS AND MEDIÆVAL BESTIARIES.

CHRISTIAN symbolism ever affords materials for investigation to the ecclesiologist and archæological student, while the diverse opinions held by many who claim to be learned in such matters as to the origin of the more ancient signs used in the early days of the Church invest the subject with an interest peculiarly its own. Mr. J. Romilly Allen, F.S.A.Scot., has just published a work on "The Early Christian Symbolism in Great Britain and Ireland before the Thirteenth Century," the book being an amplification of the Rhind Lectures in Archæology for 1885.* The first of these admirable lectures comprises a classification of the subjects usually represented in symbolic pictures and carvings, and reference is briefly made to the remote systems of symbolism before the dawn of Christianity, as in the phonetic alphabets of the Phœnicians, Greeks, and Romans, or the picture writings familiar in the Egyptian hieroglyphics. The stereotyped modes of thought found among the first converts to the new faith of Christianity largely account for the survival of certain archaic forms, especially in isolated branches of the Church. To properly understand and appreciate Mediæval symbolism it unquestionably is necessary to lay on one side all ideas which are the result of modern culture and endeavour to view things within the limits of the thinker of the Middle Ages, making due allowances for the political as well as religious changes which have so entirely altered the cast of the national mind, and remembering, too, that advances of knowledge have completely revolutionised science and art. Mediæval literature and contemporary manuscripts alone afford reliable interpretation of much which otherwise would be hardly intelligible; while the rudeness of execution of some of the early Christian sculptures has proved a stumbling-block to many inquirers, who have misinterpreted the meaning of the subjects represented entirely by not making sufficient allowance for the want of art training existing in remote places and times. The sources whence the materials for the study of Christian art are generally obtained may thus be enumerated:—A.D. 50 to 400: Mural paintings, sepulchral tablets and sarcophagi from the Catacombs. A.D. 400 to 700: Paintings and mosaics, sarcophagi, carved ivory, coins, and engraved gems in Italy and the East. A.D. 700 to 1050: Ecclesiastical buildings and their parts in Italy and the East; Pre-Norman sculptured crosses in Great Britain; miniatures in Greek, Carlovingian, Lombardic, and Celtic MSS.; belt clasps and Burgundian graves. A.D. 1050 to 1200: Architectural works in Europe and the fittings of churches; stained glass and ecclesiastical furniture and utensils; ivories and miniatures. The rites of religion or burial seem associated with all these sources, particularly those of the earlier epoch. Mr. Allen describes the history of his subject with considerable skill, and devotes to the task a patient industry and zealous love of inquiry. The Romano-British Period occupies his second chapter, wherein Pre-Augustinian Christian remains are illustrated by Celtic monuments and other instances. The oldest authentic examples, perhaps, of Christian symbolism in England are the Chi-Rho monograms from the Roman villas at Frampton in Dorsetshire, discovered in 1794, and Chedworth, in Gloucestershire. There are but very few sepulchral remains and structures belonging to this period which show any trace of Christian symbolism, and the same may be said with regard to the objects discovered in connection with them, such as the following:—A silver bowl found at Corbridge, in Northumberland (now lost), two oval cakes of pewter found in the river at Battersea, and now in the British Museum; a fragment of a metal foot-rule in York Museum; a terra-cotta lamp in the Museum at Newcastle, and a few other specimens. The rude pillar-stones and high crosses of Ireland and Cornwall, dedication stones, and other flat slabs such as those at Clonmacnois, Llan Nnwns, and Tullylease, may be classed among Celtic

* Early Christian Symbolism. By J. Romilly Allen, F.S.A.Scot. London: Whiting and Co., 30, Sardinia-street, W.C. 1887.

TYMPANUM OF DOORWAY OF ELY CATHEDRAL.

IRISH ZODIAC,

With Names of the Apostles and Tribes of Israel, from "Liber S. Isidori," Bâle, Switzerland.

examples, like the Alpha and Omega stones of Gurmarc at Pen Arthur, St. Edrens, and of Hildithryth at Hartlepool. Early erect tombstones and hog-backed recumbent monuments or zoomorphic slabs are next referred to, with some further remarks and descriptions on stone coffins, and representations of men in the ancient attitude of prayer, as at Llanhamllech, Brecknockshire, and at Llanfrynach in the same county. Of the first three centuries of the Christian era no representations of Our Lord's Passion have been found, whereas in later times the Crucifixion is the commonest subject of all, and in this way it is to be noted that each period in the history of Christian art seems to have had its special set of subject and objects upon which the symbolism of the day was employed. The varying wealth and position of the Church, too, in different centuries largely influenced ecclesiastical art necessarily; while, of course, the aptitude of particular races for painting, sculpture, or architectural art likewise must be taken into consideration; as also the revival of literary learning under Charlemagne, for example, should be considered, or the extension of the art of illuminating manuscripts with miniatures illustrating the Scriptures. The period of the sculptured crosses seems to have been chiefly confined to the ninth, tenth, and eleventh centuries, and from those monuments in Great Britain our knowledge of Early Christian art in this country is principally derived. Space fails to allow of our following Mr. Allen through his graphic and detailed descriptions of the high crosses of Ireland, such as those at Clonmacnois, Monasterboice, and Kells, co. Meath; and we can but name the figure-sculptured crosses at Donaghmore, Ardboe, Tynan, Armagh, Clones, Drumcliff, Tuam, Termonfeckin, St. Kieran, Durrow, Kilcullen, Castle Dermot, and Moone Abbey, with others too numerous to mention. Among some very curious representations of the Crucifixion are those on metal plates in the museum of the Royal Irish Academy and in the St. Gall Gospels, or on the sculptured stones found at Kirkholm and at Monifieth, where, on the last-named, King David is playing a harp, a favourite subject in Psalters, especially Irish ones. On the shafts and bases of the Irish crosses, too, among the more popular subjects, are "Daniel in the Lions' Den," the "Flight into Egypt," "Noah's Ark," the "Miracle of the Loaves and Fishes," and the "Baptism of Christ." The stone-roofed oratories of Ireland may be reckoned as old as the seventh century, and are the earliest ecclesiastical buildings in Great Britain; but on these we find no trace of ornamental architectural details or sculpture of any kind. On the round towers of Donoughmore and Antrim, in Ireland, and Brechin, Forfarshire, in Scotland, furnish the first sculptured symbolic details to be noted; but the practice of placing a cross over the doorway of a Christian building may be traced back to the sixth century in Palestine, where the Chi-Rho monogram occurs on the lintels of the doorways of the houses, and over Coptic churches in Egypt (see BUILDING NEWS, April 24, 1884). Of Saxon buildings in this country presenting symbolic carvings of early date the best known are Barnack and Earls Barton, Barton-on-the-Humber, Bradford-on-Avon, Sompting, Deerhurst, and Worth. After these followed the Norman buildings of the 11th and 12th centuries, which period, especially the days of Stephen and Henry I., are characteristic for richly carved architectural details, as at Rochester Cathedral, Caistor Church, Northants; Cormac's Chapel, Cashel, Ireland; Shobdon Church, Herefordshire; Porchester Church, Lincoln Cathedral, Stewkley Church, Bucks; Barton Seagrave, Iffley Church, near Oxford, and Stoke-sub-Hamdon, Parwich, and Hognaston, with other numerous minor churches, or parts of larger ones. The cross in the tympana of old church porches and principal entrances we have already referred to, and the Majesty as well as the Agnus Dei are also among the favourite subjects for this position.

Christ in Glory, inclosed within an aureole or vesica, supported by either angels or the Four Evangelistic emblems, is the highest form of symbolic sculpture, and at this time was common, the finest example, perhaps, being on the tympanum of south door of the nave of Ely Cathedral, herewith illustrated. The cross is introduced, and the book is open instead of being closed, as is more commonly the case; Kirkburn, in Yorkshire, being the only other case known to Mr. Allen wherein the book is represented open. The Last Supper, Christ Washing the Disciples' Feet, the Descent from the Cross, the Delivery of the Keys, the Adoration of the Magi, the Massacre of the Innocents, and other scenes from the life of Our Lord are more or less common, and the descriptions of their representations given in the volume before us are exceedingly entertaining, while the grotesques in illustration of legends often reach the verge of the ridiculous, and sometimes are positively absurd both in sentiment and drawing. St. Margaret and the Dragon on Cotham Font, Yorkshire, and on a capital of a column at Bretforton, Worcestershire, are typical specimens of such caricatures. The seasons, months, and signs of the Zodiac are often symbolised, and the use of the calendar, for marking different parts of the ecclesiastical year and indicating saints' days, accounts for the survival of this practice down to a late period. Agricultural operations are frequently represented on Norman fonts to indicate the four periods of the year, as at Thorpe Salvin, Yorkshire, and "the months" occur at Burnham Deepdale, Norfolk, and the Zodiacal signs at St. Margaret's, Walmgate, York; Brinsop, Herefordshire; and Iffley, Oxfordshire. The system of mystic zoology contained in the Mediæval bestiaries was fully recognised by the Church as a means of conveying religious instruction as far back as the eighth century, and besides this a scheme of animal symbolism, corresponding exactly with that of the MSS., was used for the decoration of ecclesiastical buildings as early as the 12th century, side by side with scenes from Scripture, and such devices as the Agnus Dei. One great difficulty with which the artists who carved the animals had to contend was that they were quite ignorant of the appearance of those from foreign countries; consequently they had to draw upon their own imaginations, or follow written descriptions of the beasts they carved. Thus a tiger is described as a kind of serpent, and is actually drawn as a dragon with wings. A crocodile is represented as a quadruped like a bear, and so on. Some of the animals may

be identified by comparison with those occurring in scenes from Scripture and on the signs of the Zodiac, as follows :—

Ass—Nativity : Flight into Egypt : Entry into Jerusalem.
Basilisk—Christ treading on.
Bear—and Children who Mocked Elisha : Slain by David.
Beasts—named by Adam : going into the Ark.
Bull—Symbol of St. Luke : sign of Zodiac.
Calf—of gold ; the Wilderness : symbol of St. Luke.
Camel—Rebekah at the Well ; Joseph sold to the Ishmaelites.
Cock—St. Peter Denying Christ.
Dove—leaving the Ark : (Holy Spirit).
Dragon—St. Michael and ; Christ treading on : of the Apocalypse : (Hell).
Eagle—Symbol of St. John.
Fish — Miracle of Loaves and Fishes : sign of Zodiac : Miraculous Draught of.
Goat—Sign of Zodiac : (The Damned).
Horse—Passage of Red Sea : Ascent of Elijah : of the Apocalypse.
Lamb—Agnus Dei.
Lion.—Samson and : David and : Daniel and : symbol of St. Mark : sign of Zodiac : Christ treading on : of the Tribe of Judah : opening of the Book with the Seven Seals in the Apocalypse.
Ox—Nativity.
Ram—Sacrifice of Isaac : sign of the Zodiac.
Serpent—Temptation of Adam and Eve : Christ treading on.
Sheep—Shepherds and Flock : Nativity : David and his flock.
Swine—Miracle of Healing the Demoniac.
Turtle Doves—Presentation in the Temple.

We print an Irish Zodiac with the names of the Twelve Apostles and the Tribes of Judah from the *Liber S. Isidori* in the Library at Bâle, Switzerland. To those interested in Christian symbolism Mr. Romilly Allen's book will furnish much valuable information, concisely put and ably classified for reference. The illustrations, too, are carefully chosen, while the volume is admirably printed and produced.

ST. JAMES'S PALACE, ITS PRESENT AND PAST.

A ROYAL Palace, wherever found, and of whatever date, may be confidently considered to contain all that is possible and desirable in the matter of house building and decoration that the age in which it is contained and built is capable. All things go to aid in this, and it may be affirmed with confidence that a house so built must needs be expressive to the full of the house building capacity of the day in which it is built and dedicated to its high purpose. Windsor Castle, St. James's Palace, Buckingham Palace, must all afford proofs of this capacity and careful thought and power of house designing and building. It is surely a subject of no small interest to the architect, the builder, and the art-workman, everywhere and always ; but now the more particularly and especially that the public have been privileged to wander through the stately rooms of St. James's Palace, of which so few hitherto have seen aught but the dull exterior. It has suffered since its first building from not a few "alterations and improvements," but yet retains so much of its original character as to be fairly expressive of the time and artistic way of thought of its contrivers and builders. It was at one time, as the guide-book tells us, of "unmixed Gothic," characteristic of the age of Henry VIII., improved by Charles I. and "sadly deformed" by Charles II. and William III., and, moreover, all that has been done since to it has but tended to destroy its original architectural character as a royal residence. But, as we say, it is a royal house yet, and no one looking from its stately and quiet rooms into the park and gardens can think otherwise. At the time of its first building it was called the King's Manor of St. James, and was then inclosed and planted, the King using it occasionally for a residence, though keeping his Court at Westminster. It may seem to many a somewhat dull abode, but it is full of "memories" quaint enough, and taking the mind away from the ever present of things ; for at the time when Lord Burlington built his mansion in Piccadilly, of about the same date, he gave for a good reason of it that "no one could build beyond him," thus to blot out his view of the open country. It was, too, according to Lord Chancellor Clarendon, a fair house of entertainment, whereto the "privileged" met for "exercise and conversation." The tapestry hangings, it may be noted, in some of the larger rooms came from the looms at Mortlake, and are of the times of James I. and Charles I., and with the other furniture of the rooms, from the offices of the Throne Room itself, offer every here and there, with the rooms themselves, objects of interest and instruction, not alone to the house or palace furnisher, but to the architect who builds for the like purpose. But in common with older and yet more venerable structures St. James's Palace has suffered not a little from alterations. It was, says the guide-book, once on a time of "mixed Gothic," characteristic of the age of Henry VIII. This was "improved" by Charles I. and afterwards "sadly defaced" by Charles II. and William III., and all since then done has but tended to destroy its original character. It is curious to note that it is built on the site of a hospital which originally stood there before the Conquest and dedicated to St. "James." In 1100 this was pulled down and rebuilt by Henry III. Thos. Cromwell gave the "design" for the present building ; it was then called the King's Manor of St. James's. It may be noted here, too, that the present park, in which it stands, was then but a marsh ; but when the Palace was built the whole site was drained, inclosed, and planted, the King using the building only occasionally for a residence, he keeping his Court at Westminster. It is to be observed that at the date of the building of the Palace—St. James's—that extended to the open country, and that from its entrance gateway this was to be seen. By comparing a map of to-day with one of the beginning of the century, a clear idea enough idea of what has been done since the Palace was built can be well realised. The chapel here, it may be noted in passing, was designed by Inigo Jones, and goes by the name of the Queen's Chapel. Much more might be made note of, but our object is simply here, in thus calling attention to it, to urge on those who have the charge of it, to make so historic a place more often available for public inspection and instruction, much as there is here that is out of all harmony with the building itself and its associations and memories. St. James's Palace is certainly, in its own way, as instructive a monument, historically and locally, and in its special way, as Windsor itself, and might, indeed, be made yet more so by a little thoughtful looking to.

We have thus glanced but for a moment at this Royal Palace, in the hope that a little attention architecturally may be accorded to it, and it and its "furniture" harmonised. It would be difficult, indeed, to find a subject matter connected with architecture and house building, and decoration in its fine art sense, of more interest and fuller of instruction than as now seen in our various Royal Palaces, which may fairly be said to comprehend all that has or can be as yet thought about and practically realised in the progressive art of house building, and decoration, and furnishing. Here, if anywhere, there is no question of cost ; all is done that may be thought needful, and both the materials used and the workmanship must needs be of the best and of the most advanced and improved kind, and that this is so will be evident to all who look about them, even as casual visitors, with sufficient attention. But with all there is, it is to be feared, a sad enough lack of what may be termed *high art* effort, or even attempts at it. Surely the very walls of a Royal Palace should evidence the designing head and manipulative skill of the artist-workman. But it is not so, for the wall papering is but of the ordinary type of such work, though costly, and the "design" on it, covering so large a space, not a little incongruous and out of place. Very much might without doubt here be done, and but at a trifling cost, thus to make of St. James's Royal Palace a connecting link, architecturally looked at, between the Gothic and Renaissance of the past and the work of the ever present, thus reading to us a most useful and instructive lesson. C. B. A.

THE ARCHITECTURAL ASSOCIATION.

THE opening meeting of the new session of the Architectural Association was held on Friday evening. The change of meeting place made from the Architectural Union Co.'s western gallery in the basement of No. 9, Conduit-street, to the large hall of the R.I.B.A. on the first floor, was amply justified, for the room was crowded, and the proceedings were characterised by animation and enthusiasm. The President, Mr. John Slater, B.A., F.R.I.B.A., occupied the chair. Over forty nominations for membership having been read, Mr. William Emerson, who was a member previously to his leaving London for Bombay, was re-elected unanimously and by acclamation. A letter was read from Mr. E. Guy Dawber, resigning his place as a member of the committee. It was stated that the committee had nominated for the vacancy Mr. P. J. Martin, whose name stood highest of the unsuccessful candidates at the annual meeting, while Mr. W. J. H. Leverton had been nominated by Messrs. A. O. Collard and Max Clarke. The election will take place at the next fortnightly meeting of the Association. A vote of thanks was, on the motion of Mr. T. E. Pryce, hon. sec., accorded to all who assisted to make the recent conversazione a success. Mr. Pryce also announced that the first meeting of the class of design will be held on Tuesday, the 15th of November, and not on the preceding Friday, as originally advertised.

The balance-sheet and report were formally adopted, on the motion of Messrs. H. W. Pratt and H. D. Appleton ; and a vote of thanks was accorded to the auditors, Messrs. Bulmer Booth and F. E. Eales.

The President, having distributed the prizes in accordance with the list published in our columns (p. 574) on the 14th inst., delivered his

INAUGURAL ADDRESS.

After some preliminary observations, Mr. Slater remarked that when an association or society is approaching the fiftieth year of its existence, and numbers on its roll nearly 1,000 members, no one can call in question its complete success, for its position speaks for itself and is beyond cavil. But in this very success lurks an element of danger which, unless carefully guarded against, may threaten the stability of the fabric which has been so carefully reared. This danger is twofold : on the one hand, there is the tendency to point to what has been done and to ignore the ever-changing conditions of the times, and consequently to crystallise ; on the other hand, is the tendency to ignore the past and to rush eagerly and impetuously along new paths without carefully studying the direction which those paths take. We may, he added, guard against this double danger in the case of the Association by occasionally reviewing its history and ascertaining what were the aims and objects of its founders, by seeing how these aims have been varied with the growing requirements of the times, and how in the present day they still require modification. The records of the early years of the Association are most meagre ; but it is a well-authenticated fact that it developed from the Society of Architectural Draughtsmen, which was founded in 1842 by a small band of earnest workers. The objects of this society were threefold : 1. To assist the mem-

bers in obtaining employment. 2. To foster good draughtsmanship, by making it a rule that every member should furnish quarterly a drawing of some executed architectural subject. 3. The establishment of a benefit fund upon which the members could draw in the event of sickness. It would have been a wise thing if the Association could have retained as part of its functions this last object in some form or other. On February 3rd, 1847, a most important and, as the Germans would say, epoch-making paper was read by Professor —then Mr.—Kerr, in which he sketched the outline of an architectural association of students for mutual instruction and improvement. The result of this paper was the establishment of the Architectural Association, which held its first conversazione in Lyon's Inn Hall, on October 8th, 1847, the report of which says that "it was held under very promising circumstances, more than 100 gentlemen being present." In November, 1847, it numbered eighty members. The objects of the Association were stated to be—(1) the development of true principles of criticism in architecture; (2) the advancement of the study of design; (3) the provision of means whereby the student may acquire an aptitude for applying and extending the present materials of the art. The President proceeded to sketch the history of the Association, pointing out that in 1856 it was proposed to dissolve it, there having been much friction between the Association and the Institute. A proposal to amalgamate with the latter body was also rejected; but in 1859 the meeting-place was removed from Lyon's Inn Hall to Conduit-street. In the following year the condition of the Association was again declared to be critical; but measures were taken to increase its efficiency; new classes were formed, a lending library was established, and from that time to the present, with slight vicissitudes, it has gone on increasing its numbers and widening its sphere of action until it has become a large and powerful body. What is the reason that, after completing its tenth year, on two occasions within five years thoughts of closing the operation of the Association were seriously entertained? Fifty years ago design and draughtsmanship were considered almost the sole essentials for an architect. Design was the main object of the Association. The whole scope and objects of the Association were too narrow and were kept too rigidly to the original lines. It was by widening the range of study, by the institution of such classes as those for preparation for the voluntary examination of the Institute, by leaving the old tracks and by entering upon new courses, that failure was averted and success assured. May I venture, most respectfully but most earnestly, to beg some of those old and honoured members of the Architectural Association who sometimes think that we are venturing upon risky experiments to bear in mind the words of the American poet, who says:—

"New occasions bring new duties,
Time makes old things seem uncouth;
They must aye be pressing onward
Who would keep abreast of truth":

and by truth I mean the growing requirements of the time. I do not ignore the opposite danger to which I alluded, that of going too fast and too far in new directions; but there will always be a preponderating inclination towards following precedent rather than departing from it. To turn now from the historic to the more immediate past, it is my pleasant lot to congratulate the members upon a most prosperous session; the meetings have been well attended, the classes have been more numerous than ever before, and the work done has been of a very high order of merit. I must specially mention the masonry class, which Mr. Lawrence Harvey kindly conducted gratuitously, and Mr. Quick's lectures on "Graphic Statics" may also be strongly recommended to the more advanced students. The lectures will be continued on slightly different lines from those of the past session. Mr. Tarver gives up the history lectures, but other short courses will be given by Mr. Sedding and Mr. Stannus, the latter gentleman taking the Classic and Continental styles, and Mr. Sedding confining himself to English architecture. Mr. Lovegrove will continue his excellent course of lectures on construction. By the liberality of extraneous donors, the list of prizes that can be obtained by students has been much enlarged. This is a matter for congratulation. Possibly in an ideal community work would always be pursued for its own sake; but ninety-nine persons out of a hundred work better if they have a goal to aim for, and the healthy stimulus of friendly rivalry for a prize is productive of great good. But this friendly emulation is a very different thing from pot-hunting, which should be guarded against most rigidly. With reference to these prizes, I would specially call attention to the foreign travelling studentship which Mr. Aldwinckle's liberality has thrown open to the members of the Association, the regulations for which have been slightly modified. In reviewing the past session I must not overlook one very pleasing event—viz., the appointment of an old President of the Association, Mr. Blashill, who has shown the great interest which he still retains in its work in the most practical way by founding a studentship, to the important post of Superintending Architect of the Metropolitan Board of Works. To another member of the Association, Mr. Collcutt, has been awarded the high honour of the difficult task of carrying out the important buildings of the Imperial Institute, and it is worthy of remark that of the six gentlemen who were selected to compete for this work four are members of the Association. A word of notice is due to the establishment of the "A. A. Notes," under the editorship of one of the most hardworking, versatile, and efficient officers the Association has ever had, Mr. H. D. Appleton. One of the salient features of the last few years' history of the Association has been the increase of the *entente cordiale* between us and the Royal Institute of British Architects, the outward and visible sign of which is that we are holding our meeting in this room. I propose to examine this closer connection between these two bodies somewhat in detail, because I am most anxious that there should be no misunderstanding among the members of this Association as to its meaning. Now, there is not a single member of your committee who is not convinced that anything tending to diminish the independence and freedom of action of this body, anything likely to make the Association an appanage or dependency upon any larger body, would be to sign the death-warrant of the Architectural Association. I am one of the strongest advocates for making the connection between the two bodies as close and intimate as possible; but I am a stronger opponent of anything approaching amalgamation. Each body has work to do which cannot be done by the other; but each can give the other material and valuable assistance. At the same time, it should be the earnest endeavour of the two bodies to work together for the advancement of education, the furtherance of art, and the general well-being of our noble profession. The proud motto of the Institute, "Usui civium decori urbium," can only be realised by following the motto of this Association, "Design with beauty, build in truth." What the precise form of relationship between this Association and the Institute will be when the latter gets into work under its new Charter and By-laws is not quite clear; but it seems to me that it should be something like that existing between the University and its colleges. These all manage their own affairs entirely and provide for their students the means of obtaining instruction; but the University, by the establishment of degrees and shaping the examinations, and by grants for lectureships, exercises considerable influence upon the curriculum, and always avails itself of the advice and co-operation of the executive of the colleges. Of course, the analogy is not complete, as a University has to do exclusively with teaching, whereas a society like the Institute has much to do with practice as well as with education. But the examination which was set on foot by the Institute has shown most clearly that architectural training and education are the subjects which emphatically require attention. The difficulty of providing adequate means of acquiring professional knowledge for the young men who are coming into the profession every year in shoals is almost appalling in its magnitude. I do not ignore the existing means, but when you take the average yearly number of students at all the various institutions and classes for the past few years, and compare it with the number who enter this Association, it is perfectly evident that the educational forces do not reach one tithe of those who are preparing themselves for architectural practice. In this matter of education the Association has for some time been well in the van. But the question arises whether its voluntary work is adequate and whether it is the best. Is there any reason why it should not be supplemented by more extended educational work of a higher kind, and which cannot be obtained gratis? I confess I can see nothing derogatory to this Association in accepting grants for lectureships supposing funds were available from the Institute, for I believe that the limit has been very nearly reached of the voluntary work of the Association. It has been pertinently asked what provision does the Association make for preparing its members for the Institute examination, and sweeping reforms in the methods of imparting instruction have been suggested. It is not a complicated arithmetrical problem to ascertain what 1,000 half-guineas amount to, and a glance at the revenue account will show what balance the Association has, after paying the absolutely necessary outgoings, for increasing its usefulness in this way. I think the suggestions alluded to worthy of serious attention. The committee would willingly do more to assist with the preparation of candidates for the Institute examination if they could, but I fear they have got to the end of their tether. And, after all, the question forces itself upon my mind, Do we get the best work of one individual in a thousand if it is given voluntarily? Some people consider the Institute examination a success, others vote it a failure. But no two opinions exist as to the immense amount of good which has been already done by its establishment. I believe every candidate, whether successful or otherwise, will tell you that the mere preparation for the examination has done much to widen his horizon and to increase his interest in everything connected with his professional work. I am not saying that either the general scheme or the details of the examination are perfect, because I believe both require modification, and I hope to see improvements made in it before another year has expired; but passing the Institute examination, and the subsequent if not the consequent Associateship, should be considered as essential a part of the training of an architect as being articled or learning to design. I should like to endorse the recommendation of Mr. I'Anson that the examination should be recognised by a clause in the indentures of every articled pupil. And this applies not only to London, but to the provinces also. I should strongly advocate increasing the number of provincial centres of examination, even though the candidates were very few at first, and I see no reason why, supposing funds were available, the Association should not assist in this work. We have for a long time had one country branch affiliated to ourselves, and I do not think it would be difficult to devise a scheme whereby other provincial societies might enter into relations with us, somewhat on the lines of affiliation, to the mutual advantage both of them and of ourselves; in fact, I think it quite possible that this Association may turn out to be the medium for bringing about that consolidation of all branches of the profession which is aimed at by the various suggestions for federation which have been so much discussed during the last twelve months. There is, however, one warning which the student should ever bear in mind in reference to the examination. Look at it not as an end, but as a means; not as the climax of your studies, but as an incentive to fresh ones; and if you take this view of it there will be no fear of its becoming anything but an unmixed good. We may, however, go on improving the facilities for architectural education in vain unless the absolute necessity of a thorough and first-rate general education for an architect is fully recognised. Many lads are articled to an architect at the age, say, of sixteen or less, and are expected, after three years, to be able to earn their own living. Such a system as this is not only unwise and ineffective, but is extravagant, and it will pay better in actual pounds, shillings, and pence to keep a boy at school for another two years and then give him a course at a technical college or at one of the universities before he is articled to an architect. Just look at what is required of an architect

nowadays. And yet, though many things are required of him by the public, will anyone say that in very many cases the public recognition of an architect's services and position is all what he ought to expect if he be a capable man? But let us bear this in mind, that the recognition of our profession depends upon each individual one of us. The outward display which is so striking a feature of our times has affected the architect, and is seen not only in the palatial exteriors which mark some of our new buildings, but also in the excessive elaboration of modern draughtsmanship. It is not so much elegance of drawing as knowledge of details that is required in practical work; comfort and substantiality in the erected building will be more appreciated by the client than the appearance of the plan and elevations on paper; so that while not neglecting draughtsmanship—don't imagine that I am disparaging that—try and make it only a means of assuring more accurate knowledge. We have responsibility not only to our clients but to a ourselves and our colleagues, and a delinquency on our part, a lapse from the high standard which we should set up for ourselves, or even only a manifest display of incompetency in work which is intrusted to us, may do far-reaching harm and is a slight upon the other members of our profession. We should bear in mind, as Bacon says, that we have "as well to create good precedents as to follow them," and although we cannot all be a Michel Angelo or a Brunelleschi, and hand our names down to posterity "in records that defy the tooth of time," we can all earnestly endeavour to do thoroughly and well the work that comes immediately to our hand; and if this spirit animates us, whether as students in our preparation or as principals in our practice, we shall do what lies in our power to uphold the dignity of our profession, and to hand on the Lamp of Architecture with its lustre undimmed to those who are to come after us.

On the motion of Professor Kerr, seconded by Professor Roger Smith, and supported by Messrs. T. R. Rickman, E. C. Robins, and J. Douglass Mathews, a cordial vote of thanks was accorded the President for his address.

MASONRY AND STONE-CUTTING.*

By Lawrence Harvey.†

FIRST LESSON.

THE art of masonry comprises the solution of two questions:—

Firstly. Which are the shape and the dimensions a stone structure should have to insure its stability, and to satisfy the requirements of taste and convenience?

Secondly. The shape and dimensions of a structure having been determined beforehand, how to produce the structure out of an aggregate number of blocks of stone of moderate size and of such shape that, placed side by side in a given order, they will support one another as if the whole structure consisted of one single stone?

The first question depends on the laws of statics, on the toughness of the stone used, on the artistic rules of architecture. This is, therefore, a vast subject of study, which includes nearly all the science of construction and the history of architecture. For this reason we do not intend to treat this part of our subject, but will confine ourselves to the second question only—viz., the scientific operations of stone-cutting, or the methods by which the mason obtains, from the designs of the architect, the exact shape of each stone in a building, so that when set in its place it shall exactly fit the adjacent stones without previous reference to them.

THE SCIENTIFIC OPERATIONS OF STONE-CUTTING.

The masonry of walls and trabeated architecture is of so simple a character that it offers no interesting geometrical operations, and we beg to begin at once by studying the construction of vaults.

The scientific operations of stone-cutting then comprise three problems:

Firstly. To find the most advantageous system of voussoirs to subdivide a given vault.

Secondly. To determine the arrises and the true shape and dimensions of every face of the voussoirs. The limits of these faces are of course the intersections of the divers surfaces given by the former operation.

Thirdly. To apply the lines found to the working the stone, so that the stone be cut to the shape given by the working drawings.

The first of these operations, or the system of the division in voussoirs, differs according to the shape of every vault; but there is one general rule which must be followed as much as possible—viz., *the joints* (that is, the faces of the voussoirs which come into contact with one another) must be made *normal* to the *intrados* of the vault (that is, must be in every point made perpendicular to a plane tangent in that point to the inner surface of the vault). It is evident that, if this condition be not fulfilled, of two contiguous voussoirs the one would present an acute angle, the other an obtuse angle, and the first would inevitably be broken off by the pressure of the latter, and thus disfigure the inner surface of the vault. This might even sometimes endanger the stability of the structure.

To carry out the second operation, the intended vault has to be delineated, full-size, on a platform prepared for that purpose. The utmost accuracy is required in making these full-size drawings; the method and means for producing them are fully explained in Mr. Dobson's *very short* treatise of masonry, to which we beg to refer our readers. This done, the arrises which form the outline of every face of each voussoir, are determined in projection; then the stonemason gets the real size and shape of these faces by the methods usual in practical geometry. He turns down the faces which are plane, and he develops such faces as are developable: by these means the moulds, templets, and bevels required for working the stone are obtained.

So as to clearly understand the terms we shall employ hereafter we beg to give a few definitions, some of which refer only to the words we use in this paper.

Each one of the stones, which compose either an archway or a vault, is called a *voussoir*.

In each voussoir the *soffit* is the face which forms part of the interior surface of the archway or vault; the *bed-joints*, or *beds*, are the faces *M m*, *N n* (Fig. 1) on which the voussoirs of one course bear upon the voussoirs of the course immediately below them, whereas simply the *joints* are the faces in which two voussoirs of the same course come into contact. The *head* of a voussoir is the name we shall give to the face thereof which appears on the front wall or face of an archway. We shall also, for convenience sake, use the words "back" and "top" for the faces of the voussoir which come in contact with the masonry of the wall supported by an archway or a vault.

In a vault the interior surface is called the *intrados*, but more commonly the *soffit*; and the exterior surface (Fig. 1) is the *extrados*, when such a finish exists. When the vault is comprised in a body of masonry, as in an archway pierced through a wall (Fig. 2) there is no real extrados, but the backs of the voussoirs are cut to fit in with the horizontal courses of the stone wall; the name of "extrados" is then given to an ideal surface, shown by dotted line, which would connect the extremities *a*, *b*, *c*, *d* of the bed-joints of each voussoir. The *jambs* are the sides of an aperture or an archway; but the more general term of *piers* will be given to whatever structure, wall, pillar, or pilaster supports a vault. The *springing line* is the lowest level where the vault begins, and we shall call the *springer* the lowest voussoir next the springing line. In segmental vaults and flat arches we shall give the name of *abutment* to the highest stone of the jamb, because it resists the lateral pressure of the vault; but in semicircular vaults and others, which simply rest on their piers, we shall call *impost* the stone immediately below the springing line.

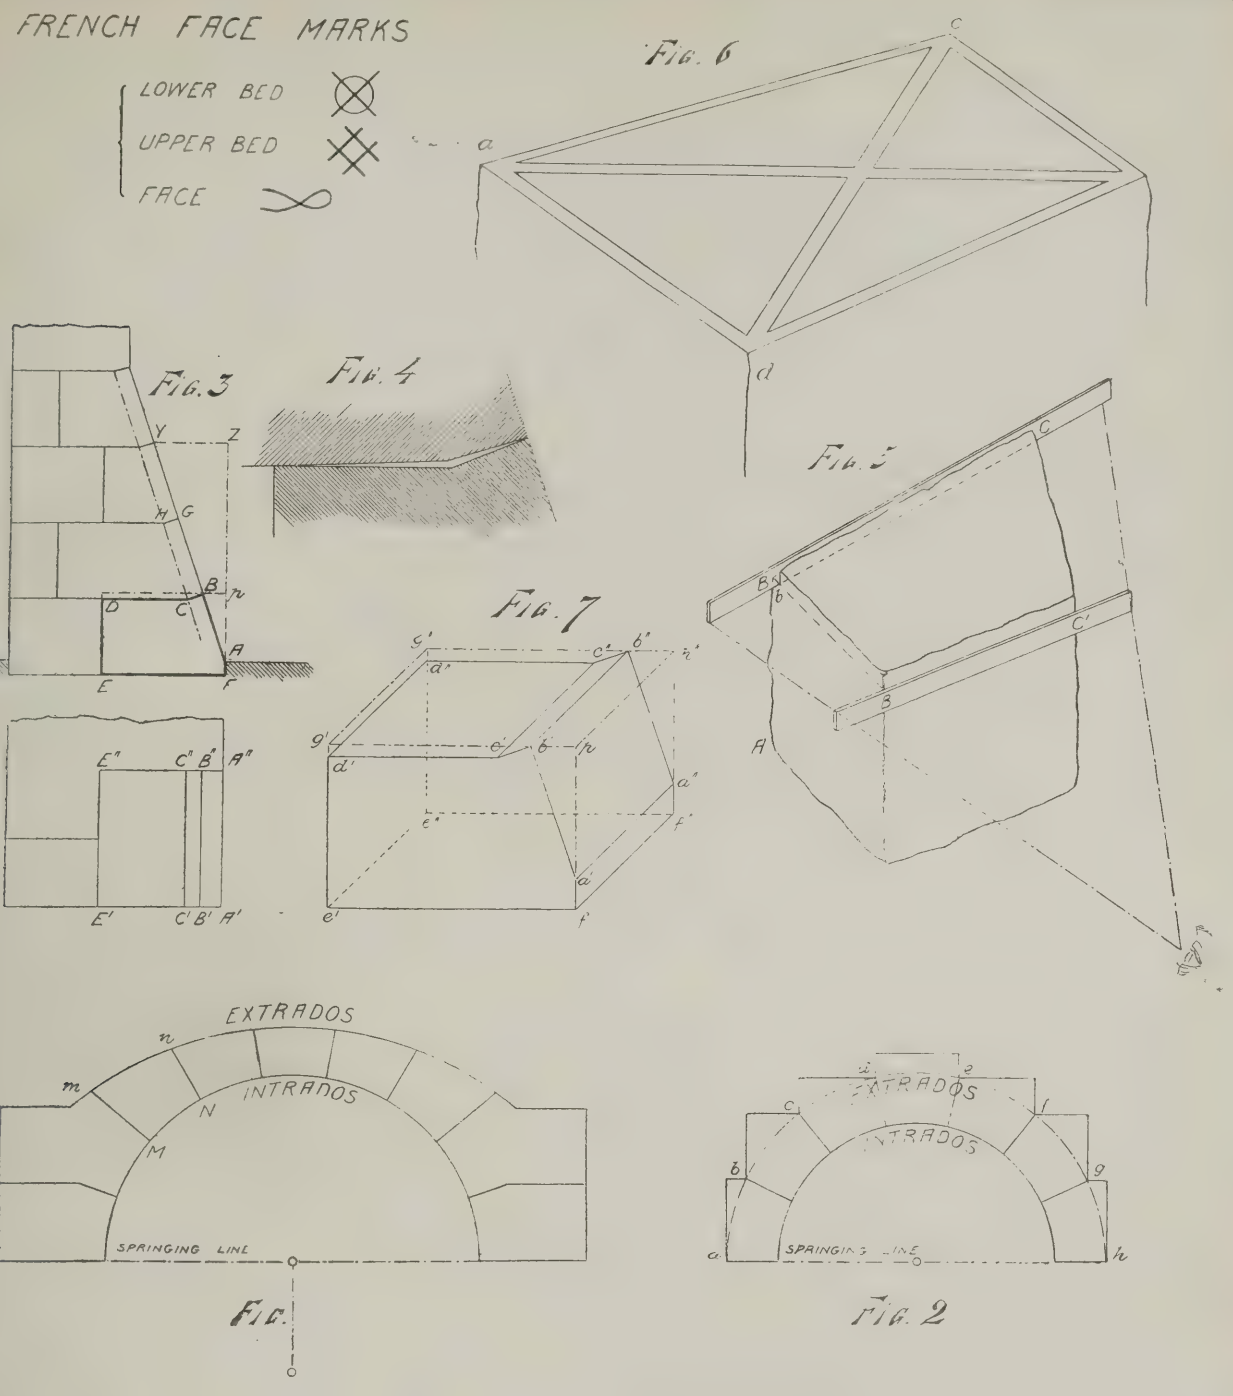
All rocks are either *sedimentary* or *igneous*. Limestones and sandstones belong to the former, granites to the latter. In quarries of sedimentary stones the strata are generally separated by parallel surfaces; and in extracting the stone, rough pieces are obtained in which the quarry-beds are nearly plane faces. Whenever stone is employed in building, it is important to keep the quarry-beds perpendicular to the direction of the pressure the stones will have to sustain, because the resistance of the stones is in that direction at its greatest to meet the crushing weight to which it is submitted. In a wall, for instance, the quarry-beds should be horizontal; in a vault, the quarry-beds must either coincide with one of the bed-joints of the voussoirs, or form equal angles with both their bed-joints. The reverse holds good when the stones are submitted to flexion, as in architraves. In that case, the stone offers a much greater resistance when its quarry-beds are placed vertically, as was practised by Greek, Roman, and Mediæval masons.

The foreman of stone-cutters makes out the full-size geometrical drawings required, and directs the workmen in applying the results of his drawing, moulds, templets, and bevels to the cutting of the stones. He also marks out each stone, when cut, with certain signs or face marks (in Fig. 8 we give the signs used by the French masons), so that the foreman who directs the laying of the stone may know which are the lower and the upper bed-joints. The face marks are not to be confounded with the ordinary marks which masons use in lieu of signature.

BATTERING-WALL.

To explain the operations of stone-cutting more easily, we have taken for our first example a simple battering-wall, which offers no complex arrangements of masonry whatever. A wall is said to be *battering*, or on the batter, when its face is not vertical (Fig. 3). The angle of the batter is measured from the plumb-line; for instance, in Fig. 3 the batter is the angle Y A Z. This angle is not usually given in degrees, but by the proportion between Y Z and A Z, such as 1ft. in two, or 3in. to the foot, &c. In our drawing, we make the batter of 4in. to 1ft. rise, or one-third.

If (Fig. 3) the horizontal bed-joints were carried through to the battering face of the wall, the lower arrises of the stones would be sharp, the upper ones obtuse. To avoid this defect, the horizontal bed-joints are stopped at a distance of 2in. or 3in. from the battering face, and the ends of the joints are made perpendicular to the face of the wall, as in B C and G H.



As we have said before, sharp angles should be avoided, yet there are cases where the treatment necessary to obtain right angles is nearly as objectionable as sharp angles. In Fig. 3, for instance, the lower bed-joint of each stone presents a projecting angle which has to fit exactly in the inner angle of the stone below it; such joints are rarely perfect, so that the stone most often will bear on a few points, as in Fig. 4, instead of bearing on the entire surface of the bed-joint. In this case, the mason should allow for a wide joint on the face of the wall, to prevent the stones bearing on the outer edge of the bed-joints, the joints to be filled up with cement after the work is completed. The architect will avoid giving the mason these difficulties, if he will adopt a V-jointed rustication instead of a wall with a plane face, and this will, of course, be a more economical design to carry out than the former.

Before explaining the operations for cutting the stones of a wall, we must begin to show how a plane surface is worked on rough stones such as are extracted from quarries.

(Fig. 5). The blocks of stone extracted from quarries are in the shape of rough prisms. If they be of moderate size, the workman can proceed, as shown in Fig. 5. On the back face, A B C, and close to the upper edge, he will draw with the help of a straight-edge a line B C. This line will not be straight on account of the irregular surface of the rough stone, but it will be contained in a plane. Then with the chisel and mallet, a draft or narrow ledge is cut along

* All rights reserved.

† As many readers know, this subject—of which there is no English textbook in existence—is now in a fair way to receive the attention it deserves. The City Guilds Institute is taking the matter up, and the Institute of British Architects will probably move one of these days in the same direction. A series of classes for the use of architectural students to enable them to obtain, by the means of masonry, a thorough knowledge of the geometrical operations which find constant application both in architectural drawing and construction, is now being held at the City Guilds Institute, South Kensington, on Monday evenings, from 7.30 to 10, commencing on Monday, October 17th, 1887. The series is divided into three courses of ten lessons each. We have availed ourselves of Mr. Harvey's assistance to place the notes and diagrams of these lectures before our readers, convinced that they cannot fail to benefit students generally.—Ed. B.N.]

that line, the depth B b of this draft to be about $\frac{3}{4}$in. and to be accurately worked to a plane. This done, the workman places his straight-edge upright on the ledge of the draft he has made; he will then place against the opposite face of the stone another straight-edge, so that its upper edge coincides exactly with the lower edge of the first straight-edge, when sighted from a distance. He will then cut another chisel draft along the line B′C′ marked by the second straight-edge. These two chisel drafts are of course in the same plane, and the workman has only to remove the superfluous stone which divides them, until the surface coincides in every part with a straight-edge. This he does by connecting the two first drafts by a draft B B′, and following on cutting away the stone so that a straight-edge resting on the two opposite drafts should touch the whole intervening surface.

To form a plane surface, when the surface is of considerable size, two diagonal drafts as $a\,b$, $c\,d$ (Fig. 6) are produced across the surface, and connected by cross drafts, as $a\,d$, $c\,b$. The superfluous stone is then knocked off between the drafts.

In working a block of stone, the workman begins by bringing to a plane surface one of its largest sides, usually one of the beds. Without any further explanation, the reader will easily conceive how another face, perpendicular to the first, can be produced by sinking across its ends chisel drafts with the help of a square, then working this second face between the drafts.

(Fig. 3, 7.) Now, let us see how we will work the lower stone of the wall (Fig. 3). The elevation of this stone is shown (Fig. 3) by the outline A B C D E F, and its plan placed below the elevation is contained within the rectangle A′ A″ E″ E′. *

A stone will have to be selected from the quarry, the base of which will be equal to the plan A′ A″ E″ E′, and the height of which will be equal to F p; but all the surfaces of this stone need not be worked, for, as some of them will have to be cut away, this would entail a waste of labour. The workman (Fig. 7) will begin by forming the lower face of the stone which is to become the bed-joint of the same. He will draw thereon the rectangle $f'\,f''\,e''\,e'$ exactly equal to the plan of the stone; he will then work the face $f'\,e'\,q'\,p'$, which is perpendicular to the bed-joint. This done, he will draw on that face the outline $a'\,b'\,c'\,d'\,e'\,f'$ identical to the elevation of the stone. After this by the help of a square, the workman can cut all the faces of the stone perpendicular to the face last worked. He will finish the stone by measuring on the last-worked faces a distance equal to A′ A″, which will give him the arrises of the end face, which he will then be able to cut.

This method for cutting the stone would answer; but in our opinion, it would be safer to begin by also dressing the back plane, $f''\,e''\,q''\,p''$, and marking thereon the outline of the elevation. In that case, the other faces can be worked with a straight-edge guided by the arrises of the outline. When, as in a wall, many stones have to be similarly worked, a mould cut out by the foreman to the shape of the elevation is generally used.

Of course, the method indicated for cutting the stones of the lower course applies equally to the stones of the courses above. The geometrical operations required to obtain a stone of a given shape out of a rough block are simple enough; but we beg to point out that much judgment is required to cut out the stones so

* Observe that two points or more may be projected in elevation on one point only, for instance, the points A′ A″ on plan have both for elevation the point A. Likewise two points in elevation A and F may have for plans only one point A′. Thus a point is only completely defined when both its projections are named, such as point (A, A′) or point (F, A″); but for shortness sake we will often be content with defining a point by its sign on the plan, and call it the point A′ or E″, thereby meaning the point itself in space.

as to waste as little material as possible, and a good foreman of masons can save his employer large sums of money.

ARCH CONSTRUCTION.

IRON construction has so completely superseded masonry for bridge-building that it would appear almost unnecessary to discuss the question of the equilibrated arch for any large span. But the mathematical principles of the arch have always been an interesting subject with geometricians and theorists, and the theory, at any rate, ought to form one of the subjects of the architect's and engineer's education. As a problem of the equilibrium of forces, the theory of arch construction is instructive, inasmuch as it presents us with a concrete example of three forces balanced in a structure. The other day, at the opening of the Engineering section of the Bristol Naturalists' Society, at University College, Bristol, the president, Mr. Charles Richardson, C.E., read a paper on Arch Building, in which he advocated the employment of arches of equilibrium for bridges. The author referred to the well-known and elegant property of the balanced arch, which is derived from the principle of the catenary or suspended chain or inverted polygon of bars, each bar or link which assumes the position (inverted) that the arch stones of an equilibrated arch would have. In Dr. Hutton's valuable "Tracts on Bridges," this principle is followed in his elucidation of the arch, and readers of that work will remember the diagrams given of various kinds of balanced arches, and the curves of extrados necessary to insure equilibrium. The theory, indeed, is older than Hutton. Belidor and Dr. Hooke both investigated the form of the extrados from the nature of the curve, and this theory has been made the foundation of a very interesting system of designing arches. According to this theory of the question, the stones are considered free from all friction—a condition which does not hold in practice. Mr. Richardson follows, as far as we can see, this theory. He enunciated the theorem that the weight on any point of the arch is proportional to the vertical line from the road line to the intrados at that point; that the horizontal thrust is the same throughout the arch, and is equal to the weight on the crown per unit of area multiplied by the radius of curvature there; and also that the bed-pressure at any point is equal to the horizontal thrust multiplied by the secant of the angle the curve makes with the horizon at that point. This rule is thoroughly mathematical and true for arches of equilibrium, and the author exhibited an instructive model of an arch equilibrated, and showed by inverting it, and suspending a chain weighted by steel rods representing the loads at each point, that the latter coincided with the road line. But the engineer architect have to do with arches in which the element of friction enters: the stones are cemented, and, therefore, the theory, however beautiful, does not hold good in every case. Instead of the separate arch stones or voussoirs, he has to deal with segments of the arch which turn upon certain edges. Thus, an arch which fails breaks into four parts, the crown sinks, and the haunches rise, the joints at those points opening. One of the questions to decide is the points at which rupture occurs, that being found to find out what horizontal pressure each of those lower segments have to sustain. From knowing the thrust and its point of action, the stability of the arch will depend on the mass and weight of the pier. The experiments of Rondelet and others have proved that the voussoirs unite into segments of the arch, and tend to overturn the abutment, acting rather as levers than wedges. He found, also, that the greatest thrust was in arches with an even number of voussoirs or a point at the vertex; that a keystone lessened the thrust. Nevertheless, the theory of equilibration should be known by all architects and bridge builders.

In alluding to the materials, the author showed the impossibility of dressing and bedding stones accurately. Practically, the stone-built arch is difficult to execute with precision: the facing stones only are cut to the true curve, the backing being filled-in with rubble and roughly executed. With brickwork the bricks can be all bedded in cement, being more convenient for handling, and a vitrified brick is equal at least to the best stone in resistance. The brick arch should be built in vertical bond, not in rings. Mr. Richardson finds that, taking the safe load in cement at 5cwt. upon the square inch, that an arch 15in. thick at the springing, and 12 5-6ths at the crown is sufficient for a span of 85ft. with a rise of $\frac{1}{8}$th of the span. He says: "As all loads and thrusts on such an arch are in direct proportion, if each dimension were multiplied by four we should have a span of 340ft. with a rise of 42ft. and an arch thickness of 5ft. This 5ft. thickness would give a sufficient margin of safety for the moving load, because 5ft. is only the necessary thickness at the springing, while that at the crown would be 9in. less. The total weight of this bridge would be 100,000 tons." Ring-built arches are advisedly objected to, as the rings tend to separate when any settlement takes place. Mr. Richardson does not rely too much on friction, and he is right: there can be no scientific arch construction that is not based on the principle of equilibrium, the line of thrust being kept within the middle third of the arch thickness, and in designing arches of brick or stone the engineer should always be able by diagram to satisfy himself of this condition. Whenever the line of thrust passes close to the lower edge of the arch ring at the haunches there must be undue pressure and a tendency to open at the other edge; in other words, the arch is inclined to drop at the crown. When it passes out of the arch failure must take place sooner or later. Instead of first deciding upon the curve and road-line, as is frequently done, the right course is to find the line of thrust for the given span and loading, and then make the arch conform as nearly as possible to this line. We agree with the opinion that brickwork, if correctly applied, would be found to excel iron construction in strength, durability, and economy—certainly in appearance. In the construction of masonry arches sufficient care is not always bestowed upon the drainage of the arches—a cause, we imagine, of many failures.

"BUILDING NEWS" DESIGNING CLUB.

AWARD OF PRIZES, 1886-1887.

THE following is a list of the subjects given in the past series of designs competed for, with an analysis in brief of the positions taken by the leading members:—

Subject A.—A Solicitor's House in a Country Town—
1. "Protoplasmic Globule."* 2. "Hugh."* 3. "J. R."

Subject B.—An Organ-Case for a Small Country Church—
1. "Laborare est Orare." 2. "Diapason." 3. "Eblana."

Subject C.—A Lych Gate for a Country Churchyard—
1. "Loidis."* 2. "Notts." 3. "North-West."

Subject D.—A Dining Room Buffet Sideboard—
1. "Protoplasmic Globule."* 2. "North-West."* 3. "William."

Subject E.—A Hooded Mantelpiece for a Hall—
1. "Protoplasmic Globule."* 2. "Yorkshireman." 3. "W. H. L."

Subject F.—A Small Village Social Club—
1. "Norseman."* 2. "Loidis."* 3. "White Rose."

Subject G.—A Mountain Church to seat 150—
1. "Norseman."* 2. "Protoplasmic Globule."* 3. "Selebi."

Subject H.—A Gamekeeper's Cottage—
1. "Loidis."* 2. "Student Win." 3 "Ierne."

Subject J.—A Rosewood Drawing-Room Cabinet—
1. "Loidis."* 2. "So and So." 3. "Pilliwillick."

Subject K.—A Small Stable for a Country House—
1. "Protoplasmic Globule."* 2. "Eton." 3. "Stability."

Subject L.—An Entrance Lodge and Arched Gateway to a Country House—
1. "Selebi." 2. "Loidis."* 3. "Norseman."

Subject M.—A Wooden Pulpit for a Town Church—
1. "Pilliwillick."* 2. "Protoplasmic Globule."* "Elean."

Subject N.—A Summer House—
1. Norseman."* 2. "Loidis."* 3. "Protoplasmic Globule."

Subject O.—A Pair of Model Cottages—
1. "Loidis."* 2. "Midnight." 3. "Eton."

Subject P.—A Village Publichouse—
1. "Norseman."* 2. "Loidis."* 3. "Clair."

Subject Q.—A Font in Stone and Marble—
1. "Protoplasmic Globule." 2. "Elean." 3. "Truth."

Subject R.—A Small Country Vicarage—
1. "Protoplasmic Globule."* 2. "Loidis."* 3. "Norseman."

Subject S.—A Cricket Pavilion for a Private Club—
1. "Protoplasmic Globule."* 2. "Northumberland." 3. "Lawton."

[* Those designs marked by an asterisk were illustrated in the BUILDING NEWS on the following dates:—Dec. 31, 1886; Jan. 21, 28, Feb. 18, 25, March 18, April 8, May 20, June 10, 17, July 29, Sept. 2, 1887.]

From this table of results, compiled from the several competitions, it will be seen that "Protoplasmic Globule" was placed first seven times out of the eighteen subjects submitted, second twice, and third once. "Loidis" is recorded as having been first four times and second five times. "Norseman" was awarded the first place on four occasions, but never second, though he won the third place twice. Eight illustrations have appeared of "Protoplasmic Globule's," nine by "Loidis" were published, while "Norseman" figured among our illustrations four times. The prizes, therefore, are thus awarded:—

"Protoplasmic Globule," J. H. Cook, 12, St. George's-crescent, Liverpool, first prize of £10 10s.
"Loidis," F. W. Bedford, Sycamore Lodge, Woodhouse Leeds, second prize of £5 5s.
"Norseman," H. T. Hare, 3, Regent's Park-villas, Gloucester-gate, N.W., third prize of £3 3s.

The following are deserving of special mention, and we give their names in order of merit, "Selebi" and "Pilliwillick" being ties, both having come in first once and third twice; both their first designs were illustrated:—"Selebi" is the motto of J. W. Twist, Portholme House, Selby, Yorks. and "Pilliwillick" proves to be W. H. Wood, 53, South-street, Durham. "Hugh" and "North-West" were awarded a second place on one occasion each, and their designs were thought worthy of publication, so they take precedence before "Laborare et Orare," who was first once but failed to secure illustration. "Hugh" is J. H. Goodman, 42, Oxford-road, Reading; "North-West" is J. A. Coe, 56, Elizabeth-street, Cheetham, Manchester; and "Laborare et Orare" is G. F. Terry, 12, St. James-street, Sheffield. "Diapason," "Notts," "Yorkshireman," "Eton," "Student Win," "So and So," "Midnight," "Elean," and "Northumberland" were second once each, and "J. R.," "Eblana," "William," "W. H. L.," "White Rose," "Ierne," "Pilliwillick," "Stability," "Elean," "Eton," "Clair," "Truth," and "Lawton" were each once third.

EXHIBITION OF THE TURNERS' COMPANY.

THE annual exhibition of specimens of hand-turning open at the Mansion House is not so large as we have seen it. In the Wood Competition the first prize of the silver medal and freedom of the company is awarded to C. Humphreys, of George-street, Grosvenor-square, for a pair of mahogany vases turned in a foot-lathe. The prize is taken for beauty of form, symmetry, and general excellence of workmanship. The shape is Greek in profile. The second prize (bronze medal and £4 4s.) is given to John Olley, of Bolsover-street, W., for a pair of satinwood tazze, or card trays or pedestals. The third is awarded to F. Honeychurch, Baker-street, and the fourth to H. Gates, of Lewes-road, Camberwell. Of the other prize specimens we notice a pair of brackets of Gothic design, by Geo. Adam Alderton, of Brighton, a pair of mahogany vases, with satinwood flutings on pedestals, and a set of flower-stands of teak and walnut, showing the effect of eight chuckings, with spiral columns holding glasses, &c., by Stephen Thwaites, of Hastings, who takes the ninth prize. A tenth prize for this class is awarded to T. Miller, of Preston. A very elaborate pair of Gothic candlesticks of pollard oak and ebony in a glass case forms a centre object of the table. We cannot admire the design, or commend this exhibition of industry misapplied to such articles. In the first instance, the design is not a judicious treatment for wood, and the ornament, traceried work of the stages, and the spikes, all meaningless. The designer says he has used 1,600 pieces of turned wood in its production—so much the worse, we say, for his commonsense as an artist.

In the competition for glass, which includes blowing, cutting, and engraving, the first prize in Class C (glass engraved by wheel only) is worthily bestowed on Paul Oppitz, of New Wandsworth, for a very chaste set of glass vessels, jug and goblets delicately engraved with the City arms, festoons, and other devices, including a glass vase having a medallion with figures, designed with much taste, and delicately executed by wheel and hand. The precious stones competition include some beautiful specimens of diamond-cutting, and brilliant work, also intaglio and cameo. Signor Guiseppe de Giovanni exhibits a cameo sculptured bas-relief upon a helmet shell, which includes Classical figures, illustrating Amphitrite on her way to marry Neptune, seated on a shell drawn by dolphins. The design is in ex-

cellent keeping and taste. Another, a conch shell, represents in bas-relief "The Toilet of Venus," with her attendant nymphs and tritons, in which the delicate rose tint of the background and the white reliefs make a very charming work of art. G. De Giovanni, the designer of these, also sends a carved glass tankard of flint crystal, representing a Bacchanalian subject engraved as a cameo. This wonderful specimen of art workmanship has taken the artist several years to finish. Signor Giovanni is a master of cameo engraving, and these works exhibit very high artistic ability.

In class E the first prize, silver medal and freedom of company, is given to W. Schmidt, of Hatton Garden, for a carved crystal bust, representing Britannia on a pedestal, with pearl helmet. The amateur and apprentice work in wood include several very creditable examples. The first amateur prize is given to Rev. C. C. Ellison, of Lincoln, and the first prize for apprentice work to George Willis, of Bethnal Green, the second to F. Nicholay, of Marylebone-lane. The glass competition we may mention is the first that the company has included in their yearly exhibition, but only two classes—viz, glass blowing without use of mould, crimp, or other tool, and glass engraving by wheel only—have been represented. The judges observe very judiciously with regard to the wood competition, that a vast amount of labour and ingenuity have been thrown away upon some of the articles, and we think that the qualities of beauty of design, utility, and other artistic principles should be steadily kept in view in awarding prizes for the future. The presentation of prizes by the Lord Mayor takes place to-day (Friday) at 12 noon, in the Egyptian Hall of the Mansion House.

HOLLOW BUILDING CONSTRUCTION.

THE hollow voussoir or tubular arch brick has found a large demand in the United States, and several companies are manufacturing the fireproof tile. The patent Doulton-Peto fireproof floor, formed of pottery blocks, and well known to our readers, is one of the best forms of flat arching for floors, as the rolled iron joists or girders are protected by the springing blocks which fit on the lower flanges by means of grooves. The soffit of the arching, when finished, presents a continuous surface of the blocks with dovetail grooves, which form the key to the plastering of the ceiling. Similar grooves are cast at the sides of each block, so that when they are put together with cement the grooves form dowels. Floors constructed with these hollow blocks are found to carry great weights, all thrust being counteracted, and, in fact, an arch constructed upon this system forms a solid block or lintel rather than an arch in which thrust is felt. It may be as well to remark that there are in this kind of floor high resisting qualities and great lightness combined which are not found in many of the patented systems of fireproof floors in which solid brick arching is employed. The air space formed by the cavities is of advantage. The introduction of this kind of floor for dwellings built in flats is to be much desired, and architects intrusted with buildings of this class would, we are sure, find them desirable both as a fire-resisting and sanitary floor, capable of deadening sound as well. For warehouses and shops the hollow tile flooring possesses many advantages over timber construction, though for large and heavily-weighted floors the solid brick or Dennett arch is certainly the best. Several forms of hollow bricks and tiles are to be met with, some for building walls, others for arches and piers. Wherever lightness is a consideration, we believe the architect would be doing well to avail himself of their use. In many positions where the foundations are not very reliable, the hollow brick can be employed, and we know of one architect who has used them in churches over the chancel arch to lessen the thrust. For vaults, the old Italian architects wisely employed hollow pottery, and we know that Soane used hollow tiles in vaulting some of his apartments at the Bank. There is another obvious use for hollow bricks, that is in building walls or piers over breastsummers or girders, and partitions between rooms. As a lining to stone walls the hollow brick is invaluable in arresting damp, and superseding battening. In the BUILDING NEWS for 1858, a very exhaustive paper on the subject will be found illustrating the English and French systems of manufacture, to which we may refer our readers. Light-arched floors and roofs are common in India, where several buildings have flat roofs formed of tiles about 1 foot square and 1½in. thick, in two layers, breaking joint upon beams about 3ft. apart. A sort of concrete, 6in. thick, is laid over the tile surface of broken bricks and lime beaten down, plastered, and then rubbed to a fine surface, which is said to be impervious to wet. A double thickness of bricks laid flat with the joints broken makes a very strong dub. For groining and vaults the hollow pottery set with gypsum affords the architect every facility, combining lightness with solidity and strength; indeed, such vaults, with the haunches filled up with rubble stone in plaster, possess no destructive action on the abutments, and in time become compacted shells that may be carried bodily at the four points of support.

The well-known Dennett system is, for all purposes of vaulting, perfectly free from lateral pressure, and as it can be used to form groins, domes, and vaults without ties, the architect has in it an excellent substitute for masonry. When builders of theatres and other edifices divided into floors have these materials ready to their hand, it is extraordinary that they still adhere to the old systems of constructing their floors and roofs. The expense is looked at, but we have no doubt whatever that it would be found the cost on a large building would be really less in the saving of labour, timber, and iron. Every theatre would be safer if its auditorium roof were a flat dome of concrete or hollow pottery, and its tiers and galleries constructed upon the principle adopted at Mr. Terry's new theatre and at the Alhambra.

HOW A MARBLE STATUE IS MADE.

MR. JOHN A. P. MACBRIDE, sculptor, who was introduced to a large audience, chiefly of working men, by Sir James Picton, gave a practical lecture on the above subject on Tuesday week, at the Rotunda Lecture Hall, Liverpool. After giving a sketch of the art and its great antiquity, the lecturer drew a profile in chalk on the blackboard, which he filled in with clay, and proceeded to demonstrate the building up and modelling of a portrait bust of soft clay. He stated that there was a general and erroneous opinion that in taking a portrait bust it was necessary to take a cast of the face. This was a mistake, for the head lost all the spirit and go by such a mechanical process, that should distinguish an artist's work. The truth was not always that which appeared to be true, and the sculptor had to convey some idea of the character as well as of the mind of the sitter; and a man who knew his work ought to be able to do so with his fingers. Carving was a secondary consideration. The lecturer then explained the process of pointing a marble statue. In this process, the model and the block of marble were each fixed on a base called a scale stone, to which a standard vertical rod could be attached at corresponding centres, having at its upper end a sliding needle, so adapted by a movable joint as to be set at any angle and fastened by a screw when set. The sculptor having marked the governing points with a pencil on the model, the instrument was applied to these, and the measure taken. The standard being then transferred to the block base, the pointer, guided by this measure, cuts away the marble, taking care to leave it rather larger than the model, so that the general proportions were kept, and the more important work then left for the sculptor's hand.

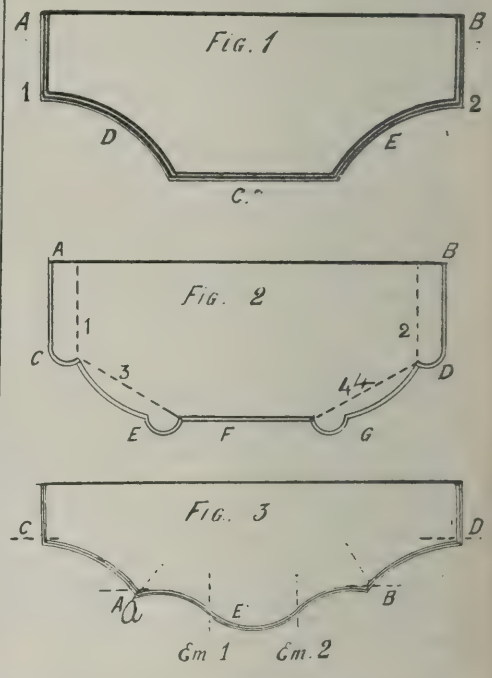
CHURCH BUILDING IN CHISWICK.

A NEW parish hall was recently opened at Bedford Park, from the designs of Mr. Maurice B. Adams, F.R.I.B.A. The buildings include the north aisle to the church of St. Michael's, and the style adopted agrees with the earlier work. Red brick is used for the walling both internally as well as out, with stone dressings, the cornice and gables being of Doulting stone. Cliff's glazed bricks are employed for lining the walls as a dado inside the hall, and give a great variety of tone in reds and brown, which harmonise well with the red facing bricks above. The roof is coloured a rich green, with cream panels, and the woodwork below is of Indian red. A gallery is situated at the west end of the room, with balustered front and solid uprights. Wrought-iron grilles occupy the arches over the main entrance, to which there are fixed some running gates on a steel tramway inclosing the porches when not in use. The carving to the pediments over the doors, &c., was executed by Mr. James Frampton. Messrs. Gregory supplied the wood-block paving, and Messrs. Godwin and Son, of Lugwardine, the encaustic tiles. At the end of the hall is a raised class-room, shut off by a pair of sliding doors suspended on wheels. This room serves as well for theatrical performances, concerts, and lectures. A cookery adjoins, with top light and ventilation, and there are store rooms, coal cellar, &c., in the basement. The roofs are covered with the Coalbrookdale Company's Broseley tiles. In the church the great east window has been filled with stained glass (by Mr. Bell, of the firm of Messrs. Davison and Co.), representing the Majesty with St. Michael below, and round the throne are Principalities and Powers, and then hosts of Angels. The east window also just erected in the south aisle represents the angels at the Sepulchre. A marble mosaic pavement from the architect's designs is being carried out for the chancel by the same firm. Messrs. Adamson and Sons, of Turnham Green, are the builders who have carried out the several contracts. Near Bedford Park on Acton Green during the past month a new church, dedicated to St. Alban, has been started, from the plans of Mr. Edward Monson, jun., A.R.I.B.A., of Acton. Mr. J. Dorey, of Brentford, is the builder, whose contract is about £3,500. The site adjoins the old school rooms. At Turnham Green Mr. J. Brooks is erecting a chancel to Sir G. G. Scott's church, built about 40 years ago by the munificence of Mr. Sich, the brewer. The new work is in agreement with the main fabric with lancet-like windows in stone, and walling of flints set in black mortar. The interior is more pleasing, and is characteristic of the architect. Part of the scheme is being left over for a further contract. Messrs. Chatfeild Clarke and Son are the architects for a new church, of which the nave has been consecrated, on a site adjoining the high road at Gunnersbury. It is dedicated to St. James. The nave is of bold proportions, with simple lancet windows for the clerestory, and low built aisles. At the west end is a semi-circular baptistery and a porch. At Chiswick, Messrs. Newman and Newman, of Tooley-street, are about to build a nave to St. Mary Magdalene's Church, transforming the present church into a chancel. The scheme is to cost £6,000 when complete, and will provide accommodation for 500 people, exclusive of the choir. Messrs. Powell, of Whitefriars, are erecting three new stained-glass windows in the south aisle of the parish church, under Mr. Pearson, R.A., who restored the building. The Roman Catholic Church recently built in the High-road, Turnham Green, to our Lady of Grace and St. Edward, was from the designs of Mr. John Kelley, of Leeds. The builders were Messrs. Priestley and Gurney, of Hammersmith. Their contract was £3,400, and the plan of the church is said to be that of a Roman basilica. It is constructed in brick entirely, and faced with Bracknell "reds," supplied by Messrs. Lawrence and Sons. The campanile is not yet built, and the church suffers in consequence. Adjoining, a large block of shops is building; but we hear so well is the work done that shores have already been introduced to keep them from falling.

RAIN-WATER TANKS.

THE capacity required for tanks collecting rain-water is necessary to be known before provision can be made for them. It has been stated on good authority that the tank may contain half a cubic foot of water for each square foot of roof surface, the minimum being 2in. in depth, or one-sixth cubic foot to every square foot of roof. Provision should be made for at least six weeks' consumption in summer. The yield from a slate roof is found to be about 10 per cent. more than from a tiled roof; but the tank should be large enough for sudden and heavy downpours. It may be of service to say

something of rainfall. Mr. Symons, the chief authority on the subject, observes that an inch of rain is equivalent to a gallon of water over a surface of two square feet, or a fall of 100 tons per acre. An inch of rainfall upon an acre is equivalent to 22,622 gallons, according to Mr. Bailey Denton. For the computation of rainfall over a given area, the rule is to multiply the inches of rainfall by 3,630, which will give the cube feet per acre. We have observed large buildings with extensive roofs very badly provided with gutters and stack pipes, as if these matters were of no importance. The large surfaces of slate roof ought to be made to drain to well-distributed points, so that one stack pipe should not have to do the work of two or more. The plan of a roof, with its ridges, hips, valleys, and gutters, represents a watershed; the ridge and hip lines divide the areas of the roof to be drained by separate pipes, and these should be properly proportioned to carry off the heaviest rainfall. Instead of this division of the surface, the arrangement of stack pipes is a matter of guesswork: the largest surfaces are badly provided, and the water, overflowing the gutters, finds its way through the roof, or saturates the walls. If more care were taken over these parts of buildings, and tanks erected for domestic purposes with "separators," there would be greater skill probably shown in the planning of roofs, and the rain-water gutters and stack pipes would be made part of the architect's elevations, instead of left to chance.



FURNITURE BEADS AND MOULDINGS.

(*Continued from p.* 506.)

THE class of beads known as "cock-beads," applied to the face of work like drawer-fronts, are glued to the edges both top and bottom. They are got out wide, and worked down the requisite amount by a plane made specially for the purpose. After these are worked, the sides are fitted and mitred to them, and treated in the same manner. A series of beads arranged vertically are now frequently used in cabinet-work to replace carving. For this purpose the wood is jointed up in sections for turning, being afterwards cut where previously jointed. You can readily see the number of sections most suitable and the diameter the work should be finished, by comparing it with the space or width where it is to be placed.

Mouldings.—Among the many forms which occur, the following are the most important: Those worked upon a plain top, or applied to a veneered top or surface. In the latter case, their preliminary arrangement will have to be considered. Those intended for shaped work, such as door-heads—circular and elliptical, &c. —corners, backs, and the manner of strengthening these in the larger kinds of work. In addition to these are plinth, cornice, rabbeted, projecting, or bolection, veneered and ormolu mouldings. Other forms of moulding are seen in general shaped work—brackets, pateræ, pillars, &c.; also in drawer-slips, pen hollows or trays, glass frames, table-flap joints, shelf edges, and other things. The formation of mouldings and the method of lining them up I shall also make a few remarks upon. I will take them as far as possible *seriatim*. You will require for your work, besides a saw, chisel, a hard wood (beech or lime) mitre-block, and mitre shooting board. It is preferable to have, especially for larger kinds of mouldings, an iron mitre-plane, although an ordinary trying plane will do for most purposes, if in first-class order. The shooting board should not be less than 18in. or 20in. long. It is, of course, possible to make the mitres with mitre-cutting machines, several kinds being in use; but I am not considering this class of work at present. There are several other tools and articles in addition to the above; but it will be more convenient if I speak of them as occasion for their use arises. If it is required to mould a solid top or surface having straight edges, it should first be planed over and taken to the requisite size it is finally to be. That is, square it up to the fullest size the moulding projects, making also an allowance for the amount it is to hang over from the work, at each end or sides, foot and back, as the case may be. In doing this you should be careful to see that it is set for trying perfectly true, and if any part, such as a door shutting in front, for example, is to be afterwards added, make due allowance for its thickness in front. This is always best done by offering the part itself to the carcase, and you are less likely to make an error than by simply making a measurement allowance. The next process is to gauge round the top from the outer squaring, the inner line to which the moulding is to be worked. In cabinet-work very few cases arise where a moulding is worked level from the surface; even if it be one of a simple nature like a plain chamfer it is always sunk. In some classes of inside work like shelf edges it might be so, and they would be merely rounded, but it is not of frequent occurrence. After gauging, the gauge marks should be deepened with a chisel. The edges are now roughed out—that is, they are worked with the trying plane approximately to the final shape they are to be. Thus, suppose we intend having a thumb moulding upon the edges: after squaring and gauging, the upper part of the edges may be planed off, leaving less to be finished; rounded over with the rabbet plane, or shaped with the moulding plane if a different one were required. The upper part should be carefully removed with and then finished with the rabbet plane. In roughing mouldings, you must be particular not to work them too bare, and for the sake of saving a little labour leave insufficient for the final shape. You will readily see by looking at a moulding how far to go with safety, and also the most suitable inclination (bevel) in planing to take. The moulding should now be finished by papering; for this purpose a piece of wood the reverse shape of it will be required. This operation I have described previously and need not repeat. With a veneered surface the process would be varied. The top which it is intended to veneer would be planed over and squared if its edges were to be straight. It should be got out smaller than usual; the addition of the other will make it the required size. After squaring, the edges are bevelled to about an angle of 40° to 45° and toothed. The wood corresponding with that with which the top is to be veneered should be cut in lengths, planed, and the under-side toothed. Its width must be greater than the top thickness (you may with advantage increase it by half, as this will facilitate fitting). The thickness of these edgings must be sufficient for the moulding intended to be worked, with an allowance of one-third or one-fourth added. They should be glued on, care being taken to fit them true. At the corners they are mitred. It is advisable to allow one side, the front or back, to set before fitting and gluing the others to it; by this means there is less likelihood of any shifting. When all are glued round they may be levelled to the top, which can be veneered. The mouldings are then worked and finished as in the first example.

With Shaped Solid Tops.—I am employing the term "shaped" with reference to the edges alone, the surface being seldom so except in small work. The preceding remarks are applicable, but there are one or two points I can better explain from simple figures. Fig. 1 is the plan of a cabinet top; its edges, with the exception of the back, which is straight, being moulded. After squaring the edges A, B, and C, and the ends A 1 and B 2, the curves at D and E should be marked. This is done with a striker, after placing the top upon the work. The wood is now cut out with a bow-saw roughly to shape; this is then levelled and finished with a spokeshave. The inner gauging from the moulding can now be marked from this, the edges bevelled and finally hollowed with the gouge, or rounded, as the case may be. Figs. 2 and 3 are also examples—Fig. 2 of a top, Fig. 3 of a bottom board intended for a cabinet open at the bottom. Both are supposed to be veneered. The wood for each will be got out and prepared in the ordinary way. I may here mention that it is advisable to neglect the shaping at first, and treat it simply as rectangular, the preliminary working being easier from so doing. In Fig. 2 the edging at A, B, C, and D is best glued on the width represented by the dotted lines 1 and 2. This will allow sufficient material for shaping at these points; that for the curves C E and G D taking the direction of the lines 3 and 4 as shown. From these two the whole shaping should be made, leaving the front F straight. You will find it best to apply the pieces at C E and D G first, and fit the remainder to them. With Fig. 3 there is no necessity to make mitres at A, B, C, and D, as the board, being supported by legs, is joined to them at these points, and if made they would have to be afterwards cut out. With the slips, however, you should allow about

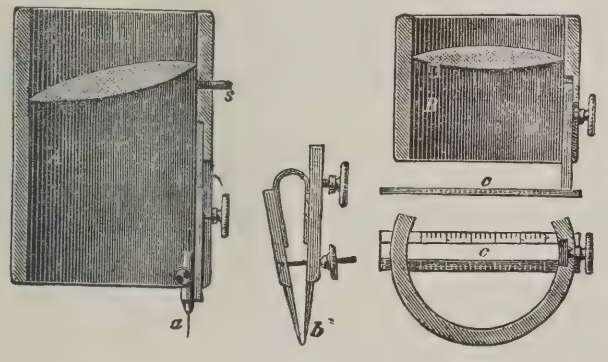
½in. more than the leg width. This amount will enable you to fit them truer. The front, from A to B, is worked as follows:—Round the board at E as drawn, and hollow the slip to it, then shoot the edges from A and from B, glue them on, allowing them to intersect at E *m* 1 and E *m* 2. T. H. S.

(*To be continued.*)

MUNICIPAL ENGINEERS' ASSOCIATION.

FROM the papers we have received relating to the fourth examination of candidates for the offices of municipal engineer and local board surveyor, carried out under the Municipal Corporations and Local Government Acts by the Association at the town hall, Manchester, on the 7th and 8th inst., we can entertain little doubt as to the practical character of the examination. In the paper on building construction the candidate is given ten questions: the names of the woods used in building, and their qualities and uses, the composition of good mortar, and the faults of mortar used in "jerry" work are required amongst others. One of the questions is—"What are the chief precautions to be taken in arranging the exits from a theatre as regards doors, passages, and stairs?" The last relates to the requirements of the Model By-laws as to thickness of house walls; these the candidate is supposed to give in his own words. Another of the examination papers gives the fourteen test questions in "Engineering as Applied to Municipal Work." These include questions on the adjustment of the theodolite; the main lines and ties in chaining the streets shown on a given sketch plan, which includes a large area of Government property that is inaccessible; levels of surfaces and sewers. Others refer to hydraulics or sewerage; the calculation of capacity of outfall sewers from certain data is the most difficult of those given; reasons for adopting a certain kind of paving in streets, and the meaning of "average meter indication" in lighting. In sanitary science the candidate is examined on ventilation, with respect to width and length of streets without cross streets; minimum area of space behind building; modes of ventilating buildings; the conditions necessary to secure a healthy site; and how to deal with subsoils and sites, positions of w.c.'s, sinks, and baths. Under sewage disposal as another sub-heading, the candidate is required to state the conditions under which chemical treatment, intermittent filtration, irrigation, and other methods may be adopted. The

sewering of towns is another division. Such questions are how to find the maximum dry-weather volume of sewage, and the provision for rainfall per hour; the minimum velocity required in sewers. Other questions relate to house-drainage, which is also made a division of the subject. These are generally simple, though of a practical kind. We have already published the names of the examiners and those gentlemen who have been granted certificates of competency.



BOOKS RECEIVED.

The *Architectural Association's Notes* for October gives as a frontispiece a good portrait of Mr. John Slater, B.A., the new president; also a biographical notice, from which we learn he has just attained his fortieth year. A very suggestive letter, signed "B.," on the fewness of candidates who go in for the compulsory examination of the Institute is worth reading. The writer thinks the work of the Association requires amending in three directions, which are summarised as (1) want of an efficient system of personal supervision; (2) a mode of testing knowledge acquired at stated periods; (3) a more satisfactory system of imparting information. These are excellent suggestions upon which the Association may base their future action, though we are very much afraid that all facilities will fail to create students. A studious habit is born, not acquired, and our experience is that young men will not join classes or take to reading unless they have an inclination. We should lay particular stress on personal supervision as the most important of the three suggestions. A preliminary entrance examination for the A. A. might insure that more men of the right sort entered; but, on the other hand, it would deter many young men from joining, and the Association would lessen its power for usefulness. Sessional examinations are useful, and certainly could be adopted. An illustrated account of a town in Calvados, France, is resumed—the sketches are clever—and there is also a useful paper on "Strains in Structures," by F. W. Quick.——*The Decorators' Assistant* (Second Edition), published by Crosby Lockwood and Son), has been revised. As a guide for decorative artists and amateurs this little compilation will be found of service. It is full of useful receipts of value to decorators, painters, gilders, and students of art. The introduction is written by Mr. H. Atkinson, architect, on "Painting applied to External Architecture." Many of the hints are judicious, as that external colouring of a house should depend on and be subject to the surroundings. For red brick cream white is recommended; but we prefer light and pea green. "Internal Decoration" is the subject of another chapter by A. Hessell Tiltman, M.R.I.B.A., in which will be found many useful hints. The remarks on "Colours and their Combinations," "Instructions for Mixing Colours," and Chevreul's remarks on "The Properties of Oil Paints" are of value, and the book contains in a small, handy size the gist of larger treatises on colour and technical processes.——*Vestiges of Old Newcastle and Gateshead*, by W. H. KNOWLES and J. R. BOYLES (Newcastle: A. Read). We have received Part 1 of this excellently got up small quarto, illustrative of the remains of Mediæval architecture in the twin boroughs on the Tyne. The work is to be completed in twenty parts, published at 1s. 6d. each, and each containing three full-page plates. Those to the issue before us are all by Mr. W. Harry Knowles, and illustrate the vicinity of the quaintly-named "Side" on the northern bank of the river—viz., the Black Gate, Temperley's Court, and the Sandhill, and smaller sketches inserted in the text of the letterpress show the plastered houses, with slightly projecting upper stories, which still form so picturesque a feature of the district. The work is written in an interesting style, and bears evidences of careful research. It will become increasingly valuable in future years. ——*The Work of the Nevilles Round Darlington.* (Whiting and Co., Sardinia-street, W.C.) Mr. J. P. Pritchett has reproduced in pamphlet form a paper read before the British Archæological Association at Darlington in July last. The paper described the many works of the great family of Neville by which Darlington is surrounded—the castles they built or enlarged, the cathedral, conventual, collegiate, and parochial churches they founded, erected, or added to, and in which they had their chantry chapels. Clearly drawn plans, specially made for the purpose from measurements, are given of Raby, Barnard, Brancepeth, Middleham, Snape, and Sheriff Hutton Castle, and Staindrop and Middleham Churches, greatly adding to the value of the well-written historical paper.

DRAWING INSTRUMENT FOR ACCURATE WORK.*

THIS arrangement consists in a cylindrical metal or horn mounted lens two to four centimètres long, and magnifying two or three times, and two or three centimètres in diameter, whose side is provided with a contrivance for holding after it has been pushed into place a copying needle, a protractor, &c.

While hitherto the architect, in using millimètre paper, must hold separately in his hands a magnifying glass and needle, while the engraver holds the engraving tool inclined in one hand and the magnifying glass in the other, or must work under a large lens standing on three feet, it is now possible, by a firm connection between the lens and needle or other instrument, to draw directly with one hand, and under the lens. In the accompanying cut one of these lenses is shown in section A, in which the glass is set obliquely, in whose focus the needle *a* is held, and the field of view is enlarged. A longer description is unnecessary, as the illustration gives the best explanation. It need only be remarked that the stud *s*, projecting a little near the glass, is for the purpose of preventing the instrument from leaving the position coinciding with the plane of the drawing. For architects and engineers is provided a small compass *b* of about 2cm. diameter, for laying off parallel widths, for making smaller scales, and the like. In these cases it is substituted for the needle. In like manner for calculating cross profiles by graphical methods, for reading parallel divisions, for estimating areas, or revising maps, a finely divided, prismatic, ivory rule *c* can be placed under the glass B, and will do good service. In this case the plane of the lens must be perpendicular to the axis of the tube.

For draughtsmen a parallel drawing pen, something like *b*, is used, which gives several lines at once, perfectly parallel and close together; or a drawing pen with which the smallest signatures, such as boundary stones and figures, can be made neatly and exactly, which is secured like the needle *a*, and for which the cylinder serves also as pen-holder, offers a great advance.

Thus a whole series of instruments can be used with the lens. For instance, a naturalist can use with it a knife or other instrument. To avoid injury from the instruments, one should, in laying down the cylinder, place it on its side. It is also recommended that on the outer tube of the frame, which is appropriately lacquered of black colour, white arrows should be placed in the direction of the points of the instrument, so that the eyes shall be protected from injury in handling the instrument, as by the points being stuck into the pupil, owing to lifting the instrument in an inverted position.

* By J. LEURKE, in the *Zeitschrift für Instrumentenkunde.*

CHIPS.

The first section of the work of rebuilding the parish church of Chatham, the new chancel and transepts, will be dedicated by the Bishop of Rochester on December 1st. Mr. A. W. Blomfield, M.A., is the architect, and the cost of the present section has been £3,000, another £6,000 being required to complete the work.

The Carpenters' Company announce a second exhibition of works in wood, to be held at Carpenters' Hall, London-wall, in May and June next, when medals, money prizes, and certificates will be awarded.

The Countess Cowper laid on Saturday the memorial stone of the Church of the Holy Redeemer, which is being built in Exmouth-street, Clerkenwell. The Marquis of Northampton has given the site, and the church will cost about £9,000.

It has been decided to erect at Bradford a memorial statue of the late Mr. W. E. Forster, in an open space between the Post-Office and the Midland Railway Station, which has been named by the corporation "Forster-square."

The Government has sanctioned the definitive adoption at Chichester Barracks of the iron process for the purification of sewage, invented and patented by Mr. Conder, M.Inst.C.E.; and the War Department has taken over the supervision of the works, which have been conducted by Mr. Conder for the last fifteen months, under the order of the Secretary of State for War.

The memorial stone of a new Baptist chapel in Linthorpe-road, Middlesbrough, was laid on Friday. The chapel will cost £24,000, and is being built from the plans of Mr. Lofthouse; Mr. Kirks is the builder.

At the last meeting of the Court of Common Council a report was presented by the Officers and Clerks Committee recommending that the office of City Architect should be abolished, and that only a City surveyor should be appointed at a salary of £800 per annum. An amendment in favour of the appointment of another architect was negatived by 79 votes to 71. The report was ultimately adopted by a majority of eleven. Mr. G. Shaw gave notice of a motion to rescind the resolution.

A new district church is about to be built for Easington, near Loftus-in-Cleveland, from plans by Mr. C. Hodgson Fowler, F.S.A., of Durham. The church is to seat 220 persons, at a cost for erection of £2,400.

The foundation stone of St. Luke's Church, Moorbottom, Cleckheaton, was laid on Saturday. Designed by Mr. Medland Taylor, of Manchester, the church will be Geometric in style, and will seat 643 persons. The building contract has been let for £5,040.

The highest honours have been awarded to Messrs. John Hall and Co., Stourbridge, at the Adelaide Jubilee Exhibition, for their exhibit of white and coloured glazed bricks, patent porcelain fireclay bath, and fireclay goods, all of which were their own manufactures.

The centre portion of the reredos for Lillington Church, near Leamington, has now been placed in position. It is a representation of the "Lord's Supper" in high relief, the figures being carved out of a solid block of Caen stone about 18in. thick. The panel is surmounted by a battlemented cornice, with a string of Early English carvings beneath. This is supported by columns of Devonshire marble of rich colouring. The structure is not yet completed, inasmuch as side wings (which are designed to rise to a much greater altitude than the centre portion) have yet to be added. The whole of the work has been intrusted to Jones and Willis, of Birmingham and London.

The terminus site of the Roman Wall at Wallsend, which had been threatened, is in a fair way of being preserved from the encroachments of the modern builder. The land, which contains an area of an acre, is valued at £1,000, and Sir Benjamin Browne, the present Mayor of Newcastle, has offered it to the Wallsend Local Board for £250. The terms will be accepted. The course of the moat and the outline of the ancient wall are clear and well defined; but, except where broad trenches have been recently cut, the stone work is hidden from gaze by a dense covering of luxuriant grass.

WAYSIDE NOTES.

EVERY architect will regret the death of Mr. Beresford-Hope. He was a man of a class that we can ill afford to lose, and for whom the whole profession may well mourn in spirit.

If I remember aright, the last time that I saw Mr. Beresford-Hope was in the committee rooms of the House of Lords, when the question of the proposed alterations to Westminster Hall was under consideration. It was easy to distinguish the intelligence of the questions of the man who was, in effect, no mean architect, from those of others of the Committee who were so far less conversant with the matter under discussion. On this occasion, I remember, I could not but help thinking that there was a touch of sadness almost in his face—such a disheartened expression as might well come over one who had, single-handed, to meet the arguments, and endeavour to outweigh the prejudices, of the uninformed.

Now that Mr. Beresford-Hope is dead we shall doubtless, as is the wont of humanity, realise the value of a Member of Parliament who, being of ample means, had no object to make politics a business, but who, in working for the well-being of his country, became, also, a champion of art and letters, and a friend of the architect and artist. We may at present, however, look in vain for a second Beresford-Hope—for a counterpart of the man who has so lately gone to his last rest.

I noticed last week that the parish church of Detling, in Kent, had been restored. There is, I believe, a good old sepulchral cross of the 15th century at Detling. It figures, it will be remembered, as the frontispiece to Bloxam's "Gothic Architecture"; and it is to be hoped that it is still to be seen, as, from the illustration, it has always appeared to me to be a remarkably neat cross. There is so much that is hideous and dreadful in the sepulchral memorials that the "monumental" stonemason turns out, that to come across an object like the Detling example must be very refreshing. It is not a little astonishing that our churchyards and cemeteries should be so disfigured at present by slabs and monuments of such terrible design as we everywhere find. Taste, which of late years has so improved in most branches of art, seems to have missed the churchyard monument.

It is true that at times we find some special cases in which the skilled designer's services are called in; but these are quite the exception, and even in them we cannot all of us agree with the taste displayed. But the small sepulchral monument seems to have been wholly relegated to the care of the so-called monumental stonemason, both as to its design and execution. Consequently the appearance of our cemeteries and churchyards are, *æsthetically*, a disgrace to the age. It is rarely, indeed, that we find a small modern cross, tablet, or slab that is worth looking at.

Mem.: Perhaps the most satisfactory form for an unassuming sepulchral monument is that which is modelled after the manner of the old Irish crosses. If designed with a good outline, and of substantial proportions, with detail on the old lines, but modified to suit the age, they may be made objects of extreme beauty. There is a very beautiful memorial of this description—a modest little cross that may be found by any wanderer in the Isle of Thanet, in the north-west corner of Margate cemetery. It was designed by a gentleman as a memorial to his wife, and has always appeared to me a singularly pleasing object, being executed in a delicate green-tinted variety of stone, and of excellent outline and proportions.

The information about the alterations at the Nottingham Theatre Royal is timely. Judging from the plan that Mr. Hine gives, it would appear that the sooner these alterations are effected the better. The existing arrangement certainly looks bad enough, and the appearance, on plan, of the relative proportions of gallery and exit quite makes one shudder.

As regards the suggestion to employ inclined planes in lieu of stairs, it might be a beneficia alteration in some cases; but should the gangways become at all slippery they would be most dangerous. It does not, therefore, appear to me to be much good to reply upon the inclined plane. People are used to stair-mounting, and the sudden arrival of a panic-stricken crowd upon such a gangway might cause confusion worse confounded, unless every person knew of its existence, and had practised ascending and descending it. In the case of warehouses and buildings, such as Mr. Murray instances, it is a different matter. For a *few* persons only the gangway would be three or four times as quick as the staircase, but in the case of a crowd it is to be doubted whether it would not be rather a source of danger. The flat treads of a stairway afford, at any rate, a grip for the foot should one fall, which the inclined plane of 1 in 2½ or so might not do. At least, so it appears to me. But we should be thankful for the suggestions made last week, as it is only by obtaining many ideas that the cause in question can be advanced. So now, gentlemen, please, the next suggestion.

The City Fathers, I see, have decided not to re-appoint an architect, but are to have a surveyor, as they before proposed.

There appear to be some curious points in the advertisement of the Newchurch-in-Rossendale Board School competition. But it seems straightforward enough, or it would do, if the paragraph about the commission which is "*to be agreed upon*" were a little clearer. It would be as well if the board were to decide upon this point without delay, if they desire a successful competition.

I wish the scheme for a Provident Institution for Architects' Assistants every success. The architects themselves might help the assistants in this way in return for their labours on their behalf. The architectural assistants form too useful and honourable a body of gentlemen to want for such an institution. They toil much, and deserve help if their aim be a mutual assistance society, to aid their distressed fellows, and to enable them to keep their own minds free from over-anxiety as to what the morrow will bring forth.

It may be considered that the wholesale use of constructional ironwork received a condemnation at the conclusion of the inquiry into the recent disaster at Westbourne-grove. But the practice has long since taken deep root in modern civil architecture, and, though so destructive of all art in most cases, we must fall in with the general demand, and peg away at the hard nut referred to some months back. Would that we could as easily and, I may perhaps say, coolly put aside the question as Mr. Ruskin has done in the "Seven Lamps."

"In Normandy." I fancy I was in Normandy a short time back. At least, there is an impression left upon me to that effect. Certainly I have a recollection of seeing something that was not unlike the sketch given last week. And the Bishop's Palace at Evreux it *is*, sure enough, unless there is some "double" of this edifice in Normandy. Well do I remember making a "highly-coloured" sketch of the very same part of this building—the said sketch being executed with some difficulty, thanks to the thunderstorms that would occasionally come from over the hills of Normandy. A very beautiful picture did this palace form, with its great slated roof and grey stone walls, its green weathered buttresses, and bright red bricks in the chimney stacks. And I remember that the Bishop himself appeared upon the scene whilst I was engaged in sketching. Tripping lightly down from his carriage and pair, he made a fine point of colour in the picture, as he ascended the doorsteps in gorgeous purple robes.

GOTH.

The new cemetery at Windermere was consecrated on St. Luke's Day. It has been laid out from plans by Mr. Robert Walker, of that town, who also designed the chapel, which is Late Perpendicular in style, the lodge, and other buildings.

The market and music hall at Barnstaple are about to be enlarged, from plans by Messrs. Gould and Webb, of that town.

LONDON BRANCH OF THE CO-OPERATIVE WHOLESALE SOCIETY (LIMITED).

THIS building is situated in Leman-street and Hooper-street, Whitechapel, in close proximity to the new goods station of the London, Tilbury, and Southend Railway. It has a frontage of 150ft. to Leman-street, 110ft. to Hooper-street, and 160ft. to Rupert-street, with a total area of 18,000ft. The Leman-street front is shown in the illustration; the lower portion is built of granite and Portland stone, with blue Pennant stone pilasters, the upper portion being of red brick, with Portland stone dressings. Each floor is fireproof, constructed of iron joists, placed about 3ft. apart, and filled in with concrete, and laid with Lowe's wood-block paving. The basement and ground floors are used for the receipt and delivery of goods, and are faced with white glazed bricks. The basement extends under the pavement where it is lighted with Hayward's daylight prisms. A vanway runs through the centre of the building, having an entrance in Leman-street, and an exit in Hooper-street, in which are five loading doors, fitted with hydraulic cranes. The official department is on the first floor, having an office with accommodation for 70 clerks. Sale-rooms, buyer's offices, strong-room, and lavatory, &c.; the latter is lined with glazed tiles, and fitted with automatic flushing apparatus. This and the principal floors are lighted by the Wenham ventilating lamp, and warmed by hydrocaloric coils. On the second, third, and fourth floors are the drapery, boots and shoes, and furnishing departments respectively. The fifth floor contains a large dining-room for the employés, and an assembly room, 65ft. by 37ft., the walls of which are elaborately fitted up with walnut framing, pitch-pine and sycamore panels, with mahogany mouldings. The ceiling is divided into panels, and filled in with fibrous plaster having floral designs in relief. Walnut pilasters, with carved cantilevers, support the principal beams. The centre of the ceiling is formed into a coved dome, with a flat light of stained glass. Messrs. W. H. Lascelles and Co. executed the joinery for this room. The kitchen is partly in the roof, and is fitted with every convenience. The stove was supplied by Messrs. Ashton and Green. A double lift communicates with the dining-room beneath. Every precaution has been taken to render the building fireproof, and, in order to insure this result, all the stairs are of stone, and iron doors shut off each department. The contractors were Messrs. Martin, Wells, and Co., of Aldershot and London. Mr. Boyce was the clerk of works, and Mr. W. H. Sharpington the general foreman. The lifts and cranes were supplied by Messrs. Waygood and Co. The building was designed and carried out under the supervision of Mr. J. F. Goodey, architect, of Colchester.

CHIPS.

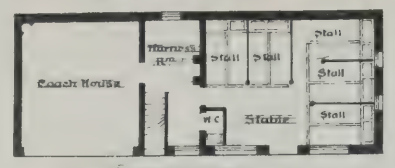
A Wesleyan chapel and schools are about to be built at Goose Green, Wigan, from plans by Messrs. Isitt and Verity, of that town.

The West Bromwich School Board have adopted plans by Mr. E. Pincher, of High-street, in that town, for the erection of schools for 1,400 children in Spon-lane.

New stalls of English oak and other fittings, the work of Mr. Harry Hems, and designed by Mr. Medley Fulford, have just been placed in St. Sidwell's Church, Exeter.

A large clock, with Cambridge chimes, was completed last week in the parish church of Powerstock, Dorsetshire, of which Archdeacon Sanctuary is rector. Mrs. Sanctuary formally started the clock. It has two 5ft. dials, and is fitted with all the latest improvements brought out by the makers, John Smith and Sons, Midland Clock Works, Derby.

The whole of the red terracotta work for the exterior of the New Victoria Courts at Birmingham, under Messrs. Aston Webb and Ingress Bell, has been placed in the hands of Mr. J. C. Edwards, of Ruabon. This, and Mr. Waterhouse's New Royal Infirmary in course of erection at Liverpool, also intrusted to the same firm, together with the Constitutional Club in Northumberland-avenue, will form the three largest and most important terracotta works of recent years.



A new Congregational Chapel at Marple Bridge, built at a cost of over £2,000 from the designs of Messrs. Barker and Ellis, architects, Manchester, was opened on Friday.

Premier Buildings: Islington.

"RELEASE OF BARABBAS."—MANOR HOUSE, BRAMPTON, HUNTS.—THE "COCK" TAVERN, SHAFTESBURY AVENUE.—PREMIER BUILDINGS, ISLINGTON.—CONSERVATIVE CLUB, SCARBOROUGH.—NEW STABLING, DRAYTON MEWS.

OUR LITHOGRAPHIC ILLUSTRATIONS.

"THE RELEASE OF BARABBAS."

In this large terracotta panel, by George Tinworth, Pilate, who occupies the centre of the piece, is pronouncing sentence on our Lord, who is delivered to be crucified, and is being led away bound by the soldiers in attendance. Directly behind the Saviour, the Virgin Mary and the Apostle John appear as spectators, together with some of their friends. A Roman officer is speaking to another spectator on the left of St. John, and on the extreme right, the Apostle Peter, in an agony of remorse, is restrained from approaching the Lord by another soldier. On the right and left of Pilate are attendants, holding the water and towel that he may wash his hands, and so disown complicity in the guilt of what he has done, while Pilate's wife, with a Roman companion, stands behind. On the left, Barabbas is released, amid the congratulations of the bystanders; and persons of various nationalities appear behind. To the left is a Roman watchman, denoted by the bells upon his dress; and a negro is attempting to speak to Barabbas, and is addressing a soldier with a view to obtaining the desired interview. The place of the trial is set forth by the architectural embellishments in the background, and a broken vessel and a fallen capital in front are introduced as symbolising the decay of the old dispensation. A palm branch is lying on the ground, recalling to memory the recent triumphal entry of the Lord into Jerusalem. The makers of the panel are Messrs. Doulton and Co., Lambeth.

MANOR HOUSE, BRAMPTON, HUNTINGDON.

This picturesque and interesting old mansion house no longer exists; it has been demolished to make way for a new residence, which bears the original name. The loss of such a unique specimen of plaster work is indeed much to be regretted; but inasmuch as the old house has once and for ever been improved out of existence, words are but wasted in recounting its loss. Some efforts were made, we believe, to save it, but without success. The four views herewith published to-day afford an accurate record of the building, with its quaintly gabled façades and elaborated "rough cast" masonry, massive central chimney stalk, and projecting oriel bays. The history of the house is chiefly comprised within the family records of the Burnabys, who have owned the manor for about three centuries, "The Burnabys of Brampton" being the description given in Burke and other like works concerning this notable family. The present owner of the estates is Mr. T. F. A. Burnaby, an uncle of the famous soldier. He inherited the place from his uncle, Dr. Sherard Beaumont Burnaby, Vicar-General of the Province of Canterbury, who succeeded his father, the Venerable Archdeacon Burnaby, D.D., of Leicester, and Vicar of Greenwich. He in turn succeeded his father and grandfather. The deeds relating to the property contain no specific description of the old house, which, however, is mentioned by Dickens in one of his works. Before it was pulled down the building was permitted to fall into a sadly neglected condition, and a few balusters alone remain now from the ruins of this historic manor house. Students of our old English Domestic architecture need scarcely be reminded of the once favourite practice among house-builders of using "rough cast," made of lime, hair, and coarse sand or small pebbles, sometimes studded with fragments of glass, for the external finishings of the gables and plasterings between the framings of half-timbered buildings. The elaboration of such work with shields, scrolls, and swags is often met with, as at Ipswich and Lavenham, for example, in the Eastern Counties. In Essex, also, plaster rendering was employed at Layer Marney Hall, among other places, and again in Kent, as at Rochester and Maidstone, where there still remain some good specimens. The most remarkable example, however, of enriched plaster work of which Maidstone could boast was Bliss House in the High-street, which was pulled down about six years ago. An illustration of this building appeared in the BUILDING NEWS for April 7, 1882. In Oxfordshire, at Banbury, there are some plastered fronts, with simple treatments, more or less in imitation of masonry; while other instances occur to us at Newark particularly, and also at Worcester, Ledbury, Hereford, and Norwich, and, besides these, in Cheshire and Lancashire several others could be noted, such as Moreton Hall, Holford Hall, Rufford Old Hall, Astley Hall, Aldington Hall, Smithells Hall, Carden Hall, near Broxton, Tonge Hall, and Standish Hall, near Wigan. Shropshire also furnishes not a few specimens of the kind referred to, and Warwick figures in our sketch books with others. But nowhere do we remember in England to have seen a house corresponding exactly with Brampton Manor House in the treatment of its plaster work. The Egyptians, Greeks, and Romans, as everybody knows, plastered the walls of their buildings, and we still have examples in England of Saxon and Norman work incrusted with plaster, such as Little Braxted Church, Essex, where a thin layer of fine plaster, ⅛in. thick only, was used over the rubble walls to keep out the weather. The moulded brick windows in the churches of the 15th century were often plastered to resemble stone, and good plastering between moulded ribs in imitation of vaulting is seen in some Second Pointed work, as at Rochester Cathedral. The grange or manor farm, the residence of the inferior gentry in the 15th century, is exemplified in the Grange, at Whalley, Lancashire. The ceilings of the Tudor period, which were followed by the elaborated and sometimes panelled work of the days of the Stuarts, afford endless examples of rich and beautiful design, executed in plaster, like the ceilings at South Wraxall, Wilts; the Feathers Hotel, Ludlow; the animal friezes at Hardwick Hall, Derbyshire; the old houses at Great Yarmouth; St. John's Church, Leeds; the Library at Blickling Hall, Norfolk; or at Knole, in Kent. Much of this work was due to the Italian masters preceding Buonarroti and Raffaello, whose pupils followed their lighter style, while ceilings of another manner were introduced by Italians employed by Le Pautre and Gibbs. This plaster decoration was worked by hand, and lingered in England in buildings erected by Stuart, Adam, Chambers, and Wyatt, until the beginning of the present century, when the plasterer's art gave way to castings and applied ornament. In Dublin much beautiful plaster work was still carried out during another quarter of a century. Italy first revived the use of plaster and stucco, then France, and next England. Now every domestic or public building of any pretensions to architectural importance furnishes instances of its extensive and, generally speaking, satisfactory use. Of external treatments in London we may name among the earlier instances the gables and oriels of New Zealand Chambers, by Mr. Norman Shaw, R.A., Mr. Philip Webb's works, and Mr. T. E. Collcutt's façade in Fleet-street, for Messrs. Collinson and Lock. Near Windsor the late Mr. F. P. Cockerell erected a large house in concrete, which he very cleverly finished in plaster; and the Royal College of Music at South Kensington, though shockingly ugly in general outline, is a remarkable instance of the extensive use of elaborated plaster by Lieut. Cole. The frieze of the Albert Hall, too, should be mentioned. Mr. Penrose, in the Choir Schools, which he built for St. Paul's Cathedral, in Knightrider-street, has shown how ornament in stucco may be carried out; and at the South Kensington Museum, behind the science schools, other sgraffito work is to be seen, as well as at All Saints, Winkleigh, and in Downe, St. Mary's Church, Devonshire, or St. Catherine's Church, in Savernake Forest, near Marlborough. Scratch work of a ruder kind was frequently employed by the old builders in Sussex, as at Ditchling, Lewes, and Pevensey. At Brampton the treatment of the plaster is mainly confined to an imitation of rusticated masonry.

THE "COCK" TAVERN, SHAFTESBURY-AVENUE.

This building, which is one of the earliest erected in Shaftesbury-avenue, replaces a former tavern on nearly the same site. The front is executed in red Corsehill stone and T.L.B. bricks, supplied by Messrs. T. Lawrence and Son, of Bracknell, rubbed and gauged, and the gable is richly carved in bold relief. Messrs. W. Oldrey and Co. were the builders, and the works were carried out under the superintendence of the architects, Messrs. Wylson and Long, of 21, King William-street, Strand.

PREMIER BUILDINGS, ISLINGTON.

This large and commodious block of dwellings for the working classes, which is now rapidly approaching completion, has been erected upon one of the sites prepared by the Metropolitan Board of Works for buildings of this description. It is situated in Waterloo-terrace, near its junction with Upper-street, and within a stone's throw of the Vestry Hall. The principal elevation is of brick. Bright yellow stocks form the basis of the design, and the bays, piers, cornices, aprons, &c., are of red brick, of which a very considerable portion is gauged work. All the rubbing bricks have been supplied by Messrs. T. Lawrence and Sons, of Bracknell, Berkshire. Each tenement consists of entrance lobby, two bedrooms, living room, wash-house, and w.c., and is provided with large food cupboard ventilated into the open air, coal-bunker cupboards, copper, sink with drip-board, dust shoot, &c. The roof is flat, and has been covered with asphalte. Each staircase leads directly on to the roof, which will be utilised for drying areas, as well as a recreation space for children. The sanitary arrangements have been very carefully considered, and the system advocated by Captain Papier has been adopted, by means of which the soil-pipes are utilised for inlet shafts, the exhaust being from other pipes carried up from the last inspection chamber. The advantage of this system is obvious, as it will at once be seen that the current of air which is continually passing through the pipes has not to contend against continual obstructions from water and soil rushing in the opposite direction, as is the case where the soil-pipes do duty for exhausts. The whole of the works have been executed by the owner, Mr. J. H. Mollett, under the personal supervision and direction of the architect, Mr. Henry W. Dobb, of 110, London Wall, E.C.

SCARBOROUGH CONSTITUTIONAL CLUB.

We understand the erection of the above building has been in contemplation for several years, the company's premises having for a long time having proved too limited for the number of members; but it has only recently taken practical shape, when five or six months back designs were advertised for by the directors, with the result that out of over 100 sets of plans submitted, those by Mr. Cheers, of Twickenham (which we illustrate to-day), were selected. Considerable additions have been made to the original plans, in enlarging the rooms and the height throughout, though the general arrangement is still kept almost precisely the same as in the competition set of drawings. The works are to be proceeded with at once, Lord Londesborough laying the foundation-stone early next month.

NEW STABLING, DRAYTON MEWS, S.W.

These stables have been arranged to meet the requirements of the occupiers, and to harmo-

nise with the adjacent new residences in Drayton-gardens. The upper floor, in each case, being used for dwelling purposes, is completely cut off from the stables, having a separate staircase and entrance from the mews. A stable-helper's bedroom and forage store are also provided upstairs. Special attention has been given to the drainage and ventilating arrangements, the foul-air shafts being collected and carried up with the central chimney stack. The walls are faced with Acton red bricks, and the roofs covered with Broseley tiles; the stalls and boxes are laid with the St. Pancras Company's grooved Staffordshire bricks, and have stall divisions and other fittings by the same company. The structural work is by Messrs. Warren and Bates, of Stevenage, and the plumbing and internal finishing by Messrs. Knight and Co., of South Kensington. The architect is Mr. H. Phelps Drew, of 99, Gloucester-road, South Kensington.

CHIPS.

A drinking-fountain was unveiled in the Public Park, Dunfermline, on Saturday. It has been executed from a design by Mr. Robert Cameron, Assoc.S.A., 20, George-street, Edinburgh, selected in competition, by Messrs. J. Whitehead and Sons (who carry on the sculptor work of Messrs. John Fraser and Son), Aberdeen and Westminster, London. The fountain is square, with bevelled corners, and stands on an octagon foundation of dressed Aberdeen granite. The four-sided pyramidal mass above the four basins ends in a finial, the lower part formed of granite, and the upper consisting of a bronze lion rampant, bearing a bronze shield with the Dunfermline arms. The entire height of the structure is 16ft. 8in. With the exception of the foundation work and finial, the fountain is formed of polished Peterhead granite.

The water from the Wakefield Corporation's new works at Rushworth Moors was formally turned into a large reservoir at Ardsley on Friday. The works have been carried out from designs by, and under the supervision of, Mr. Rolfe, C.E., of Leeds.

The Mayor of Oxford inaugurated, on the 20th inst., the new aqueduct which has been constructed for the improvement of the water supply of Oxford. The new system, by which water is brought through pipes from the Thames above Oxford for four miles, will provide for four million gallons per day, delivered into the lake, or a direct supply of two and a half million gallons, more than double the quantity required for present needs. Mr. Hawksley is the engineer of the works.

The statue of the late Mr. Samuel Morley, at Bristol, was unveiled on Saturday. It stands on a granite pedestal near Bristol Bridge. The statue is of Sicilian marble, and is 8ft. in height. It is the work of Mr. Havard Thomas, and the polished granite pedestal, which is 11ft. in height, was provided and erected by Messrs. Arthur Lee and Brothers, of Canon's Marsh, Bristol.

The last stage in the restoration of St. Peter's Church, Nottingham, which has been in progress in sections for the past ten years, has now been reached, and the edifice has been reopened. The present works cost £2,000, and include the replacement of the high pews by oaken seats, erection of inner north porch and screen in the tower archway, both of oak, and new pulpit, lectern, and heating apparatus.

The foundation stone of the new infirmary which is to be erected in Liverpool from designs of Mr. Waterhouse, R.A., and which promises to be one of the most imposing Gothic structures in that city, will be laid to-morrow (Saturday) by the Earl of Derby. We illustrated and fully described the building, which will contain 290 beds, in our issue of the 1st July last.

The memorial stone of a new church for Strathbungo Parish, near Glasgow, was laid on Saturday afternoon. Designed by Messrs. M'Kissack and Rowan, architects, in the Transitional Norman style, the church, which will be seated for a thousand persons, is to cost some £5,500.

Out of 100 applications for the appointment of clerk of works for the outfall sewerage works at Burnham, Mr. A. E. White, of Westminster, has been elected. Mr. Henry Hill, of High Wycombe, is the contractor.

St. Bartholomew's Chapel, Sandwich, was reopened on Tuesday week after restoration, including the rebuilding of the north transept, new altar rail and steps, entire reseating the seats, as well as new oak fittings, restoration of the ancient altar screen, brass lectern, &c. The restoration has been carried out by Messrs. Wise, of Deal.

COMPETITIONS.

Indianapolis.—A competition is in progress for a soldiers' and sailors' monument, for the State of Indiana, to be erected at a cost of 200,000 dollars, on Circle Park, in the centre of the City of Indianapolis. The assessors, or experts, are—Professor W. R. Ware, of New York; Professor John L. Campbell, of Wabash College, Ind.; and Gen. T. A. Morris, of Indianapolis. The commission has invited Messrs. Richard M. Hunt, of New York; George B. Post, of New York; Van Brunt and Howe, of Boston; Cabot and Chandler, of Boston; T. P. Chandler, of Philadelphia; Burnham and Root, of Chicago; Frederick Baumann, of Chicago; Jas. W. McLaughlin, of Cincinnati; Adolph Scherrer, of Indianapolis; and Peabody and Stearns, of St. Louis, to prepare sketches for the proposed structure, for which each of those invited will be paid the sum of 200 dollars. The commission will receive and entertain designs by other architects and sculptors not so invited. Sets of five unmounted drawings, consisting of a plan, elevation, section, perspective, and plan of park, are to be delivered, flat, on or before Dec. 12 next, to the Board of Commissioners at Indianapolis. The successful architects will be paid a commission of 5 per cent. on total cost, and the competitor placed second will receive 500 dollars. Should a second competition be instituted each competitor will receive a premium of 400 dollars. A number of sets of particulars have been sent to us. Any architect can have one by sending three stamps for postage to this office.

Maynooth.—Mr. William Hague, of Dublin, has been chosen the architect for the new works at St. Patrick's College, Maynooth. This gentleman has been the architect to the college, and it seems had, previous to the competition, prepared plans for the contemplated improvements. Perhaps it was, after all, unnecessary to hold a competition, as in the Brompton Oratory scheme, seeing that the authorities had the ultimate design already before them; but of this there is no evidence before us. The work consists of finishing and furnishing the chapel with altars and stalls. The cost will be from £5,000 to £6,000.

St. Leonard's Hospital Charity, Newark.—Fifteen sets of plans were received from architects for the new almshouses to be erected at Newark, and the design under motto "Charity," by Mr. E. W. Farebrother, F.R.I.B.A., architect, Great Grimsby, has been accepted.

SCHOOLS OF ART.

Rotherham.—The committee of the Rotherham Science and Art School have followed the advice of the newly formed National Technical Education Association in seeking the counsel of an expert as to the kinds of education which they should give, in view of the special necessities of the district. Sir Henry Roscoe, M.P., who with Mr. A. H. Dyke Acland, M.P., is secretary of the association, has sent down Mr. J. H. Reynolds, secretary of the Manchester Technical School, to confer with them, and the result has been that they have come to the conclusion to build a school, making special provision for theoretical instruction in chemistry, metallurgy, and physics upon the science side, with further provision for the higher teaching of mathematics. The plans which the committee's architect had already prepared had made provision for the teaching of science subjects. They have now so amended their plans as to provide for lecture rooms for graded sets for chemistry and physics respectively, and for two distinct laboratories respectively for practical work in chemistry and metallurgy. To the chemical laboratory there will be attached a balance-room as well as a demonstrator's preparation room. The metallurgy laboratory will be fitted with appliances admitting of experiments explanatory of the fundamental processes in the reduction and testing of metals. The South Kensington Department is continually producing fresh models of laboratory fittings, and the committee are in direct communication with Professor Thorpe in that department in the hope of securing fittings of the most recent type.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Association of Public Sanitary Inspectors.—The fourth annual report of this association congratulates the members on the movement commenced during the past year for the affiliation of branches and for representation of branches upon the council of the association. These efforts will be followed very shortly by the formal enrolment and affiliation of two strong and important branches, which are already formed. One, "the North-Western District Branch," has its headquarters at Liverpool, and a membership of 52; the other, "the Midland District Branch," has its headquarters at Birmingham, and a membership of 48. This example will, it is expected, be speedily followed by the formation of other branches This gives promise of, at no distant date, a federation and representation, in one council, of all the sanitary inspectors in the kingdom, numbering nearly 2,000. The monthly meetings, which were held at the Town Hall, Westminster, during the past year (and will be continued there in future), were highly successful. The list of members now numbers 200 names, in addition to 27 honorary members, and 13 associates.

The Glasgow Institute of Architects.—The twentieth annual general meeting of the Glasgow Institute of Architects (Incorporated) was held in the Religious Institution Rooms, Glasgow, last week; Mr. David Thomson, president, in the chair. The report of the Council, which was read by Mr. William MacLean the secretary, gave an account of the work of the Institute during the year. The financial statement, submitted by Mr. T. L. Watson, showed a balance in favour of the Institute of £289 1s. 5d. The chairman congratulated the members on the flourishing state of the society. As to the proposed Registration Bill, he had attended a conference in London, and had expressed the opinion, on behalf of the Council, that they would oppose the formation of a central association in London for the regulation of all professional matters in the provinces.

Institute of Auctioneers and Surveyors.—A meeting of this recently-formed body was held at the Cannon-street Hotel on Wednesday. Mr. J. M. Klenck, chairman of the council, presided, and having reminded the members of the circumstances in which the institute was formed a year ago, stated that since the meeting at which a council was appointed nine months ago nearly 700 members had been admitted. The present meeting had been convened with the view to report to the profession generally the result of the inaugural meeting. Several members expressed their satisfaction at the progress which had been made, and a resolution was passed to the effect that the entrance-fee should be dispensed with until 1,000 members had joined.

The R.I.B.A. "Kalendar."—The "Kalendar" for 1887-8 of the Royal Institute of British Architects, like the A.A. "Brown Book," and other annuals of similar character, shows a progressive increase in bulk, and now numbers 156 pages, against 100 last year, and 80 in the issue for 1885-6. The new features in the present kalendar are four in number—the supplemental Charter recently granted to the Institute; a section on professional practice, consisting of a reprint of the Schedule of Charges, as agreed to in 1872, the Heads of Conditions of Builders' Contracts, and the Suggestions for the Conduct of Architectural Competitions; a section dealing with the Architectural Association, in which brief particulars of the various classes are given, and the "Suggestions for the Guidance of Students" are reprinted from the "Brown Book"; and lastly, information respecting the Architects' Benevolent Society. A sign of the times is that the Association meetings are announced in the almanack. The meetings for the ensuing session are as follows:—Nov. 1st (Monday week), address by the President, Mr. E. I'Anson; Nov. 21, Dec. 5 and 19, Feb. 6 and 20, March 19, April 23, May 28, and June 11 and 25, ordinary meetings for the reading and discussion of papers, the last mentioned date being the night for the presentation of the Royal Gold Medal and prizes; Jan. 16 and 23, March 5, April 9, and May 7 (the annual meeting) are

meetings for business purposes only. The list of members shows a total of 1,266, made up of 13 Hon. Fellows, 428 Fellows, 89 Hon. Associates, 681 Associates, 52 Hon. Corresponding Members, and 3 Hon. Members. At the corresponding period last year the total, by a curious coincidence, was precisely the same, the change in the relative proportion of classes being that there are now nine more Fellows, while the numbers of Hon. Associates and Associates have decreased by one and eight respectively. Two years ago, at the commencement of the session 1885-6, the list of members numbered 1,259 names, of whom the Fellows enumerated 404 and the Associates 694. The change in the relative proportions of Associates and Fellows is evidently due to the fact that admission to the former class is only to be gained by passing an examination, which will not be obligatory on Fellows until five years after the granting of the Supplementary Charter.

CHIPS.

On Saturday, at the village of Eastgate, Weardale, the foundation-stone of a new church was laid by its founder, Mr. Hildyard. This church has been designed by Messrs. Austin and Johnson, architects, of Newcastle, and Mr. Ralph Sanderson, of Durham, is the sole contractor. Its cost will be about £5,000.

Mr. J. Oldrid Scott informs us that the Union Building at Glasgow University has not been built from his designs, as stated by us last week.

The first of a series of lectures on Plumbing and Sanitation, in connection with the Edinburgh College of Science and Technology, was delivered on Friday night in the Central Chambers, 21, St. Andrew-square, Edinburgh, by Mr. Thomas R. Proctor, president of the Master Plumbers' Association. There was a good attendance of young men belonging to the plumbing trade. Mr. Walter Brodie occupied the chair.

A new Liberal Club is in course of erection in Clifford-street, York, from plans by Mr. W. G. Penty, of that city.

The memorial window at Upton Pyne Church, erected in memory of the late Lord Iddesleigh by parishioners and residents of Exeter and the county, was formally presented to the rector and churchwardens on Saturday. The window is one of three lights, the first depicting Moses giving the Ten Commandments; the second, our Saviour on the Mount; and the third, St. Paul preaching at Athens. In the wall near by has been placed a brass tablet, bearing an inscription. The window was the work of Mr. Drake, of the Cathedral-yard, Exeter, and the brass tablet was provided by Messrs. Wippell Bros. and Rowe.

Shipton Moyne parish church, Gloucestershire, has just been fitted with a clock, as a Jubilee memorial. It has an engraved slate dial 4ft. 6in. diameter, and strikes the hours. Messrs. John Smith and Sons, Midland Clock Works, Derby, carried out the work.

A stained-glass window is about to be placed in the organ transept of St. Andrew's Cathedral, Inverness, to the memory of the late Mr. Alfred Denison, of Ness Side House. The window, which is to cost £500, is the gift of Sir Walter Phillimore, Q.C., M.P., a nephew of the deceased.

Last Friday, Mr. John Grundy, of 30, Duncan-terrace, City-road, London, gave his annual treat to the aged of his native town, Tyldesley, near Manchester, at which place his extensive heating apparatus foundry is located. More than 600 persons whose ages were 60 years and upwards sat down to a very substantial repast. The whole of the guests afterwards repaired to the large assembly-hall of the Conservative Club, where a most enjoyable evening was spent—an excellent concert being given, which was interspersed with short addresses. The chair was occupied by Mr. W. Ramsden, J.P., and a great many of the *élite* of the town were present. For the very aged and infirm, Mr. Grundy had thoughtfully provided conveyances to fetch and take to their homes.

The Leland Club, a branch of the British Archæological Association, visited Rochester on Monday week. They were met by Mr. Roach Smith, F.S.A., and taken to the Cathedral and Castle, after which they drove out to Kits Coty House, which Mr. Roach Smith described as probably from 2,000 to 4,000 years old, and the burial place of some chief or petty king. He believed it was originally covered with earth, as no doubt had also been the fallen and larger cromlech at the foot of the hill. Mr. George Wright, F.S.A., agreed with Mr. Roach Smith's remarks. Subsequently the party inspected Restoration House, Rochester, where Mr. Stephen Aveling, the owner, cordially received them.

Building Intelligence.

ACTON GREEN.—The memorial stone of the Church of St. Alban the Martyr, Acton-green, was laid on Tuesday, October 18. It will consist of nave and chancel, with north and south aisles, vestry, and organ-chamber, with heating-vault under morning-chapel, 12ft. by 29ft.; a semi-octagonal baptistery, 20ft. by 10ft.; two porches at the west end; and an entrance at the north-east corner of the nave. There will also be a lofty clerestory on an arcading of five brick arches springing from quatrefoil columns, and the height from floor to ridge of nave will be 55ft. The building is to be in the Early English style, and is being carried out from a design and under the personal superintendence of Mr. Edward Monson, jun., A.R.I.B.A., of The Vale, Acton, W. The walls are to be built of brick, faced externally and internally with best red local bricks, with dressings of Bath stone and blue Staffordshire brick bands. The cost of the building, including seating, lighting, and warming arrangements, is estimated at £5,000; but it is only intended at present to erect the nave, aisles, and baptistery, and to inclose the site with a substantial brick wall, and the contract for this has been taken for the sum of £3,500 by Mr. Joseph Dorey, of Old Brentford.

CHOBHAM, SURREY.—The council of the Gordon Boys' Home visited Chobham, near Brookwood station, Surrey, on Wednesday, to inspect the new buildings which will be complete by the end of the year. The buildings, which are of red brick picked out with Bath stone, are built from designs by Mr. W. Butterfield, the honorary architect. On the southern side of the parade ground, which measures about 750ft. by 150ft., stands the dining-hall, flanked on either side by two buildings containing the dormitories. These are all detached. The dining-hall is a double-gabled building, with an interior measurement of 64ft. by 24ft., and will admit of extension should the necessity arise. On one side of the entrance is the instructors' mess-room, and on the other side a writing and recreation room for the boys. The four dormitory buildings each consist of two floors, with two dormitories of 20 beds in each, affording in all sleeping accommodation for 160 boys. These rooms are fitted at each end with ventilating fireplaces of the ordinary barrack pattern. Between the two rooms on each floor is an inspection room for a sergeant. The northern side of the parade ground is occupied by workshops and offices. These include ablution rooms, carpenters' shop, smiths' shop with double forge, quartermaster's store, laundry and bath-room, bakehouse with steam oven, kitchen, guard room with cells, the commandant's and adjutant's offices, shoemakers' and tailors' shop, and schoolroom. The whole of the parade ground is surrounded by a brick wall, outside which are the commandant's and staff-officer's quarters and two five-roomed cottages for the instructors. There is also a hospital in course of erection. The cost of the building will amount, roughly speaking, to about £12,000.

EDINBURGH.—Sir James Gowans, in retiring from the office of Lord Dean of Guild, gave an address on Friday concerning the work done in his Court during the past year, remarking that it might be regarded as an index of the state of the building trade of the city, and indeed of trade generally. It showed the direction and extent of the city's progress and the provision that was being made in the way of dwelling-houses for the various classes of society, from the poorest upwards. During the official year now ended there had been 539 applications presented to the Dean of Guild Court, and in 508 of these cases warrant was granted. The number of applications made this year exceeded last year by 48, and the number of warrants granted exceeded last year by 117. Of the more important public buildings sanctioned during the year, mention might be made of Heriot-Watt College, the Warrender Private Baths, and board schools in Torphichen-street, Castle-hill, and East London-street. In connection with the inspection and testing of sanitary arrangements, he expressed the hope that the present movement for the registration of plumbers would be carried through successfully. The institution of a proper board of examiners in Edinburgh would go far to purge the craft of the non-efficient hangers-on. He mentioned what he considered a defect in the Police Act—namely, that the Dean of Guild Court had no control over the architectural appearance of the building. Such a power, wisely exercised, would undoubtedly tend to the beautifying of the city. Another weakness in their powers was that they could not control the use of materials. This led to the mixing up of brick and stone in the exterior of buildings exposed to view, which was gradually tending to such erections having a patched appearance. They had to regret the absence of powers for insisting on the subdivision of houses and flats into small houses. In many such cases the arrangements as regards sanitary conveniences, light, and air space were of the most insufficient kind. The building up of already insufficient open ground was a highly reprehensible practice, and required to be prevented by law. The education of the people as to the value of well-built, healthy houses would do more to force on the erection of complete dwellings than the intervention of the local authority, or even Parliament.

IPSWICH.—The foundation-stone of the Edward Grimwade Memorial Chapel in the Back Hamlet was laid on the 20th inst. The chapel will replace a smaller one, built in 1872, on the opposite side of the road, which will be converted into a lecture hall. The new chapel, which will be 70ft. long by 50ft. wide, and nearly 50ft. high, will run from east to west. It is to be Gothic in style, of red brick, with slated roof, and will accommodate 800 people. The main entrance will be from the west end of the south side, by the side of which there will be a second entrance leading up, through a small red brick tower with hipped roof, to the gallery. The west gable is occupied by a five-light window, flanked by a pinnacled buttress on each side. Six windows will light the north and four the south side, the window sills being in each case of weather-bed Ancaster stone in relief to the red brick. The Æolus water spray ventilating apparatus will be employed, and the chapel will be lighted with sunburners. The contract has been signed for £2,600, which will include the benching. This will be throughout of pitch pine. Mr. William Eade, of Ipswich, is the architect, and Mr. Frederick Bennett, of the same town, the builder.

KENDAL.—The foundation-stone of the new Grammar School was laid on the 20th inst. on the new site in Lound-road. The style adopted is a Scholastic type of Gothic, and the building will be faced with local limestone rubble, with ashlar dressings of Prudham freestone, and the roofs will be covered with green Tilberthwaite slates. The chief rooms are the assembly hall, 50ft. by 32ft. and 28ft. high to open timber roof of pitch-pine; school library, 23ft. by 14ft.; numerous classrooms on the ground and first floors, varying from 29ft. by 21ft. to 21ft. square, while suites of apartments are provided for the head and assistant masters. The chief contractors are: Mr. W. Dixon, mason, and Messrs. Thomas Thwaites and Son, carpenters and joiners. The designs were selected in competition, and are by Mr. Stephen Shaw, Kendal.

PLYMOUTH.—The consecration of St. Matthias' Church took place on Tuesday. The building is in the Perpendicular style, and consists of nave, north and south aisles and porches, chancel, with vestry and organ chamber, and tower at the west end of the nave. The tower, about 120ft. high from the pavement to the top of the pinnacles, is of the Somersetshire type, with long belfry windows on the four sides filled with open traceried work, and is terminated by an embattled parapet with crocketed corner pinnacles, and smaller intermediate ones. The nave has five bays of four-centres of Bath stone, springing from moulded piers, and columns with red Mansfield shafts and Bath stone moulded caps and bases, and is lit by traceried square-headed clerestory windows. The side aisles have three-light traceried windows alternated in design. The roof of the nave and chancel (of oak and pitch-pine) are of hammer-beam construction. In the chancel the trusses are borne by angels, sculptured in stone, with outspread wings, and playing various musical instruments. These have been carved by Mr. Hems, of Exeter, who also executed the

carving in pews, stalls, font, and pulpit. The wrought-iron altar standards, gas brackets, front gates, and lamps are by Messrs. Singer and Sons, of Frome. The building is erected of Plymouth limestone, lined with Horrabridge brick, the dressings and moulded and traceried parts being chiefly of Box Ground and Monks Park stone, Portland stone being employed for the more exposed parts, such as copings, battlements, and pinnacles. The church has been erected from the designs and drawings of Messrs. Hine and Odgers, by Messrs. Finch and Son, of Plymouth. Mr. Waymouth has been the clerk of the works.

Sunderland.—The foundation-stone of a new church dedicated to St. Ignatius, the gift of the Bishop of Durham, was laid on Tuesday, at Hendon, Sunderland. The church is Early English in style, with tower and spire at south-west corner of nave, and built entirely of stone. There will be sittings for 720, and will cost about £8,000 exclusive of site. Mr. C. Hodgson Fowler, M.A., F.S.A., of Durham, is the architect; Mr. Howe, of Hartlepool, the contractor, and Mr. S. Carse clerk of works.

Windermere. — The new cemetery, provided for the use of the parish of St. Mary Applethwaite, was opened on Tuesday last by a portion of the ground being consecrated by the Bishop of Carlisle. The church is of the Perpendicular style, built of the local slate, and freestone dressings, having a five-light traceried window at the east end and a three-light window of a similar character at the west end, with four single-light windows at the sides. A lodge is provided for the caretaker, which is of a Late Domestic character, with half-timbered gables and lead lights to windows. The entrance gateway is of freestone, having moulded splayed pillars and wing walls, with wrought-iron gates and railing. The work has been done by local contractors, from the design, and under the superintence of, Mr. Robert Walker, architect and surveyor, Windermere.

CHIPS.

A Local Government inquiry was held at Burnley on Friday, into the application by the town council to borrow £69,000. An additional £50,000 is required for completing the new reservoir at Cant Clough, £10,000 for the town hall, and £9,000 for enlarging the cemetery.

At a meeting of the Dundee Police Commissioners on Friday tenders were submitted from contractors from all parts of Scotland for the works in connection with the extension of Dundee esplanade. The burgh surveyor had estimated the cost of the works at £20,000, and the tenders ranged from £15,200 to between £25,000 and £30,000. The works include the extension of the present esplanade about a quarter of a mile, the construction of a bridge over the railway line, and a new bathing pond. The commissioners resolved, before arriving at any final decision in regard to the tenders, to allow the electors to express their opinions at the ward meetings.

Mr. Daniel Watney, of the firm of Messrs. Daniel Watney and Sons, 33, Poultry, E.C., has been elected to the post of surveyor to the Mercers' Company, rendered vacant by the death of the late Mr. George Barnes Williams.

The new building for the Keighley Technical Institute, which has cost about £12,000, was formally opened on the 14th inst. by the Earl of Rosebery. The architects were Messrs. W. and R. Mawson, of Bradford; Messrs. Sewell and Co., of London-road, St. Alban's, did the carving.

The little church of St. Petrock, Hollacombe, Devon, was reopened on Monday, after having been rebuilt, with the exception of the tower. The old church was very dilapidated—so much so that the walls and roof were unsafe. The old porch and font—fine specimens of Norman architecture, remain. The seats are open benches of pitch-pine, and the floors are laid with Maw's tiles. The carving of the chancel ceiling and oak altar standards was executed by Mr. Northcott, of Ashwater. The glazing is by Messrs. Beer and Driffield, of Exeter. Mr. Hooper, of Hatherleigh, was the architect for the restoration.

A Local Government Board inquiry was held at Eastbourne on Wednesday in connection with an application for a new loan of £11,500 for a sea front and street improvements. Some ratepayers complained that during recent years no less than £170,000 had been expended in the development of the town. Mr. Harrison, the inspector, reminded them that Eastbourne's repute as a watering place called for a large expenditure.

Engineering Notes.

Liverpool Engineering Society.—The usual fortnightly meeting of this Society was held at the Royal Institution, Colquitt-street, Liverpool, on Wednesday, October 19th, Mr. John J. Webster, M.Inst.C.E., President, in the chair. A paper by Mr. C. Harrison Townsend, entitled "Ornament and Design, their Relation and Subordination in Engineering Works," was read by the author. The author commenced by defining the words forming the subject matter of his paper. He half apologised, speaking as he did to engineers for adopting Mr. Ruskin's definitions of architecture and building. He thought they covered the ground, and begged no controversial question. He proposed to illustrate the conclusions he had arrived at by two specimen pieces of work, intrusted severally to the engineer and the architect. He instanced the line of thought which would pass through the engineer's mind when intrusted with the design and construction of a viaduct across a valley, and by diagrams illustrated the probable outcome of his design. The result of such a piece of engineering work, though nowadays often pleasing to the eye and taste, he was unwilling to give the engineer credit for. The mellowing touch of time and nature's beautiful surroundings were to be thanked for what we now admire in the aqueduct across the Campagna as well as in certain modern railway viaducts he instanced. As opposed to the engineer's work, he imagined an architect and his process of design when treating, say, a cathedral. The requirements were many, and all these first of all had to be met. The simple building of a series of unconnected parallelograms, in fact, would meet material wants; but the true architect is not satisfied with this. He insists that every part of his building, from lofty roof to carved boss, should be pregnant with meaning, and with a message to man. All architecture is charged with something "to say," and even bad architecture that tries thus to speak, but utters nothing coherent nor really of service to man, is in so far better than the work (skilfully constructed though it may be) of him who builds, "and there an end on't." The lecturer showed by diagrams how "thought" on his designer's part, and interest in the spectator's mind, underlie even the simplest detail of a true architectural building. He concluded by pleading that from the savage, with his painted birch canoe, upward throughout the human race there was a desire for beauty, and pointed out that his strictures had been directed against such works of the civil engineer as palpably, and in many cases wilfully, disdained this need in man.

Considerable progress has been made in the erection of the Victoria Courts, at Birmingham, of which Messrs. Aston Webb and Ingress Bell, of London, are the architects. The site has been excavated, and about half of the foundations have been laid. The brickwork rests upon beds of concrete, of varying thickness, according to the character of the ground. The operations of Mr. J. Bowen, the builder, have been going on since the end of June last, and at present seventy-five men are employed on the work. The work will be continued, as far as the weather permits, through the winter. It is expected that the entire work of erecting and fitting the courts will take three years. The terracotta for the external parts of the building will be supplied by Mr. Edwards, of Ruabon, and that for the interior by Messrs. Gibbs and Canning, of Tamworth.

The restoration of Walesby Church is now complete. The work has cost between £1,100 and £1,200. In October, 1886, the nave and aisles, having been rebuilt and furnished with modern oak fittings, were reopened; but the chancel was then left practically untouched for lack of funds, a defect which interfered seriously with the harmony of the whole. Sir John Savile has, however, succeeded to the Rufford estate, and undertook, at his own cost, the restoration of the chancel. The architect was Mr. G. H. Fowler, F.S.A., of Durham, and the builder was Mr. Rudd, of Grantham.

The opening meeting of the Geologists' Association of London will be held on Friday evening in next week, in the Library of University College, Gower-street, when an address will be given, entitled "Fifty Years' Progress in British Geology," by Mr. F. W. Rudler, F.G.S., president of the association.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, STRAND, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All Drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 8s. 8d. (or 7dols. 30c. gold). To France or Belgium, £1 8s. 8d. (or 36fr. 80c.) To India (viâ Brindisi), £1 17s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 10s. 10d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., and LI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cases for binding the half-yearly volumes, 2s. each. Reading cases 2s. each.

PROVIDENT FUND FOR ARCHITECTS' ASSISTANTS.

To the Editor of the Building News.

Sir,—It is satisfactory to notice that the question of a provident fund for assistants has interested some of your readers. This, however, is not the place to discuss the details of a scheme. The next thing to be done is to bring together those who are likely to actively promote the undertaking, and when the assistants show that they are really in earnest, perhaps the organised bodies of the profession will help them. Will, therefore, those who are anxious to prove their earnestness write to me to the Building News Office, putting into practical form any suggestions that they may have to make, and also stating their willingness to attend a meeting to discuss the matter? A room can probably be secured in a central position, free of cost, for this purpose.—I am, &c.,

Provident.

Sir,—I am very pleased to see the suggestion made to form a fund to aid poor struggling assistants in a time of need, and cannot see but that it ought to be carried forward to success. If carried out somewhat upon the lines suggested by "Hopeful" in your last issue, I think it must commend itself to all.

May I suggest that its sphere be extended, so as to embrace assistants in the country? Throughout the provinces there must be a very large number of assistants, many of whom I feel sure would be very pleased to join, if they could have equal benefits, and be represented upon the management. Would it not be possible to have representatives or local secretaries in all centres? Surely someone would volunteer for

such a laudable cause! I would, for one. I would suggest to those who take the initiative that they should communicate with the various architectural societies, where existing, and with members of the R.I.B.A. where not. Through these two sources I think they would be able to reach most of the assistants. I heartily wish the movement God speed.—I am, &c., L. C.

THE FUTURE OF THE ARCHITECT.

Sir,—Lord Shaftesbury said, "If the Church of England fall—and it will be the darkest day that England ever saw when she does—it will not be from the severity of the attack, but from the weakness of the defence," and I venture to assert that if the position of the architect is so weakened that the public arrive at the conclusion that he may be dispensed with, it will be because he has allowed misstatements by those interested in his downfall, to pass uncontradicted and unexplained.

It may be that I take a pessimist view of the future of the British architect; but I know that he is losing ground every day; that very large and important works, as well as those smaller works of alterations and additions, which are so useful to the young architect, are now intrusted solely to the care of the builder without the aid of the architect. I also know that this state of things has been brought about principally by the iteration and reiteration by the builder that the architect is "not practical," and can only make pretty sketches of costly and uncomfortable houses; and, to some extent, by a system in considerable force in the architectural profession, which has nevertheless given colour to those misstatements which have been allowed to propagate without contradiction or explanation. It would not be well, reading between the lines, to disregard the decision of the Corporation of the City of London to deprive itself of the services of an "architect" (in place of the late Sir Horace Jones), and to employ a "surveyor" at the ruinous salary of £800 per annum, and I take the decision to be one which supports my statement that the architect is losing ground. It is also worthy of note that Wormwood Scrubbs Convict Prison and Chapel are being designed and carried out without the aid of an architect.

Fortified by the success which has attended the builder's efforts to oust the architect, that interesting specimen of a day's growth, the "Professor of Sanitation" has indulged in the little game, and by iteration and reiteration *he* has succeeded in impressing the public with the idea that architects are utterly ignorant of drainage and sanitary matters, and so architects have lost, and are losing, not only the sanitary works, but many incidental works which arise out of them, and further is the idea spread that architects are not practical. In the correspondence, which I herewith transmit, it will be seen that I have considered Professor Corfield as one who is taking away the legitimate work of the architect, and, so far as in me lies, I have endeavoured to prove that he, and not the architect, is unable to design and specify the working items of drainage and sanitation. Of course, the Professor does not like the idea of sitting with me in an empty room to prove that he is unable to take the place of the architect; but, nevertheless, he and his brother "Professors of Sanitation" are getting the architect's work, and the architect is losing that and reputation at the same time. In his last letter Professor Corfield quotes, with some force, the letter which Mr. H. R. Gough wrote to the *Times* on the 1st inst., in which the statement of the Professor as to the ignorance of architects in sanitary matters was endorsed. But I now challenge Mr. Gough to prove his statement, and until he does so I shall conclude that it was one having for its object not, I trust, the injury of the profession in the eyes of the public, but the furtherance of the aims of that young Society of which he may be said to be a corner-stone.

But why should it be left to one or two members of the profession to defend it from these serious attacks on its skill and reputation? Where is that "one and only true representative body," the only powerful defender of our interests? Echo answers, Where? Last week only, as if suddenly awoke from that lethargic torpor which sometimes distinguishes it from kindred institutions, the R.I.B.A., in a letter to the *Times*, expressed its views on the proposed removal of the Strand Church, a subject which had been fully discussed, and apparently settled, ages ago. The Institute, with 50 years of tradition at its back, remained somnolent when Mr. Butterfield proposed to cut in half the portico of St. Martin's Church. Notwithstanding that it takes credit to its Council for securing the opening up of Charing-cross into the Mall, that Council failed to take advantage of the announcement that the Government had made provision for that opening in its estimates for the extra accommodation to be provided for the Admiralty and War Offices. The open space of Piccadilly-circus might have been lost for ever for aught the R.I.B.A. cared. Professor Corfield was allowed to bring architects into contempt so far as an important branch of their business is concerned, and the "only representative body" remained quiescent. Mr. Gough has been permitted to make a general statement in the columns of the *Times*, which may or may not have a foundation in fact, but which has naturally been laid hold of by Professor Corfield as a warrant for the statement which I had ventured to contradict, and which must, coming from a Fellow of the Institute, tend to confirm that opinion, which it is, to my mind, momentous should be eradicated, and yet, so far as I am aware, the Council of the Institute have not called upon Mr. Gough for either a confirmation or withdrawal of so damaging a statement.

I have excellent grounds for believing that architects are in need of a strong protective association. I am convinced that if we allow the present public feeling against architects to grow, the bread will be taken out of the mouths of our immediate successors. The R.I.B.A. is the proper recognised body to protect us in every way; but if the R.I.B.A. cannot see its way to more effectually guide public opinion, another institute must be constructed which can; for if the profession fall, it will not be so much from the severity of the attack as from the weakness of the defence.—I am, &c.,

Wm. Woodward.

7, Duke-street, Adelphi, W.C., Oct. 25.

THE ROMAN VILLA, TOCKINGTON, GLOUCESTERSHIRE.

Sir,—The so-called discovery or re-discovery came about thus: Some five years ago I was reading up "antiquities" at the British Museum Library, when I found an allusion to the site of a Roman villa only very partially uncovered, as existing about midway between Bristol and Gloucester, near the high road. It surprised me, as I thought I should have known something about it. When, three years ago, I was in the neighbourhood, I made inquiries. Neither the vicar nor the oldest inhabitant knew anything about it, and my inquiries, puzzling the bucolic mind, brought upon me suspicion and distrust. However, I persevered, and one inhabitant with a greater degree of intelligence than his fellows, informed me where he thought it most likely to be, and then I went about a mile from the village of Tockington, and assured myself it was the place referred to by the old writer, though nothing was visible that could positively be identified with the villa remains.

As the remains were supposed to be under the house yard and farm buildings, I saw no hope of exploration on my part. The visit, however, at length has produced fruitful enterprise. Whilst Roman houses are generally on slopes in high positions, the Mediæval house was most commonly in low a situation. This place at Tockington is remarkable as incorporating both periods, along with a comparatively modern house. From its remarkably isolated position, the materials of the Roman house were not worth taking away, and at a later time the materials were re-used on the same spot, some remains of this Mediæval house still being visible. Probably the modern house also was built of the same stones, though they are not identifiable. Thus a remarkable continuation of occupation has ensued.—I am, &c.,

M.

GANGWAYS v. STAIRCASES.

Sir,—If an internal staircase is to be a *sine quâ non* of a theatre or music-hall, then your correspondent seems, like Cranmer, to "have got the right sow by the ear." The merits of a suggestion may often be best discussed by considering its weakest points, and, as a building catering for the amusement of the public must necessarily be situated in a central locality, where ground rents are high and each foot of space valuable, the increased room required for a gangway may render it possibly objectionable to those directly interested, while so far again as the public are concerned, space is secondary to safety. Another objection to this system is that plats or landings are still necessary, especially in descending from the upper floors of the building. The greater impetus given by an even gradient means increased difficulty in stopping and turning at the landings, changing at the same time from an inclined plane to a flat, and then downward again. True, a spiral gangway would obviate that, but the greater space required renders it inadmissible. I have seen gangways 7 or 8ft. wide used in mills, with cross pieces in the centre, and the speed at which men ran up and down heavily laden barrows was astonishing. Then to see the hands flocking down in crowds at meal hours, with never a fall or accident, affords fairly practical test of its utility. True, at first a gangway is more tiresome to ascend than a staircase, but this is much the result of habit, and the higher one rises in a theatre the less fastidious an audience becomes.

What is first wanted is easy egress in case of panic or sudden alarm, and so far as the means of ascent or descent are concerned the gangway is safer than the stair. In descending, which is the main thing, the chance of a fall is reduced to a minimum, and without a fall or similar cause of obstruction, a block is almost unknown.

Return gangways with a solid brick newel rising from the ground, give all the elements of a stiff, solid, and perfectly fireproof construction.—I am, &c., James A. Morris.

Sir,—Will you allow me to point out an excellent application of the inclined plane instead of the staircase—viz., the Campanile of St. Mark's, Venice. It is constructed within the walls, upon the four sides of the tower, and gives a much easier access to the belfry than a staircase. There is a single step at each turn; but I do not remember the gradient of the incline, only that it is easy and pleasant. It is said that Napoleon I. rode his horse up to the top. This would be quite possible. The advantages of the inclined plane over the staircase are very great; the only disadvantage is the extra space required.—I am, &c.,

William Peachey.

Saltburn-by-the-Sea, Oct. 25.

SANITARY ASSOCIATIONS AND HOUSE DRAINAGE.

Sir,—Referring to letters which have appeared in the Building News of the 14th and 21st inst. on this subject, I shall be glad if you will allow me space for a few remarks.

Whilst giving Mr. Buchan all due credit for the good work he has accomplished in connection with sanitation, it is amusing to note the egotistical style in which he writes. He should remember that other persons can form opinions and ideas. Some of the sanitary associations have as many houses examined, &c., in 12 months as probably any "practical sanitary plumber" examines in as many years, and, as the engineer of one of these associations, I venture to think my experience is not valueless. Mr. Buchan and "Clerk of Works" advocate the use of a separate disconnecting trap on every soil-pipe and branch drain, in addition to the disconnecting trap on main drain; and also that the main drain be ventilated by a special pipe, and not by soil-pipes. I admit there are exceptional cases where it is not advisable to ventilate a main drain through a soil-pipe, such as when the latter is unavoidably inside house, or perhaps when the drain is a very long one. In most cases, however, there is not sufficient ground in the arguments adduced to justify the use of additional traps and special ventilating pipes; and to do so in short branch drains which simply serve gullies is certainly quite unnecessary.

In the first place, there is the question of expense; and I would here point out that the Sanitary Associations (unlike tradesmen or patentees) have no pecuniary interest in the

work they recommend, and therefore have no temptation to advise unnecessary appliances. Then it is one of the fundamental principles of sanitary science that, after efficiency, simplicity is all important. If we put in innumerable traps and pipes where one or two will suffice, it is impossible for the average householder to understand the drainage arrangements as he ought; and there is also greater liability of derangement. Another objection to placing a trap at the foot of a soil-pipe is that the flushing force of the water is seriously interfered with, the energy which should be used to keep drain clean being expended in passing through the trap.

Again, in most cases the soil-pipe is in close proximity to windows and doors, and if a disconnecting trap were inserted here, every time the closet was used the fact would be proclaimed to all near through the medium of the nose. Mr. Buchan speaks about disease germs from one untrapped (ventilated) soil-pipe passing into another and through closet trap. I should like to ask him if he has *proved* this to be possible, or is it only supposition? He also seems to ignore the fact that the air current is not always so obliging as to obey his directions, as shown by arrows on his trap diagrams, and very often the air "inlet" becomes a drain gas outlet. Thus, with a disconnecting trap at foot of soil-pipe, disease germs would escape from the open grating; they would then be really dangerous so close to house. He also writes as if the closets composed wholly of earthenware are less reliable than others; but experience proves otherwise. Mr. Buchan's simile about the water-tight divisions of a ship appears to be far from applicable.

Much of the matter in "Clerk of Works'" letter is beside the question, and contains mere assertions unsupported by argument. There is probably room for improvement in the ventilation of drains, but what he says about the air current often being downward, supports the objection to an open grating at foot of soil-pipe. If a second pipe or a valve be provided, these also present some objections, and should only be employed in the special cases previously referred to.

We must not take one or two isolated cases to prove a general principle, and in house sanitation the whole arrangements must be considered, and not some "fad" pushed forward regardless of all else. Our usual practice here for ordinary houses is to place a disconnecting trap on main drain as close to sewer as possible, with the air inlet carried up a wall if necessary; the soil-pipe we use to ventilate main drain carried to a reasonable height above eaves, and left free from any cowl. This plan is thoroughly tested hundreds of times yearly, and (together with open discharge of waste and rain pipes and trapping of w.c.'s, gullies, and wastes) is found to be perfectly satisfactory under all conditions, in preventing any drain or sewer gases entering house.—I am, &c.,

Oct. 22nd. C. E.

Sir,—I am obliged to "Clerk of Works" for his remarks on page 632, which further corroborate what I said on page 601, to the effect that it was not true, as the engineer of this Association asserted, that "It is now generally acknowledged that no traps should intervene between the trap on the main outlet and the soil-piping."

Since my last letter appeared I have been examining the drainage of Belmont Castle, which has been almost entirely rebuilt and enlarged this year by Mr. James Thomson, F.R.I.B.A., Glasgow, for the Right Hon. H. Campbell-Bannerman, M.P., and I beg to state that the drainage here is executed upon the sectional system—viz., with traps intervening between the main outlet traps and the soil-piping, each soil-pipe, waste-pipe, and rain-pipe or rain-pipes being separately trapped off from the drain, and the drain itself has a special blow-off pipe carried up above the house. Mr. Campbell-Bannerman, Mr. Thomson, and myself were talking over the merits and demerits of trapping off the soil-pipes from the drain, or of using the soil-pipes to ventilate the drain. I am authorised by Mr. Campbell-Bannerman to state that he much prefers the style in which his house is done—viz., with the soil-pipes each trapped at foot and ventilated separately, considering it the safest plan.

Mr. Thomson has been in the habit for years back of executing his best drainage work in this style such as at Tilliechewan Castle, Stracuthro House, Gartshore, &c.; while many other architects throughout the kingdom, as well as surveyors, engineers, and plumbers, work in the same way. Some of the master plumbers who have done work for the above Association have told me within the last few days that they did not approve of the way in which they were ordered to do the work. One of the best master plumbers in the east of Scotland writes me:—"I think you are quite right in your sectional system of drainage, especially with a mansion-house of any pretensions."

As to the extra expense of the 2, 4, 6, or 8 or so more traps, I find gentlemen do not consider that worth speaking about, or the special blow-off pipes either. Their minds are easier, and they consider they soon save the expense off the doctor's bills. As to taking the traps out, Mr. M. G. Neilson, Glasgow, who has had his former and present house drained on the sectional system, says:—"I shall not allow your disconnecting traps at the foot of the soil-pipes of my present house to be taken out while I reside in it."

I think Mr. Rottenburg has done good in causing public attention to be drawn to this matter. These sanitary associations, since their rise in 1878, have done a considerable amount of good in superintending the work where the masons and plumbers were ignorant; but now that plumbers generally are getting better educated there will by-and-by be less use for them. And in a dispute or otherwise between an architect and his plumber, a consulting sanitary plumber will be a better man, in my opinion, to call in to settle it than a civil engineer, who has been merely dabbling in the business, and especially if he is one of the sort that "Clerk of Works" refers to on page 632, as recommending hot-water copper pipes to be taken out and iron ones substituted as an *improvement*.

This raises the idea—How many more foolish mistakes have some of the engineers of these associations made that have yet to be found out?—I am, &c., W. P. Buchan.

Intercommunication.

QUESTIONS.

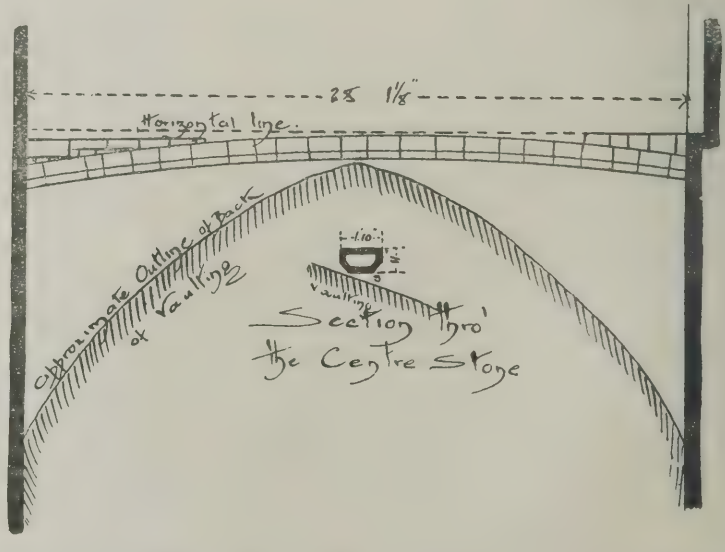
[9438.]—**Brickmaking.**—Can any practical reader help me with information or advice *re* the following? I have a piece of land in London which will yield, after levelling and excavating, about 5,000 cubic yards of good clay. Would it pay to make bricks of this? All plant would have to be obtained. The bricks would be used afterwards for buildings to be erected on the same site.—T. H. Black.

[9439.]—**Science for Engineers.**—Would some reader kindly give his opinion as to whether it would be to the ultimate advantage of a young man who has served three or four years in the office of a C.E. to take a three years' course of study at the Normal School of Science, Kensington? If so, a few hints as to subjects, &c., would oblige.—Science.

[9440.]—**Roof.**—I am about to put up a roof ½rd pitch, 18ft. span, and 32ft. long, and purpose using couples 18in. from centre to centre, the rafters to be 4in. by 2in., upper collars 3in. by 2in., bottom collars or ties, which will also act as ceiling joists, 4ft. 2in., the bottom collars to be hung up to the 7in. by 1½in. ridge by a 2in. by 2in. suspending piece, which will also be spiked to the upper collars, the couples to be notched to a 11in. by 3in. wall-plate, and to be connected with a 3in. by 2in. piece, running the whole length of the roof and spiked to the backs of the upper and lower collars, as well as by 1in. by 2in. slating battens. I may say that the collars are so arranged as to divide the rafters into three equal parts. If any reader will criticise this construction, I would feel much obliged.—Excalibur.

[9441.]—**Early English Foliage.**—Will any one tell me the natural form of the conventional foliage so universally employed in Early English Gothic?—Fagging for Exam.

[9442.]—**Mortar.**—Which is the best practical way of securing the prescribed proportions of lime and sand or ashes for making mortar in a mill, so that the clerk of works may know that he is getting the specified quantity during his absence, as he cannot constantly be watching the mill, and sometimes may be engaged to give only half his time to that building? As this is a most important matter, replies from practical readers will be esteemed.—Mortar.



[9443.]—**Perpendicular Style.**—I shall be glad of a few hints on the above, names of architects who flourished at that period, buildings in or near London that I can study, and any other information that will be useful in giving one a help in the study of this style.—City Pupil.

[9444.]—**Cavendish Memorial Tomb.**—I shall feel obliged if any one can inform me where the monumental effigy in marble of the late Lord Frederick Cavendish (assassinated in Phœnix Park), exhibited by Mr. Thomas Woolner, R.A., at the Royal Academy in 1885, was erected? It will be remembered that Mr. Woolner complained of the bad lighting of the place it occupied in the sculpture room, but the architectural journals and Academy catalogue were silent as to its proposed destination. Has it been placed in Cartmel Priory Church?—E.

REPLIES.

[9432.]—**Black Stains in Varnished Stained Deal.**—I judge you used pine, not white deal or yellow deal. Please state which.—Tekton.

[9426.]—**Arch in Lincoln Cathedral.**—This peculiar arch, or "stone beam," as it is generally called, is situated above the vaulting between the two west towers at Lincoln Cathedral. The purpose for which it was built is uncertain; but the usually received opinion is that it was intended as a test to ascertain if the towers, which were then being built, would safely bear the superincumbent weight. The strength of the arch would tend to keep the towers apart, and if they inclined outwards the fact would be at once made known by the arch stones falling in. When stamped upon, it visibly vibrates. The lower course of stones alone follows the curve of the arch. There is no appearance of the stones being tenanted together, but the end stones of the lower course are both built into the tower walls. All the voussoirs are through stones. The extrados of the arch is not hollow, for when levelled the north end is 6⅜in. lower than the south end. The dimensions are as follows:—Length, 28ft. 1¼in.; depth in middle, 11½in.; at the north end, 28¼in.; at the south end, 21in.; the width is 22in. The west side of the arch is about ¼in. above the summit of the groining; the east side, owing to a fall in the groining, is 3in. above it. The lower edge on both sides has a deep splay. The sketch is drawn to scale, and is from actual measurement.—Siamese Twins.

[9433.]—**Damp.**—I should recommend "R." to underpin and insert an air-course of vitrified bricks below the floor level. Sometimes a dry area excavated externally all round the wall has obviated the rising of damp; but this could probably only be applied to one outer wall. The only other remedy is to batten the inside of the hall. It is not probable that the damp will disappear eventually if nothing is done, as the suctional qualities of the bricks are the cause of the mischief.—G. H. G.

STATUES, MEMORIALS, &c.

DUNDALK.—There has recently been placed in a niche in the Convent of Our Lady of Mercy, Dundalk, a life-size statue of St. Joseph, supporting the infant Jesus on his left arm, whilst the right hand holds a spray of lilies. The faces and hands are highly finished, and the drapery is bold and original. The material used is Portland stone. Mr. C. L. Harrison, of 178, Great Brunswick-street, Dublin, is the sculptor.

STAINED GLASS.

DOLFOR.—Two two-light stained-glass windows have recently been erected in Dolfor Church, Newtown, Montgomeryshire. One was in commemoration of Her Majesty's Jubilee, and illustrated the figures of King David and Esther, a medallion of Her Majesty the Queen appearing in the top part of the tracery; the other represents the figures of St. John and St. Paul. The execution of the work was intrusted to Jones and Willis, of Birmingham and London.

WATER SUPPLY AND SANITARY MATTERS.

DALMENY, QUEENSFERRY, AND KIRKLISTON DISTRICT WATER SUPPLY.—The water supply of the eastern district of Linlithgowshire being insufficient for the wants of the inhabitants, owing to the increase of population due to the construction of the Forth Bridge, the local authorities of Dalmeny, Queensferry, and Kirkliston have combined for the purpose of bringing in a new water supply to the district. A sufficient supply has been found in springs at Morton-hall, two miles from Mid-Calder. The pipes will be laid along the public road to Queensferry, a distance of over thirteen miles. The total cost is estimated at between £8,000 and £9,000. The work will be begun very shortly. The engineers are Messrs. Leslie and Reid, Edinburgh.

HALIFAX.—The Corporation of Halifax now supplies water to a population of 140,000 persons, and finds its reservoirs are inadequate to meet the demands made upon them during seasons of drought, although at present the supply is equal to 29¾ gallons per day. Consequent on a report from Mr. G. H. Hill, of Manchester, the Corporation have decided to promote a Bill in the next session of Parliament for receiving powers to extend the Walshaw Dean scheme, and also for the construction of a reservoir on the hill-side below Greave Clough, obtained some years since, but allowed to collapse. Should the Bill be successful, the Corporation will proceed with the construction of three new reservoirs, placed together, in the Walshaw Dean. From the reservoirs the water will be conveyed by a culvert, which at present extends from Widdop. The area to be appropriated covers 2,300 acres, and after allowing for compensation, it will yield an additional supply of about 2½ million gallons a day to the town. The new reservoir at Greave Clough will be designed to catch the flow of water which cannot be turned into Widdop on account of the discolouration of the water as it passes over peaty ground, and the water will be rendered fit for domestic purposes. The construction of the new works will occupy at least four or five years. The cost is estimated at £150,000, which, with the previous expenditure, will bring the total amount of money spent on the waterworks system up to £750,000.

SEWER VENTILATION.—The Wimbledon local board received at their last meeting a report on sewer ventilation, presented by their engineer, Mr. W. Santo Crimp, in which he declares that the system of ventilating it by openings at the street level is an obnoxious one. The movement of sewer gases depends, he finds by experiment, on the temperature; thus in the summer months the gases escape at the openings at the lowest level, and during the winter the direction is reversed, and the outflow of gas is at the tops of the hills. He believed that it cannot be shown that the excessive ventilation of sewers which are too small for men to work in is necessary or of the smallest advantage. All that is required is that sufficient vent should be provided to render the admission of sewer gas into dwellings impossible, and if houses are properly drained this is accomplished even when sewers are unventilated. He suggests that the ventilation of the sewers in the district could be accomplished for £500 by attaching outlet pipes to lamp-posts, houses, and even trees.

Among the receiving orders in bankruptcy announced in Friday's *Gazette* was one relating to Goodman Brown (trading as Brown and Son), Kingsland-green, High street, Kingsland, "builder, surveyor, and contractor."

A district church is about to be built in the suburb of Highcliffe, Chilcombe, near Winchester, from plans by Mr. T. Stopher, of the latter city.

Our Office Table.

THE opening meeting of the Society of Architects for their fourth session will be held on Tuesday fortnight, Nov. 15, in the Society's new meeting room, St. James's Hall, Piccadilly, when an inaugural address will be given by the president, Mr. Joseph J. Lish, of Newcastle-on-Tyne. The principal room is on the first floor, overlooking Piccadilly, and is about 40ft. square, seating some three hundred persons. The suite of apartments, including secretary's office and council room, are being decorated and furnished, under the direction of a committee, Mr. C. Stanley Peach, the hon. corresponding secretary, acting as architect. The chandelier and side brackets throughout are of wrought ironwork, some Spanish 16th-century work supplying the *motif* for the masks and scrolls; they have been executed from Mr. Peach's designs by Messrs. Starkie, Gardner, and Co., 29, Albert Embankment. The floors are laid with felt, executed by Mr. O'Neill, of Watling-street; and in the large room a carved oak chair is provided for the president, the other seats being of Austrian bent wood. The painting and decorations are being carried out by Mr. T. Yeomans, of High Holborn. The members are to be congratulated on the convenience and accessibility of the new premises, in which not the least improvement in the arrangements is that the secretary's office and meeting room are brought together under the same roof.

THE late Mr. Beresford-Hope, whose death was announced at the age of 67 at the close of last week, will be chiefly remembered by architects as one of the earlier lay advocates of the Gothic Revival, of which he was a zealous partisan and supporter alike by voice, pen, and purse. He was one of the earliest members and president of the Cambridge Camden (afterwards the Ecclesiological) Society, and so far back as 1844 purchased and restored the ancient buildings of St. Augustine's Abbey as a college for missionary clergy, and nine years since helped to found St. Paul's Ecclesiological Society, of which he was at the time of his death a vice-president. Professor Kerr told the members of the Architectural Association on Friday evening how, in 1847, when President of that body, then newly established, he invited Professor Cockerell and Mr. Hope to visit Lyon's Inn Hall, to hear his address. At the close, Professor Cockerell spoke in favour of Classical styles, and was followed by Mr. Hope, who characteristically took an opposite view. Mr. Cockerell listened with Olympian indignation to the audacious championship of Gothic by the young M.P. for Maidstone, and when he sat down remarked: "I knew Mr. Hope's father, and he never held such views as these." Mr. Beresford-Hope joined the Institute of British Architects in June, 1850, as an honorary Fellow, and from 1865 to 1867 was President, being the last non-professional and dilettante occupant of the chair. On his retirement from office his portrait, a kit-cat, was painted, by subscription, by the late C. Martin, R.A., and now hangs in the Institute meeting-room. It may be noted that of the sixteen gentlemen connected with architecture whose portraits decorate the walls of the room, all are deceased with the exception of Mr. Charles Barry. Mr. Beresford-Hope's funeral took place at Christ Church, Kilndown, on Wednesday, and was attended by very many friends, including Messrs. Edward I'Anson, P.R.I.B.A., Arthur Cates, and James Brooks as representatives of the Institute, and by Mr. H. Roumieu Gough representing the St. Paul's Ecclesiological Society and the Society of Architects, in which Mr. Hope took a great interest.

THE annual report of the Committee of the Auctioneers' Benevolent Fund, for the year ending June 30, 1887, which will be presented at the annual meeting to be held to-day (Friday), states that the subscriptions amounted to £222 12s., and the donations to £93 9s., the subscriptions amounting to exactly the same sum as that received during the preceding year, and the donations slightly exceeding the amount in the last report. The number of the newspaper proprietors, either as donors or annual subscribers, has somewhat increased, and a donation of fifty guineas has also been presented (through the honorary secretary, Mr. E. Walter Rushworth) by the Select Society of Auctioneers (founded 1800) in commemoration of the Jubilee of Her Majesty's reign. The Society has now seven annuitants, whose annuities amount in the aggregate to £134 per annum, and the annual sum paid under this head has been increased since last year by £24. The account of the treasurer, Mr. Daniel Watney, shows that during the year the sum of £250 has been invested in Consols in the names of the trustees, the investments now being—Consols, £870 11s. 3d. stock; Queensland 4 per cent. Inscribed, £2,979 8s. 6d. stock. The members of the Committee retiring are:—Messrs. Lewis, Newbon, Oakley, Perkins, Roberts, Thurgood, and Walker, all of whom are eligible for re-election.

MR. GEORGE WILLIAM REID, F.S.A., late Keeper of the Department of Prints and Drawings at the British Museum, died on the 20th inst., aged 68 years. He received the above appointment in 1860, having previously held a post in the same department at the British Museum for 18 years. In 1883 Mr. Reid retired from the Keepership of Prints and Drawings on a pension, and was succeeded by Professor Sidney Colvin. For two years before his death deceased had been engaged in cataloguing the valuable collection of works in the possession of the Duke of Devonshire. In addition to being the compiler of several catalogues dealing with various art collections in the British Museum, Mr. Reid was the author of the descriptive letterpress to many illustrated works on art subjects. Mr. Reid was himself an art connoisseur and patron, and leaves behind him a choice collection of rare engravings, examples of the old English water-colourists, &c.

CHIPS.

The county magistrates of Hertfordshire have raised the salary of Mr. Urban Smith, of Hertford, county surveyor, and surveyor of county highways, from £400 to £500 a year.

The new hospital at Rock-place, Hastings, was opened on the 13th inst. It is built of red brick, with stone dressings, and has in either wing two circular wards, with open-air balconies on top, and central ventilating and chimney shafts. The buildings are four stories in height, and contain 72 beds, besides five cots for children. The total cost has been £19,500. Messrs. Young and Hall were the architects.

A special meeting of the Preston town council was held on Friday for the purpose of considering the expediency of promoting in Parliament a Bill for the purpose of securing powers to borrow £510,000 for the completion of the Ribble Works, for having the borough extended, and for giving a site for technical schools. After discussion the motion was carried.

An altar-cross, designed by Mr. J. L. Pearson, R.A., for erection in Truro Cathedral, which will be consecrated next week, has just been executed in the workshop of Messrs. Cox, Sons, Buckley, and Co. (of London and New York), in Esher-street, Westminster. It is of silver, richly gilt and jewelled, its height being 2ft. 8in. In outline and general effect it is similar to many crosses of the 14th and 15th centuries. The "Agnus Dei" is shown in the centre, whilst at the extremities of the arms, as well as at the top and base of the shaft, are angels censing. At the base of the cross is an octagonal boss, round which, under cusped canopies, are statuettes of adoring angels in high relief. The foot of the cross is a cusped octagon; a lower knop on the fluted shaft of the base is set with square-cut amethysts and garnets. The arms and shaft of the cross are set with amethysts, garnets, topazes, and "aqua-marines" in cabochons. Messrs. Cox, Sons, Buckley, and Co., have also executed, under Mr. Pearson's supervision for the same cathedral, a festal frontal of creamy white silk damask and of golden toned "plush" velvet, richly embroidered. It is divided into three panels by four orphreys of golden satin, on which are embroidered cherubim, surrounded by borders of wheat and grapes. The ground of the three panels consists of silk damask, woven with a Moresco-Sicilian design of foliage and birds of Early 14th-century character. On this ground are embroidered in high relief the symbolical flowers of the Blessed Virgin, such as the lily, marigold, and the "mystical" rose. The superfrontal of auburn golden velvet is embroidered with a continuous pattern of roses and flowers-de-luce; whilst the centres of many of the flowers are set with bosses of real amber, which serve to accentuate and give harmony to the whole effect. The frontal is 10ft. long and 3ft. 6in. high.

LEGAL INTELLIGENCE.

A Surveyor Convicted. — John Leslie Weston, a surveyor, was indicted at the Central Criminal Court on a charge of obtaining from Mr. A. P. Payne £153 2s. by false pretences. The prosecutor is a solicitor, practising in Essex-street, Strand. The defendant asked him to advance the sum of £153, which the defendant said he had to pay on certain work on an estate of ten acres near Tilbury, for which the defendant said he had paid £4,300. It was subsequently found that so far from there being, as defendant said, no further encumbrance on the estate, the defendant had obtained other sums of £600 and £361 10s. The prosecutor found the property was not worth more than £500, as it consisted chiefly of a gravel-pit. It was contended, in defence, that the defendant acted throughout in perfect good faith. The jury found the defendant guilty, and sentence was postponed.

In re Blunderfield and Aide.—The bankrupts, builders carrying on business at Fulham and Hammersmith, applied to the Court of Bankruptcy on Wednesday for an order of discharge. The unsecured debts were £2,413, with a surplus in assets. The debtors commenced business in 1880, with a joint capital of £1,000. The Official Receiver having reported that the bankrupts had not kept proper books of account, Mr. Registrar Giffard suspended the order of discharge for six months.

MEETINGS FOR THE ENSUING WEEK.

Saturday (to-morrow).—Association of Municipal Engineers. Meeting at Luton 12.45 p.m. Paper by W. H. Leete, borough surveyor, on "Luton Sewerage, Past and Present."

Tuesday.—Manchester Architectural Association. Address by the President, A. H. Collies-Davey.

Thursday.—Builders' Benevolent Institution. Annual Dinner, Carpenters' Hall, London Wall, 5.30 for 6 p.m.

Royal Archæological Institute. Papers on "Work of the Egypt Exploration Fund in the Spring of 1887," by F. Ll. Griffiths; and "Antiquities in Brittany, lately Visited by the Royal Archæological Institute," by Herbert Jones. Oxford-mansions, Oxford-street, W.

Friday.—London Architectural Association. "Architectural Modelling," by J. C. L. Sparkes. 7.30 p.m.

Geologists' Association. "Fifty Years Progress in British Geology," by F. W. Rudler, President University College. 8 p.m.

Birmingham Architectural Association. Conversazione at the Assembly-rooms, Edgbaston.

Saturday.—Association of Public Sanitary Inspectors. Address by the Chairman of Council, Hugh Alexander, of Shoreditch. Westminster Town Hall. 6 p.m.

CHIPS.

The Edinburgh Improvement Trust have accepted an estimate for the erection of a memorial tablet to Sir Walter Scott, to be placed in a tenement now in course of construction at the corner of Chambers-street and Guthrie-street, on ground the property of the Improvement Trust. The tablet will bear the inscription: "Near this spot stood the house in which Sir Walter Scott was born; August 15, 1771. Erected by the Magistrates and Town Council; Sir Thomas Clark, Lord Provost. James Lessels, architect."

A Jubilee Fountain has just been completed at Stafford. It is Early English in character, and follows the general style of the Eleanor crosses, in having four gables surmounted by a spire, all crocketed. It is approached by four steps of York stone, and the base is of polished grey granite. The shafts are of red granite and green serpentine, and are surmounted by an order of moulding in the arch, with dog-tooth ornaments. The gables and the spire are of Hollington stone. The basins are of red granite, with grey granite supports. The lions' heads from which the water issues are of bronze, cast by the Coalbrookdale Company, Shropshire. A recessed panel on either side, with a trefoiled head, bears an inscription. There are also recessed troughs for dogs on each face of the base. The whole has been designed by Mr. George Wormal, and the work has been carried out by the contractor, Mr. G. J. Benton. The carving has been executed by Mr. J. Hollister, of Bath-street, Birmingham.

Mr. W. T. Blackmore was elected secretary of the Institute of Painters in Oil Colours on Wednesday night.

A structure is being erected on Manchester Racecourse for Buffalo Bill's show, which will open in December. Messrs. Mangnall and Littlewoods, architects, of Manchester, have designed the building, the erection of which has been intrusted to Messrs. R. Neill and Sons.

St. Lawrence's Church, Pudsey, was reopened on Wednesday week by the Bishop of Ripon, after being restored and internally painted and decorated. A stone chancel screen has been erected, and oak choir stalls have been fixed, also oak-panelled moulded screens to the vestry and side of organ, and the chancel floor has been raised and laid with mosaic pavement. The whole of the work has been executed from the designs, and under the superintendence of Mr. Thomas Winn, architect, of 5, Park-lane, Leeds, by the following contractors: —Painting and decorating, Mr. J. T. Pollard, Leeds; stone screen wall, Messrs. Thompson and Sons, Leeds; marble steps to chancel, Mr. A. Welsh, Leeds; choir stalls and oak screens, Mr. Thomas Haton, Pudsey; mosaic pavement, Messrs. De Crelle, London; wrought-iron stall railings, Mr. A. Jones, Manchester.

Tobacconists' Trade.—How to Open Remuneratively from any amount, however small. Write at once for Illustrated Catalogue, post free.—LESSER FRIEDLANDER, Tobacconists' Complete Furnisher, 3, Houndsditch, London. Oldest, best, and cheapest house in the world. Established 60 years.

Depression of Trade.—Complaints about the falling off in consumption of many articles are loud and universal, but there is one exception to the prevailing dulness, viz.: GRANT'S MORELLA CHERRY BRANDY, for this popular liqueur not only maintains its position, but continues to increase in favour notwithstanding the efforts to supplant it by rubbishy imitations. Observe our branded corks and capsules. Sold by Wine Merchants, and by THOMAS GRANT and SONS, Maidstone, and 46, Gresham-street, E.C. Makers of the delicious Morella Marmalade. Sold by Grocers.

Holloway's Pills.—These Pills never prove delusive or give merely temporary relief, but attack all ailments of the stomach, lungs, heart, head, and bowels in the only safe and legitimate way, by depurating the blood, and so eradicating those impurities which are the source and constituent of almost every disease.

DOULTING FREESTONE.

THE CHELYNCH STONE.—This Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

HAM HILL STONE.

Greater facilities have been provided for working these Quarries and the Stone can be supplied in large quantities at short notice. Prices and every information given on application to

CHARLES TRASK and SONS,
NORTON-SUB-HAMDON, near ILMINSTER, SOMERSET.
London Agent:—
E. A. WILLIAMS, 16, Craven-street, Strand.

HYATT'S LENS and "SEMI-PRISM" LIGHTS for PAVEMENTS, STALLBOARDS, ROOFS, &c. TILE and GLASS LIGHTS in beautiful designs.—THADDEUS HYATT, Manufacturer, 9, Farringdon-road, London, E.C.

120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

Ashford, Kent.—For new shop-front and repairs to 9, New Rents, for Mr. C. U. Savage. Mr. H. J. Jeffery, M.S.A., of Ashford, architect and surveyor. Quantities by the architect:—

Knock, H.	£390 0 0
Howland Bros.	329 0 0
Tournay and Son	308 5 0
Giles, Burden, and Giles (accepted)	300 0 0

All of Ashford.

Barnes, Surrey.—For erecting a mission-hall in Railway-street. Mr. W. H. A. Berry, A.R.I.B.A., 35, Bedford-row, W.C., architect. Quantities by Mr. J. Kennedy, 31, Great James-street, Bedford-row, W.C.:—

Adamson and Son, Putney	£900 0 0
Hill, J., Barnes	890 0 0
Sale, A.	786 0 0
Hunt, A.	733 0 0

Birmingham.—For the erection of thirty-six houses and cottages, for Mr. E. Riley, in the Chain-walk, Lozells Birmingham. Mr. T. G. Price, architect. Quantities by the architect:—

Williams, Aston	£5,330 0 0
Hughes, Handsworth	4,930 0 0
Hulbert, Handsworth	4,886 0 0
Bloore, Aston	4,881 0 0
Archer, Birmingham	4,850 0 0
Barker, Handsworth	4,831 0 0
Bamfield, Aston	4,775 0 0
Twigg, Birmingham	4,700 0 0
Pritchard, Handsworth	3,900 0 0
Johnson, Nechells	3,580 0 0
Hopkins, Aston (accepted)	3,470 0 0

Birmingham.—For the erection of two semi-detached houses in the Hampton-road, Birchfields. Mr. T. G. Price, Birmingham, architect:—

Hopkins, J., Birmingham (accepted)	£740 0 0

Builth.—For building a new farmhouse at Cwmwynthe near Builth, and alterations and additions to the Bank House, Builth. Mr. S. H. C. Coles, Rhayader, Radnorshire, architect:—

	A.	B.
Dore, G., Rhayader—	—	£430 0 0
Meredith, A., Newbridge-on-Wye—	£69 0 0	430 0 0
Jones, J. M., Builth (accepted)—	33 0 0	380 0 0
Price, H., Builth—	66 10 0	306 0 0

A.—Alterations, &c., to Bank House. B.—Cwmwynthe Farm.

Burnley, Lancs.—For new Congregational Sunday-school, Hollin Greave-road. Mr. C. Parsons, 9, Grimshawe-street, Burnley, architect. Quantities by the architect:—

Mason's work:—	
Smith and Bell	£1,608 13 3
Heap and Harrison	1,585 0 0
Hargreaves L. and J.	1,475 1 4
Parker, J. and A.	1,455 0 0
Nightingale, L.	1,326 0 0
Smith and Kippax*	1,275 0 0
Carpenter and joiner's work:—	
Smith, G., and Sons	525 5 0
Dean, R., and Sons*	490 0 0
Brown, R.	435 0 0
Plumber and glazier's work:—	
Smith, J.	143 18 6
Shoesmith, J.	121 10 0
Lang, J.	96 0 9
Owen and Co.*	92 0 0
Plasterer and painter's work:—	
Aspinall, W.	94 0 0
Watson, H.	83 19 6
Radcliffe, T.	83 0 0
Preston and Sons	79 0 0
Slater's work:—	
Stanworth, W.	120 0 0
Whittaker and Schofield	115 0 0
Pickles Bros., Leeds*	90 19 0

Rest of Burnley.
* Accepted.

Canterbury.—For iron roof, Greengrocery Market Canterbury. Mr. F. Baker, C.E., surveyor:—

Hodson	£426 10 0
Wiltshire (accepted)	395 0 0
Jukes and Co.	386 0 0
Roof only:—	
Rendle and Co.	359 10 0
Newton and Co.	356 0 0
Willey and Co.	345 0 0
Pocock	328 0 0
Goddard and Massay	320 0 0

Colne, Lancs.—For new Liberal club, lock-up, shops &c., New Market-street. Mr. C. Parsons, 9, Grimshawe street, Burnley, architect. Quantities by the architect:—

General tender:—	
Craven, T., Blackburn	£2,098 0 0
Mason:—	
Naylor, Padiham	1,320 0 0
Hargreaves, L. and J., Burnley	1,199 12 9½
Lancaster, P., Colne	1,100 0 0
Hawley, J., Colne *	1,040 0 0
Carpenter and joiner:—	
Riddiough and Co., Colne	670 0 0
Greenhow and Sugden, Keighley	560 0 0
Watson, I., Colne	556 0 0
Tomlinson, R., Keighley*	498 10 0
Plumber and glazier:—	
Carter, J. H., Keighley	174 13 4
Newbould, B., Keighley	172 10 0
Varley and Sons, Colne*	163 12 10
Binns, R., Colne	155 0 0
Shoesmith, J., Burnley	150 0 0
Plasterer and painter:—	
Hartley, J., Colne	71 0 0
(Nine tenders received.)	
Slater:—	
Whittaker and Schofield, Burnley	48 17 0
Stanworth, W., Burnley*	40 0 0

* Accepted.

Ealing.—For the erection of a house in the Hamilton-road, Ealing, for Mr. J. Lee Thomas. Mr. R. Willey, F.R.I.B.A., 66, Ludgate-hill, E.C., architect:—

Wye, T., Ealing (accepted)	£1,720 0 0

Eastbourne.—For the erection of rocket-apparatus house, for the Eastbourne corporation:—

Coster J., (accepted)	£104 0 0

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LIII.—No. 1713.
FRIDAY, NOVEMBER 4, 1887.

ARCHITECTURAL PRACTICE.

THE modern practice of the architect covers a wider and larger field than it did formerly. Take the career of a successful provincial architect. In many instances we find him to have had an aristocratic connection in the county, to have been employed by the leading landed gentry in the improvement of their seats or estates, and to have been the architect, at least, of nearly all the important residences and churches of the district. This class of practice naturally led to a general surveying practice, in connection with improvements of properties, drainage, and other matters. It was a convenient and comfortable kind of connection, with little to distract the mind, as there was always something doing. The class of practice to which this description refers has, to a large extent, ceased to exist. Forty years ago there were many of our leading architects who amassed respectable fortunes in it; but through the vicissitudes and misfortunes which have befallen many of the hereditary nobility, the extravagance of their descendants, many of the faults inherent in the old system of primogeniture, to say nothing of the fall in the value of land, and other social causes, the modern architect has very little to depend on from this source. The number of new mansions and large country residences is yearly falling off, and houses of a different class are required; the age of palatial residences has departed. A new class of building has taken their place. In the provincial centres the architect's business nowadays is mainly confined to residences for successful merchants and manufacturers, and to the construction of commercial and business premises; the higher class of practice is left only to a few. But his requirements are proportionately greater. A greater variety of tastes and businesses have to be consulted in the preparation of designs. In the Metropolis still more is this the case. The architect is now engaged for a number of purposes which formerly were not considered worthy of his attention or taste. Warehouses, breweries, and even such utilitarian structures as factories are seldom built without an architect, not to mention the varied new establishments that have sprung into existence.

In a single article it would be impossible to enter into all, or even a few, of the directions in which the architect is required to give his services; but there are three great divisions of an architect's practice which now call for his chief consideration. These relate to what may be shortly defined as Business, Construction, and Architecture. We place business first, because without it architectural practice cannot be said to exist; for pure architecture is simply an art, and may be taken up as any other study of art or branch of literature. We cannot divest the modern architect of business, for he undertakes not merely the design, but the carrying out of work with which he is intrusted. First as a business agent, then, we must look at him. Surveying so called, and the origin of the term is a little dubious, forms one of the main qualifications. The title of "surveyor" was doubtless originally applied to a superintendent or overseer, in which sense it was certainly used in all early documents. Thus, so early as the 11th century the term was applied to those engaged in superintending buildings and repairs. "Surveyor of the King's Works and Palaces" is a frequent entry in old accounts. We read of surveyors of land; of Inigo Jones having been appointed surveyor of works (1610) to King James I., of Sir C. Wren being appointed the surveyor-general of St. Paul's. The early signification of the term was that of overseer or superintendent; but at a later date the term is applied to measurers of land, and even to architects. Whatever the exact meaning conveyed by the title, the surveyor is supposed to be a man of practice—a business man. It means a great deal more now than formerly. Land surveying is only one branch of the business. Taking the sub-divisions of the profession as now given for the examinations held by the Surveyors' Institution, they are three: Land Agency, Valuation, and Building, in either of which special branches a candidate may qualify. Now, the architect ought in each of these sub-divisions to know enough for his practical requirements. In the improvement of farm buildings and landed estates, not only is land surveying required, but matters relating to drainage and agriculture are essential qualifications. As a valuer of property, the architect should doubtless know as much about building valuations as the expert valuer, if he wishes to become a successful practitioner in a provincial town. Then the laws of landlord and tenant, of fixtures, dilapidations, and easements, are of the utmost importance to anyone engaged in building operations. We know of architects who are almost ignorant of them—but this is a defect of their general education, and cannot remain much longer; for if an architect is never called to negotiate about questions of this kind, he should at least understand the rights and obligations of his clients and those around him. He cannot design with safety any house or business premises in town or country unless he knows something of law. In large towns—in London, for example—the architect must be an adept at meeting all kinds of official law and regulations to make things go smoothly. The client expects him to know the "ins" and "outs" of municipal and sanitary law, and to steer clear of those difficulties and expenses into which the unwary are so liable to be landed. Such, then, is the surveyor-ideal of practice. Negotiation on matters of business is one of the chief duties of the architect. It is as a negotiator that an architect succeeds in his profession, and we have never met with a successful practitioner who has not been a skilful negotiator. If we were asked what makes a good business man, we should say the art of negotiating. The surveyor is a man of figures, a good arithmetician, and it is this habit of mind that begets precision both in statement and in business habits. We have here one of the strongest grounds for advocating quantity-taking as a training for the young architect. Why art is so incompatible with the surveyor's qualifications is not a question to be discussed here; it belongs rather to the domain of psychology. All that we contend is that the artistic function is not injured by such training, but rather improved.

(2) In construction the modern architect is called upon to show his skill in ways far more varied than formerly. The mechanical principles of masonry and carpentry at one time comprised all his knowledge of construction. The word now means a great deal more. It extends to ironwork and various kinds of engineering construction. The engineering work of the architect alone necessitates now a course of instruction. Iron girders, simple and trussed, and iron roofing involve a special knowledge of construction that takes some time to master. We cannot in this space point to the innumerable matters which an architect is called upon to consider and arrange. But one of the most usual forms which it takes is the design and specification for any special class of iron construction—say the roofing and galleries of a hall or a theatre. The architect must be brought into communication with the engineer or manufacturer. It will not do to unburden his mind, and tell the manufacturer that he is perfectly ignorant of how to design; so he explains his wishes and ideas, and asks the manufacturer whether he will supply the needful drawings and specifications. The transaction is easy; the engineer takes all necessary particulars, and prepares a design for the ironwork, which no one questions is the architect's own. Contractors for ironwork are numerous, and competition is now so keen that many firms in the North and West will undertake to relieve the architect of all responsibility and trouble in the matter, and carry out the work for a certain sum agreed upon. The architect gives him *carte-blanche*, and is even prepared to alter his design to make it fit the work.

Though a convenient course, it is not the one which we recommend the architect to adopt. If ignorant of iron construction and details, he had better consult a competent engineer, in the first place, before preparing his working drawings, and afterwards adhere closely to his ideas, simply obtaining a tender for the work in the ordinary way. This is the proper, independent, and only business-like course. The contractor cannot take an unfair advantage of his position, although he might do in the former case, as designer and contractor in one. It leaves the architect free to adopt his own design, subject to the modification suggested by the expert in dealing with the loads or stresses, and architectural engineering has a better chance of being developed when the architect's suggestions are carried into effect. Sir Gilbert Scott's great station roof at the Midland Terminus is an example of this course of proceeding; the architect's general design was carried into successful completion by the engineers who aided him in that work. That the utmost importance exists, however, for the architect to be instructed in the mode of calculating stresses and determining the required sectional areas cannot be questioned. Without such knowledge he is largely at the mercy of the engineer, whose routine patterns are likely to be foisted upon him. In the construction of wrought-iron cantilevers for galleries in theatres, the architect is called upon to show his ingenuity and science. Unfortunately, the architect is too prone to hand over this kind of work to the contractor or expert without reservations, and it is here that those unhappy compromises are made which lead to the disfigurement of our edifices and the reproach of English architecture.

(3) In architecture proper little need be said; the architect is supposed to be master of the situation. Churches and houses have from early ages been the inalienable possession of the architect. As in construction, here also he should be able to assert his opinion in questions of arrangement and artistic design. But in these days of amateurs, ecclesiological societies, and Church Congresses it is very hard for an architect to insist upon his views being carried out with integrity. Even so eminent and skilled an ecclesiastical architect as the late Sir Gilbert Scott found the troublesome and opinionated amateur at his elbows. We know of one architect whose design for a country church was despoiled by the omission of the chancel, so obstinately did the incumbent refuse the traditional setting apart of the sanctuary from the people, though on the death of the incumbent a deep chancel was added to the church, and its design restored to its original intention. It is of little use for the designer of a church to discuss with the rector any question of proper ritual arrangement; if he does, he will probably not be the gainer; but it is necessary that he should be able to fortify his plans by an appeal to examples. The architect's learning on these questions should at least be equal to that of

his employers; he should be aware, too, of those differences in theology and modes of worship which express themselves in the architecture and plan. Nor ought it to be forgotten that the architect is indebted largely to the amateur and outsider; for it is remarkable that many of the greatest improvements and modifications in architecture have been thought of and suggested by the outsider, and have been subsequently appropriated by the profession or forced upon them. We have one forcible instance of this in the suggestion for a "Safety Theatre" by one of our most eminent actors, whose ideal plan, if carried out, would as much revolutionise the regulation theatre as the congregational mode of worship would transform the Anglican type of church arrangement.

NINETEENTH-CENTURY ART SOCIETY EXHIBITION.

THE autumn exhibition of pictures of this Society at the Conduit-street Galleries is full of amateur work, though a few of the old exhibitors of the gallery are to be noticed. H. Maurice Page paints broadly his Wargrave-on-Thames (2), a favoured spot for the artist. "Sunshine and Shadow" is a pleasing reminiscence of spring; the meadow and blossoms of tree, with the cottage, are somewhat stiff and mannered. George Jarvis's "Stream near Penzance" is pretty; the glade and rocky channel are painted with feeling. H. Franck, in his cottage interior with old woman seated by the fire (33), has very tenderly expressed in the face "Pleasant Recollections," and the drawing and colour are satisfactory. In landscape, "Near Shanklin," showing the chalk cliff, by G. A. Williams, and "The Dying Day," a quiet river valley, by Hamilton Marr, will be noticed for their truthful and genial qualities. M. S. Wallace has been less happy in the figure of "Dorothy," whose pretty face in large hat is the redeeming feature of a slender young lady with very diminutive hands and arms. Arthur Dodd in "A Stolen Heart," a dog running out of a butcher's shop with a heart, is a clever piece of satirical humour. "Teething" (29) is another work by the same hand. A rural cottage with a path winding round it to a hill, with a pond and ducks, in South Devon—is pretty; but the faded, low key of bluish-green spoils an otherwise good picture. A. Trevor Haddon's theory of sunlit greens is not happy, if this is an example. Will Anderson sends four subjects, all in his usual clear style, under an evening sky. "An Old Dove Cot" (52) and "Dolly's Ride" (111) are both agreeably solid and natural in tone. Charles J. De Lacy has succeeded in his sunlight effect on a murky-grey river scene, "Grimy Toilers of the Thames," though there is a little want of confidence in the handling. Charles Stuart's "Where Rocks Abound and Torrents Roar" (55), G. S. Walter's scene in Holland, and Robert Gallon's "On the Wye, near Chepstow" (70), an evening mist effect, are the best of a number of inferior landscapes. By far the best study of imaginative portraiture is J. de Steiger's picture, "The Princess Schahrazad Beginning her Story to the King Shahrizar." The attire of the beautiful princess in her long-flowing black hair, adorned by beaded necklaces and jewels, is not wanting in Oriental splendour, though the whole is in a subdued tone. The flesh shadows are, however, too brown and thick, and the handling rough and uncertain. Of other figure subjects, one is by T. K. Pelham (60), and "A Venetian Girl" (71), by W. Blackman, clever in its reflected light on the face. James Rick's "How Happy could I be with Either" is commonplace and exceedingly weak both in composition and colour. "Lady Maxse" (144), a full-length portrait in white dress, with light background, lacks relief. The best portrait is that of Fred. B. Fellows, of New York, painted by Herman Schmiechen, at the top of the room. W. Sidney Cooper's "Summer" (79) a cattle piece, in his usual soft chromo style, is better in its composition and drawing of cows, which are refreshing themselves by the side of the river. His study of "Cottages at Pangbourne" (67) is pleasing. An effective piece of impression is Edgar Wills's "Building the Haystack." Two other studies of coast scenery are sent by him, showing some vigorous handling and nice colour. Robert Morley's "Roses" is rich in tone, and carries away the palm for flower painting. A scholarly little Oriental study, "Biskra" (106), deserves attention for its figures and carving, by Philip Pavy; and Vincent P. Yglesias's deserted windmill, "Past Work," near it, is clever and sympathetic in its treatment. The colour and atmosphere in George E. Corner's "Early Autumn," a meadow scene, may be noticed in coming to the centre subject of the gallery—S. J. Barnes's "The Monarch of the Valley," an alpine peak painted with much power and technique. The snow-clad Alp rises from its valley seat of luxuriant vegetation, the colour and execution worthy of the subject. "Moonlight at Boulogne," by Vincent P. Yglesias (118); Arnold Helcke's open moor, "A Break in the Storm" (129), a cleverly manipulated street view, "Paris" (141), by W. Dauphine McLean; William Padgett's "Camp Fire" (157); "Sketches from Whitby," by Nevil O. Lupton, Hugh S. Shaw's "Disobedience," comprise nearly all the other pictures of remark, if we except the large canvas, "A Hard Chase," by Charles Jones, R.C.A.

The water-colour drawings contain a few examples of merit. We can only notice a few. Amongst the best of these is Henry Terry's "Study of a Child" (248), a little girl knitting a blue stocking—very simple and child-like study, in light dress and background. His old woman enjoying a cup of tea is equally true to nature. "Brentford," by Archibald Webb (253); "Iffley Mill," by W. Matthison; "Towing Path on the Severn," by John Sowden, (260); Fred Burgess's "Wimbledon Common" (291) are clever sketches, the latter for its admirable freshness, clear brushwork in the weeds and ferns, and unlaboured execution. "A Portrait Study: I Think it will do!"—a lady attired in black satin and jacket looking at a picture on the easel—is well drawn, the figure and expression good, and the accessories in keeping. One interesting architectural drawing, "The Doorway of the Church of Notre Dame, Caudebec" (300), by F. P. Barraud, is hung. The subject is a favourite one; the canopied portal and tabernacle work of the Flamboyant style are accurate in detail. By the same hand is a drawing of Tournai Cathedral, Belgium, a four-towered church of Rhenish character with transept and apse, a very interesting specimen. The view of "Lincoln" (369), hardly by the same hand, is, we presume, an early drawing by Mr. Barraud; the drawing is less steady and truthful. John Sowden sends two or three drawings of merit—"The Old Gloucester Hostelry" (374), an old timbered building of note, and "A Gloucester Farm" (358). S. D'Ouseley's "Coronation Chair, Westminster Abbey," and the Percy Shrine, Beverley Minster, by W. J. Boddy, are among other drawings of architectural interest. We may notice in commendation studies and sketches by Archibald Webb (245), Henry D. Shepherd (259), Richard H. Nibbs (312)—a clear, bright drawing—Howard S. Stormont (376), C. M. Dale (430), and K. Macaulay.

SOCIETY OF PAINTER-ETCHERS.

THE annual exhibition of etchings and studies in black and white at 160, New Bond-street, opens with a large collection of impressions, many of which are known to our readers. A society presided over by Mr. F. Seymour Haden, F.R.C.S., and having in its Council the most eminent painter-etchers cannot fail to represent the highest talent. The series of etchings by W. Sickert (2) are brilliant impressions of the Whistlerian kind, and full of expressive light and shadow. Alexis Forel, a well-known Parisian artist, contributes some charming works. His "Dans les Champs," already published, is full of sunlight and atmospheric effect; but there are other studies representing French views, picturesque, and not without that poetry of art which the etcher has it within his power to express. An effective view of "Dordrecht," by C. S. van Gravesande (14), has a great depth of tone. The thirteen illustrations to Bunyan's "Pilgrim's Progress" (19) are replete with life and character. Architectural subjects are frequent. "Durham," by Mrs. Harry Hine, is somewhat spoilt by the heavy shading and reflection of the foliage; the most pleasing examples of architecture being the etchings of Mr. Charles O. Murray. "The Fountain, Great Court, Trinity, Cambridge," is well known by the published prints by Dowdeswell. The "'Prentice Pillar, Roslyn Chapel," published by the Fine Art Society (73), is a very beautiful work of the needle, truthful in drawing and detail. The large view of "Durham Cathedral," now being published by Messrs. Dowdeswell (87), and the charming view of the west front of "Canterbury from Gateway," also published, and the "Chapel, Charterhouse," are among the impressions exhibited. For its depth and colour, "The Return from the Fair" (48), by Axel H. Haig, will be noticed. Charles J. Watson's "Whitefriars Bridge, Norwich"; Edward Slocombe's "Winter" (54), and Fred. Slocombe's "Avon at Warwick," especially the last, are admirable renderings. We prefer F. Slocombe's striking contrasts and drawing of leafless elms. David Law is represented by several landscapes; the architectural detail of the "Tower of Hereford" (65) is not very strong, but as pictures his views of "Chepstow Castle (59), of "Edinburgh" (81), "Warwick Castle," and "Windsor Castle" form an interesting series. A very charming little sketch, "A Sunny Day, Bisham-on-Thames" (78), by Wilfrid Ball, is full of poetic feeling and effect, and of exquisite finish. The effects of light and shadow are very telling in W. Sickert's series (88), and the Belgian series, by Richard Toovey (113-117), are admirable for softness and atmospheric effects.

Herbert Marshall's St. Giles's, Cripplegate, is a bold and vigorous impressson. "Trafalgar Square" (95), by Joseph Pennell; "Shot Towers," by Percy Thomas (101); and his "Thames Below Bridge," and R. Toovey's "Wapping" are charmingly delicate and brilliant productions. Ernest George, whose picturesque series of Continental streets is to be seen elsewhere in Bond-street, has here a very vigorous and sketchy subject, "Gondola Sheds, Venice" (138), and "The Rialto Steps" (157). John Finnie has also three very fine works (mezzotints) full of atmosphere, and resembling in their effects delicately-finished monochromes. The colour of the ink used and the paper have much to do with the effect and brilliancy of an etching, the warm toned tints produced by burnt sienna are generally more pleasing. Hugh Paton and William Strang also contribute some very striking etchings, and several mezzotints and aquatints are exhibited.

TRURO CATHEDRAL.

THE new cathedral at Truro, the first built in England since Wren erected that of St. Paul's, was consecrated yesterday (Thursday) in the presence of the Prince of Wales, the Archbishop of Canterbury, and many bishops. The cathedral is being built from the designs of Mr. John L. Pearson, R.A., which were

selected in a limited competition in August, 1878. The complete design was illustrated, together with a ground plan, in the BUILDING NEWS for May 14, 1880. The section now built, and consecrated yesterday, is the eastern portion, including the choir with its four aisles, the eastern transepts, the great transepts with their aisles, the baptistery, the lower part of the two eastern bays of nave, and the central tower, which just shows above the roofs at the crossing, where it is capped by a temporary conical roof. When complete the plan of the cathedral will comprise a nave and aisles of nine bays, with two western towers and spires, a large western porch, and a south porch; the great transept with its aisles, and a baptistery in the angle between the south transept aisle and the nave aisle; a large tower and spire over the crossing; the choir with an eastern transept opposite the altar, and one bay behind the altar forming a retrochoir; one choir aisle on the north side, and three on the south side of which the outermost is part of the old parish church; a small tower and spire, 135ft. high, at west end of this aisle abutting upon main south transept; and the vestries, which are obtained in a crypt below the choir. It is also proposed to form a cloister court to the north of the nave, and to erect an octagonal chapter-house on the east side of this court. The total length will be 300ft., with a width of about 76ft., the centre span between arcades in both choir and nave being 29ft. The height of the central spire when completed will be 220ft., and that of the western tower over 200ft., and height from pavement to centre of choir vaulting 70ft. In internal area Truro will, when finished, rank about twenty-second in size of English churches, being slightly smaller than Chichester, which contains, according to the useful table in Lord Grimthorpe's "Book on Building," 28,000sq.ft., or Lichfield, the area of which is 27,720ft. It will be, however, larger than Hereford (26,856sq.ft.), and of exactly the same internal height, or Ripon, Tewkesbury, Rochester, St. Nicholas, Yarmouth, or St. Michael's, Coventry.

The Late Perpendicular south aisle of St. Mary's parish church, which formerly occupied the site of the Cathedral, has been incorporated in the new building, and affords a marked contrast with the 13th-century work by Mr. Pearson, and moreover forms a valuable historical link with the past. Externally, this aisle is completely covered with ornament, built of a variety of granite which weathers badly. Internally, the work is very plain. The spaces below and between the windows are simply plastered; on the opposite side is a plain granite arcade, and the covering is a barrel-vaulted oak roof. Between this old aisle and the central portion of the choir is a second south aisle only 6ft. in width, with a wider one beyond, and to the north of the choir is a fourth aisle. The retention of the old work not only preserved unaltered some peculiarities of planning, but also exercised a great influence upon the design of the whole church. The spacing of piers for the old aisle has determined the width of the bays of the choir, as the piers of the new building all across the choir line with these old piers, and the old bays being all of different widths, no two bays of the new are exactly alike. With one exception, however, these variations are not noticeable, but in this one case the bay is so much wider than the others that in the clerestory of the choir a narrow arch has been inserted on each side between the window and the adjoining buttresses. The old aisle will have an altar placed in it, and will become the parish church. At the east end of the narrow south aisle is placed a flight of steps, which descends to the vestries placed in the crypt under the choir, and this narrow aisle will also be utilised as an ambulatory path for processions of clergy and choir. The narrow aisle rises three steps above the ambulatory, and the choir itself is again five steps above this. The steady ascent from the outer south wall to the centre of the church has a grand effect.

When the building was begun a desire was expressed to use, as far as possible, local stone in its erection. It may be remembered that a correspondence was carried on in our columns on the comparative value of granite elvans and Bath stone. Specimens were procured from a number of Cornish quarries, but it was decided that Cornwall did not produce a freestone worthy of use in such a building. The stones finally selected for external use were a greyish-brown granite from Penryn for the ashlar face and Bath stone for the dressings. Internally, the ashlaring is of St. Stephen's granite; the freestone originally selected was Doulting, but the supply of this stone being uneven in quality, Bath stone was substituted for it for the whole of the dressings inside and without, including the massive columns; nearly all this material has been supplied by Messrs. Randell, Saunders, and Co., Limited, from their quarries near Corsham. For thin shafts among the clustered columns a slaty blue stone from Polyphant has been largely used. Another stone of a brownish-grey hue from Duporth has been less freely introduced, and in other cases the shafts have been formed of the brown Ham-hill stone or the yellow stone of Northampton, and in one place of porphyry. The vaulting throughout the completed portion of the cathedral is simply quadripartite, without a ridge rib or bosses of any kind, but the ribs are decorated with dog-tooth mouldings. The windows to aisles and clerestories are long, grouped lancets, with rich mouldings. The great transepts have large rose or wheel windows above three detached lancets, and they are differently treated; a similar diversity in design is seen in the fenestration of the eastern or lesser transepts, although each of these consists of a rose above four equal lancets. The capitals of the columns exhibit over 100 varieties of treatment; indeed, there is proportionately almost as much variety of design in the cathedral as in Mr. Street's Law Courts. The south transept has been built as a memorial to the first bishop of the see, Dr. Benson, now Archbishop of Canterbury. In this transept have been placed some Jacobean and other monuments from the old church. At the south-western angle of the completed building at the end of the two bays of the future nave is a circular baptistery, open to the aisles on two sides, having a domical vault carried on from detached piers, and from others tied on to the external walls; this baptistery, which is lined with various marbles, and paved with marble mosaics, is a memorial to Henry Martyn, a Cornish missionary.
